PUBLISHERS' PREFACE.

THE first edition of the BIOGRAPHICAL DICTIONARY OF EMINENT SCOTSMEN was edited by Mr. (now Dr.) Robert Chambers. It was issued in 4 vols. demy 8vo, and completed in 1834. In his preface the Editor says:—

“A biographical dictionary of eminent natives of Scotland has been regarded as a desideratum in our national literature for the greater part of a century. Such a work was successively contemplated by Sir David Dalrymple and Mr. William Smellie, each of whom proceeded so far with the design as to write a few of the articles. When the Editor of the present Work began a few years ago to inquire into the literary and historical antiquities of his country, he found the desire of possessing a dictionary of this kind not in the least abated, but very little hope entertained that, under the existing prospects of literature, it would be possible to present such a book to the public. He proceeded, nevertheless, perhaps rather under the influence of a peculiar enthusiasm than any wiser or more considerate motive, to take upon himself a task which at least two of his predecessors had failed to accomplish, and for which he could not but feel himself to be in many respects imperfectly qualified. Sometime after beginning his labours, a fortunate alliance with his present Publishers, who had projected a similar work, removed many of the original difficulties, and he was enabled to commence the publication in 1832.

“In now taking a retrospective view of his labours, he sees, with some regret, passages which he could amend, and even one or two articles which, upon a more rigid estimate of merit, he would be disposed to omit. He has much satisfaction, however, in reflecting that very few instances of error in point of fact have been indicated to him; so that he is enabled to hope that his Work, upon the whole, makes that near approach to correctness, which is the most valuable feature in a book of reference.”

The second edition, completed in 1855, consisted of a reprint of the four volumes of the first edition, the stereotype plates of which were revised under the inspection of the Publishers, and of a fifth volume written mostly by the

Revised - \$15.00 (3/1/12/104)

Rev. Thomas Thomson. In his preface to the fifth volume Mr. Thomson says:—

“A full national Biography for Scotland, from the earliest period till 1834, was accomplished by the Work, the publication of which was completed during that year, under the title of ‘LIVES OF ILLUSTRIOUS AND DISTINGUISHED SCOTSMEN,’ of which the first four volumes of the present is a re-issue. But since the period of its first publication, circumstances have occurred through which a large addition to the original collection was urgently demanded. The close of the last, and the earlier part of the present century, have constituted an epoch in the history of the Scottish mind, such as our country, prolific though it has been of eminent men, has never previously enjoyed. But of these illustrious Scotsmen of our own day, the greater part have died since the year 1834, while they were so numerous as well as distinguished, that nothing less than an entire volume seemed necessary for their memorial. If in this estimate it should be alleged that a mistake has been made—that the worth which our own eyes have beheld, and over which the grave has so recently closed, has in some instances been rated higher than a future time and the increasing experience of society will ratify—still we trust it is a mistake which the succeeding generation will be easily disposed to pardon.

“The author of this additional volume of the ‘LIVES OF ILLUSTRIOUS AND DISTINGUISHED SCOTSMEN’ has only to add, that the following memoirs owe nothing more to him than the care of editorial revision: viz. those of Joanna Baillie, Rev. Dr. Robert Balfour, James Bell, John Burns, M.D., David Dale, Colonel John Fordyce, George Gardner, Charles Mackintosh, James Montgomery, and Thomas Thomson, M.D., F.R.S. These were derived from sources of information to which he either had no ready access, or were connected with subjects to which he thought he could not render such ample justice as they merited. For the authorship of the rest of the volume, whatever may be its merits or defects, he claims the entire responsibility.”

When the lapse of time seemed to render a new and enlarged edition of this Dictionary necessary, it was resolved to reset the whole Work, so that the biographies in the original work and in the supplemental fifth volume, and the large number of new memoirs requiring now to be introduced, might all be fused into one general alphabet. The opportunity thus presented for revising the entire Work was taken advantage of. Some memoirs which seemed to have extended to an undue length were retrenched, and others that either seemed too curt, or respecting the subjects of which additional information had become available, were partially amplified, while, following out the more rigid estimate of merit hinted at in the preface of the original edition, a few others were altogether omitted. The editor, Mr. Thomson, entered upon the task for which he was so eminently qualified quite *con amore*. He revised the whole

of the lives in the five volumes of the second edition in the manner indicated, and wrote all the hundred and forty-seven additional memoirs by which the present edition is so greatly enlarged, with exception of those of John Crawford, William Richard Hamilton, William Jerdan, Horatio M'Culloch, R.S.A., J. Beaumont Neilson, John Phillip, R.A., Charles Kirkpatrick Sharpe, James Smith of Jordanhill, Andrew Wilson, Thomas Graham, D.C.L., F.R.S., and probably a few others, which were contributed by relatives or intimate friends of the deceased persons commemorated, or written by gentlemen specially conversant with the departments of knowledge in which the subjects of the memoirs were eminent. Mr. Thomson had just finished his editorial labours by completing the memoirs for the Supplement at the end of the third volume, with exception of a couple of lives added since, when the hand of death arrested his career before the final proofs had passed through the press. An interesting memoir of this indefatigable literary labourer, contributed by his widow, has been appropriately placed in the Supplement.

There being no more interesting and instructive history than the lives of the men by whom history is made, there has been added to the work a full Chronological Index of the memoirs of which it is composed, by means of which the reader is enabled to peruse them in the sequence of their dates, and thus convert this Dictionary into an admirable biographical history of Scotland, of its kind the most complete that has hitherto been published. In addition there is appended an Alphabetical Index, in which is registered the principal authorities and sources whence the materials of the biographies were derived.

In bringing the publication of this important Work to a conclusion, the Publishers feel gratified in being able to point to the entire fulfilment of the promises made in the prospectus. For unquestionably "Among the biographies will be found a large number of an exceedingly instructive character, calculated to form incentive examples to young and ardent minds, and numerous instances of men who have risen from humble circumstances and attained to high positions, and of those who have succeeded in the pursuit of knowledge in spite of the greatest hardships and difficulties." And all must confess that it forms "a comprehensive record of the achievements of those, in every walk of life, whose memories are cherished by their countrymen, and whose deeds form the history of their country; of those who, by their energy, wisdom, or bravery, their patience, industry, learning, or writings, have been influential in preserving its freedom or maintaining the rights of its people; who have been the leaders in the progress of national civilization; and whose exertions have raised their country to that proud eminence which it now occupies among the nations of Europe."

BIOGRAPHICAL DICTIONARY

OF

EMINENT SCOTSMEN.

A.

ABERCROMBY, THE HONOURABLE ALEXANDER (Lord Abercromby), a distinguished lawyer of the latter part of the 18th century, and an elegant occasional writer, was the youngest son of George Abercromby of Tullibody, in Clackmannanshire, and brother of the celebrated Sir Ralph Abercromby. He was born on the 15th of October, 1745. While his elder brothers were destined for the army, Alexander chose the profession of the law, which was more consistent with his gentle and studious character. After going through the ordinary course of classes at the university of Edinburgh, he became, in 1766, a member of the Faculty of Advocates. He was at this early period of his life the favourite of all who knew him, not only for the uncommon handsomeness of his person, but for the extreme sweetness of his disposition. Being given to the gaieties of fashionable life, he had little relish for laborious employment; so that, for some years after his admission into the Faculty of Advocates, his splendid abilities were well-nigh obscured by indolence or frivolity. Roused at length to exertion, he engaged with ardour in all the duties of his profession, and soon became eminent for professional skill, and distinguished as a most eloquent pleader. His reputation and business rapidly increased, and soon raised him to the first rank at the Scottish bar. In May, 1792, he was appointed one of the judges of the Court of Session, when, in compliance with the custom of the Scottish judges, he adopted the title of Lord Abercromby; and, in December following he was called to a seat in the Court of Justiciary. "In his judicial capacity he was distinguished by a profound knowledge of law, a patient attention, a clearness of discernment, and an unbiassed impartiality, which excited general admiration." His literary performances and character are thus summed up by his friend Henry Mackenzie, who, after his death, undertook the task of recording his virtues and merits for the Royal Society:—"The laborious employments of his profession did not so entirely engross him, as to preclude his indulging in the elegant amusements of polite literature. He was one of that society of gentlemen who, in 1779, set on foot the periodical paper, published at Edinburgh during that and the subsequent year, under the title of the *Mirror*; and who afterwards gave to the world another work of a similar kind, the *Lounger*, published in 1785 and 1786. To these papers he was a very valuable contributor, being the author of ten papers in the *Mirror* and nine in the *Lounger*. His papers

are distinguished by an ease and gentlemanlike turn of expression, by a delicate and polished irony, by a strain of manly, honourable, and virtuous sentiment." Mackenzie states that they are also characterized by an unaffected tenderness, which he had displayed even in his speeches as a barrister. After exemplifying almost every virtue, and acting for some years in a public situation with the undivided applause of the world, Lord Abercromby was cut off by a pulmonary complaint at Falmouth, whither he had gone for his health, on the 17th of November, 1795.

ABERCROMBY, JOHN, the author of several esteemed works on gardening, was the son of a respectable gardener near Edinburgh, where he was born about the year 1726. Having been bred by his father to his own profession, he removed to London at the early age of eighteen, and became a workman in the gardens attached to the royal palaces. Here he distinguished himself so much by his taste in laying out grounds, that he was encouraged to write upon the subject. His first work, however, in order to give it greater weight, was published under the name of a then more eminent horticulturist, Mr. Mawe, gardener to the Duke of Leeds, under the title of *Mawe's Gardener's Calendar*. It soon rose into notice, and still maintains its place. The editor of a subsequent edition of this work says, "The general principles of gardening seem to be as correctly ascertained and clearly described by this author, as by any that have succeeded him." And further, "The style of Abercromby, though somewhat inelegant, and in some instances prolix, yet appears, upon the whole, to be fully as concise, and at least as correct and intelligible, as that of some of the more modern and less original of his successors." Abercromby afterwards published, under his own name, the *Universal Dictionary of Gardening and Botany*, in 4to; which was followed, in succession, by the *Gardener's Dictionary*, the *Gardener's Daily Assistant*, the *Gardener's Vade Mecum*, the *Kitchen Gardener and Hot-bed Forcer*, the *Hot-house Gardener*, and numerous other works, most of which attained to popularity. Abercromby, after a useful and virtuous life, died at London in 1806, aged about eighty years.

ABERCROMBIE, JOHN, M.D., was one of the latest of that medical school of which Scotland is so justly proud. He was born in Aberdeen, on the 11th of October, 1781, and was son of the Rev.

Mr. Abercrombie, who for many years was one of the ministers of that town, and distinguished by his piety and worth. The excellent training which John enjoyed under such a parent, imparted that high moral and religious tone by which his whole life was subsequently characterized. After a boyhood spent under the paternal roof, and the usual routine of a classical education, he was sent, in consequence of his choice of the medical profession, to the university of Edinburgh, at that time distinguished as the best medical school in the empire. Here he applied to his studies with indefatigable diligence, and while his fellow-students marked his progress with admiration, they were not less struck with the moral excellence of his character, and the deep, practical, unobtrusive piety by which, even thus early, his whole life was regulated. It was this confirmed excellence of character, expressed alike in action and conversation, combined with his high professional talents and reputation, that afterwards won for him the confidence of his patients, and imparted to his attentions at the sick-bed a charm that, of itself, was half the cure. When the usual prescribed course of study at the medical classes was finished, Mr. Abercrombie graduated at the university of Edinburgh on the 4th of June, 1803, while only in his twenty-second year, the subject of his thesis being *De Fatuitate Alpina*. He then went to London, and after a short period of study at the schools and hospitals of the metropolis, returned to Edinburgh, and was admitted a fellow of the Royal College of Surgeons on the 12th of November, 1804. On this occasion his probationary essay, submitted to the president and council, entitled *On Paralysis of the Lower Extremities from Diseased Spine*, was characterized by such clearness of thought and perspicuity of style, as fully indicated the eminence that awaited him not only in his professional capacity, but also in the ranks of authorship.

Thus prepared, Dr. Abercrombie, though still young, and almost a stranger in Edinburgh, resolved to establish himself at once as a physician in the northern capital, instead of commencing his career in some more humble district. He accordingly took a house in Nicolson Street, and as a general or family practitioner his reputation continued to grow from year to year without interruption. Even this, however, was not enough for his active and benevolent mind; and therefore, notwithstanding the increase of business, and its tempting emoluments, he gave much of his time to attendance on the poor, as one of the medical officers of the Royal Public Dispensary. Still deeming his own personal exertions insufficient, he would not rest until he had imparted his enthusiasm to others; and therefore, when his reputation in clinical knowledge had gathered round him a host of pupils emulous to follow his example, he divided the city into districts, to each of which a few of these students were attached for medical superintendence. In this way, while the health of the humblest of the population of Edinburgh was cared for, an efficient class of experienced physicians was trained for the kingdom at large. Besides this important service, on being appointed vaccinator along with Drs. Gillespie and Bryce, he was enabled to take with them an active part in introducing the practice of the Jennerian discovery into Scotland.

At length, when, after a course of years, the professional experience and reputation of Dr. Abercrombie had reached their height, an event occurred by which it was hoped their excellence would be duly honoured. This was a vacancy in the chair of medicine in the university of Edinburgh, through the death of Dr. Gregory in 1821. On this occasion

Dr. Abercrombie added his name to the list of candidates, while his friends were sanguine in the hope of his success. But town-councils are not always infallible judges of scientific attainments, and his application was unsuccessful. The following list of his writings, which he presented to the provost and town-council of Edinburgh, on announcing himself as candidate for the chair, will sufficiently show how his hours of literary leisure, amidst a throng of professional occupations extending over the preceding course of years, had been occupied and improved:—*On Diseases of the Spinal Marrow. On Dropsy; particularly on some Modifications of it which are successfully treated by Blood-letting. On Chronic Inflammation of the Brain and its Membranes, including Researches on Hydrocephalus. On Apoplexy. On Palsy. On Organic Diseases of the Brain. On a Remarkable and Dangerous Affection, producing Difficulty of Breathing in Infants. On the Pathology of the Intestinal Canal. Part I.—On Ileus. Ditto. Part II.—On Inflammation of the Bowels. Ditto. Part III.—On Diseases of the Mucous Membranes of the Bowels. On the Pathology of Consumptive Diseases. On Ischuria Renalis.*

After the decease of Dr. Gregory, Dr. Abercrombie, although unsuccessful in his application for the chair of medicine, succeeded him as consulting physician, in which situation his services were often in demand, not only in Edinburgh, but over the whole of Scotland. He was also appointed physician to the king for Scotland—a mere title, it is true, but at the same time one of those honorary titles which often stamp the value of the man, and prove a passport to the substantialities of eminence and wealth. In 1834, his reputation was so completely fixed, that the university of Oxford, departing from its usual routine in behalf of the alumni of Scottish colleges, conferred on him the honorary degree of Doctor of Medicine, and in the following year he was elected lord-rector of the Marischal College of Aberdeen. Besides these, he held other offices of distinction, most of which were connected with benevolent societies. In this way his life went onward, and while he increased in wealth and professional reputation, his piety made him the friend of the good, and his benevolence the honoured of the poor. But all was brought to an abrupt termination by his sudden death, at his house in York Place, on the 14th of November, 1844. On the morning of that day, having breakfasted at nine o'clock, he retired to his private room, while several patients were waiting for him, and his carriage standing at the door. As nearly an hour elapsed, his servant, alarmed at such unusual delay, entered the room, and found his master lying extended and lifeless on the floor, his death having been apparently all but instantaneous. It was found, on a *post mortem* examination, that the cause of his death was the bursting of a coronary artery. Thus unexpectedly was closed the life of one whom all classes esteemed, and whose loss is still felt and remembered.

Dr. Abercrombie was distinguished not only as a most eminent and successful medical practitioner, but also as an able and eloquent writer. At first his exertions in authorship were confined to the *Edinburgh Medical and Surgical Journal*, and other similar professional periodicals; but when his literary strength was matured, he produced a separate treatise entitled *Pathological and Practical Researches on Diseases of the Brain and the Spinal Cord*, Edinburgh, 1828, 8vo. This work, which abounds in pure scientific knowledge, and evinces his profound research into mental character, as con-

nected with physical condition and action, was followed in the same year by another of still higher merit, having for its title *Pathological and Practical Researches on the Diseases of the Intestinal Canal, Liver, and other Viscera of the Abdomen*, Edinburgh, 1828, 8vo. These, however, though so highly meritorious, were but prelusive efforts to something still more important; and after a careful study and arrangement of the materials which he had been accumulating for years, he produced two works; the one entitled *Inquiries concerning the Intellectual Powers, and the Investigation of Truth*, Edinburgh, 1830, 8vo; and the other, *The Philosophy of the Moral Feelings*, London, 1833, 8vo. Upon these works, of which the latter is a sequel to the former, his literary reputation will chiefly rest; and they will always continue to be prized by the reflective mind, from the views which they unfold of the intellectual and moral nature of man, and the harmonious combination which exists between the truths of science and the revelations of Christianity. Independently, however, of these writings, so distinguished by their profound medical, ethical, and metaphysical knowledge, and so practical in their bearings, Dr. Abercrombie's pen was employed on the subjects of humble every-day usefulness, and pure unmixt religion and vital godliness; so that shortly after the publication of his *Philosophy of the Moral Feelings*, he produced his *Treatise on the Moral Condition of the Lower Classes in Edinburgh*; and subsequently, *The Elements of Sacred Truth*, which were first published singly and at intervals, and afterwards collected into a small volume. "These tracts," an able reviewer has observed, "reflect the highest honour on Dr. Abercrombie. It is beautiful to see an individual of his professional celebrity thus dedicating his talents and a portion of his time to religious instruction. Such an example is above all praise."

ABERCROMBY, PATRICK, historian, was the third son of Alexander Abercromby of Fetterneir, in Aberdeenshire, a branch of the house of Birkenbog in Banffshire, which again derived its descent from Abercromby of Abercromby in Fife. Francis, the eldest son of Abercromby of Fetterneir, was created Lord Glassford in 1685; but as the patent, by an extraordinary restriction, was limited to his own life only, the title did not descend to his children. Patrick Abercromby was born at Forfar in 1656, and was educated at the university of St. Andrews, where he took the degree of Doctor in Medicine in 1685. His family being eminently loyal, the young physician is said to have changed his religion to please James VII., who consequently made him one of the physicians of the court. A proceeding so dishonest and time-serving was speedily and severely punished; for, at the Revolution, Abercromby was deprived of his appointment. For some years after he appears to have lived abroad; but he returned to Scotland in the reign of Queen Anne, and devoted himself to the study of national antiquities. In 1707, he published a translation of M. Beauge's very rare book, *L'Histoire de la Guerre d'Ecosse, 1556*, under the title of *The History of the Campaigns 1548 and 1549*; "being an exact account of the Martial Expeditions performed in those days by the Scots and French on the one hand, and the English and their foreign auxiliaries on the other: done in French by Mons. Beauge, a French gentleman; with an introductory preface by the Translator." In the preface, the ancient alliance between Scotland and France is strenuously asserted. This curious French work, which gives a complete account of the

war carried on by the Popish government of Cardinal Beaton, aided by the French, against the English under Protector Somerset, was reprinted in the original by Mr. Smythe of Methven for the Bannatyne Club, 1829, along with a preface, giving an account of Abercromby's translation. The great work of Dr. Abercromby is in two volumes, folio, entitled, *The Martial Achievements of the Scots Nation*. He tells us in the preface, that, not venturing to write regular history or biography, he had resolved to relate the deeds of all the great men of his country, in a less ambitious strain, and with a more minute attention to small facts, than is compatible with those styles of composition. He also, with great modesty, apologizes for his manner of writing by saying, "When my reader is told that 'twas my fate to spend most part of my youth in foreign countries, to have but viewed, *en passant*, the south part of Britain, and to have been conversant with Koman and French rather than with English authors, he will not expect from me those modish turns of phrase, nor that exact propriety of words, Scotsmen, by reason of their distance from the fountain of custom, so seldom attain to." The first volume of the *Martial Achievements* was published, in 1711, by Mr. Robert Freebairn, and shows a respectable list of subscribers. About one-half of it is occupied by the early fabulous history of Scotland, in which the author, like almost all men of his time, and especially the Jacobites, was a devout believer. It closes with the end of the reign of Robert Bruce. The second volume appeared, with a still more numerous and respectable list of subscribers, in 1715; it was partly printed by Freebairn, and partly by Thomas Ruddiman, who not only corrected the manuscript, but superintended its progress through the press. This is said by Chalmers to have been the first typographical effort of Ruddiman. Abercromby's *Martial Achievements* is upon the whole a very creditable work for a Scottish antiquary of that period; the author is not superior to the credulity of his age and party, but he is eminently industrious, and his narrative is written in an entertaining style. The work shows a wide range of authorities, and is liberally interspersed with controversial discussions of the points most contested by antiquaries. Dr. Patrick Abercromby died poor in 1716, or, as other writers say, in 1726, leaving a widow in distressed circumstances.

ABERCROMBY, SIR RALPH, a distinguished general, under whom the British arms met their first success in the French revolutionary war, was the eldest son of George Abercromby of Tullibody, in Clackmannanshire, a gentleman of ancient and respectable family, and of Mary, daughter of Ralph Dundas of Manor. He was born at Menstrie, in the parish of Logie, on the 7th October, 1734. His education seems to have been regarded with more care than was usually manifested by the Scottish country gentlemen of the early and middle parts of the last century. After passing through the customary course at Rugby, he became a student, first in the university of Edinburgh, and subsequently in that of Göttingen. He entered the army, as cornet in the 3d dragoon guards, May 23, 1756, and became a lieutenant, in the same regiment, in the year 1760; which rank he held till April, 1762, when he obtained a company in the 3d horse. In this regiment he rose, in 1770, to the rank of major, and in 1773 to that of lieutenant-colonel. He was included in the list of brevet-colonels in 1780, and in 1781 was made colonel of the 103d, or king's Irish infantry, a new regiment, which was broken at the peace in 1783, when Colonel Abercromby was placed on half-pay.

It may be noticed in passing that he represented the shire of Kinross in the British parliament from 1774 till 1780; but made no attempt to render himself conspicuous, either as a party-man or as a politician. In September, 1787, he was promoted to the rank of major-general, and next year obtained the command of the 60th foot. From this corps he was, in 1792, removed to the 6th foot: from that again to the 5th; and in November, 1796, to the 2d dragoons, or Scots Greys.

On the breaking out of the French revolutionary war, Abercromby held the local rank of lieutenant-general, and served with distinguished honour in the campaigns of 1794 and 1795, under the Duke of York. He commanded the advanced-guard in the affair of Cateau (April 16, 1794), in which Chapuy, the French general, was taken prisoner, and thirty-five pieces of cannon fell into the hands of the British. In the reverses that followed, the British army escaped entire destruction solely by the masterly manœuvres of Abercromby, who was second in command. He was wounded at Nimeguen, in the month of October following; notwithstanding which, the arduous service of conducting the retreat through Holland in the dreadfully severe winter of 1794, was devolved wholly upon him and General Dundas. Than this retreat nothing could be conceived more calamitous. The troops did all that could be expected from them in their trying situation. Oppressed by numbers, and having lost all their stores, they made good their retreat in the face of the foe, amidst the rigours of a singularly severe winter; while for the removal of the sick, nothing could be procured but open waggons, in which they were exposed to the intense severity of the weather, to drifting snows and heavy falls of sleet and rain. The mortality, of course, was very great. The regiments were so scattered, marching through the snow, that no returns could be made out, and both men and horses were found in great numbers frozen to death. "The march," says an eye-witness, "was marked by scenes of the most calamitous nature. We could not proceed a hundred yards without seeing the dead bodies of men, women, children, and horses, in every direction. One scene," adds the writer, "made an impression on my mind which time will never be able to efface. Near a cart, a little further in the common, we perceived a stout-looking man and a beautiful young woman, with an infant about seven months old at the breast, all three frozen dead. The mother had most certainly died in the act of suckling her child, as, with one breast exposed, she lay upon the drifted snow, to all appearance, in a stream drawn from the nipple by the babe, and instantly congealed. The infant seemed as if its lips had just then been disengaged, and it reposed its little head upon the mother's bosom, with an overflow of milk frozen as it trickled down from its mouth. Their countenances were perfectly composed and fresh, as if they had only been in a sound and tranquil slumber." The British army reached Deventer after incredible exertion, on the 27th of January, 1795; but they were not able to maintain the position, being closely pursued by a well-appointed army, upwards of 50,000 strong. They continued their progress, alternately fighting and retreating, till the end of March, when the main body, now reduced one-half, reached Bremen, where they were embarked for England.

While the French were making those gigantic efforts at home which confounded all previous calculations in European warfare, their struggles abroad were equally startling. They repossessed themselves in the West Indies of Guadeloupe and St. Lucia,

established a landing upon several points in the island of Martinique, and made partial descents on the islands of St. Vincent, Grenada, and Marie Galante. In these various incursions they plundered, in the several islands, property to the amount of one thousand eight hundred millions of livres (about £72,000,000). To put an end to these ruinous depredations, a fleet was fitted out in the autumn of the year 1795, for the purpose of conveying a military force to the West Indies; and the charge of the land troops was given to Sir Ralph Abercromby, with the appointment of commander-in-chief. He took the command, and hastened the embarkation; and although the equinox overtook them, so that several of the transports were lost in the Channel, the fleet made the best of its way to the West Indies, and by the month of March, 1796, the troops were landed and in active operation. St. Lucia was speedily captured by a detachment of the army under Sir John Moore, as were St. Vincent and Grenada by another under General Knox. The Dutch colonies, Demerara, Essequebo, and Berbice, on the coast of Guiana, likewise fell into the hands of the British about the same time, almost without stroke of sword. The remainder of 1796 having been thus employed, Sir Ralph made preparations for attacking, early in 1797, the Spanish island of Trinidad. For this purpose, the fleet sailed with all the transports, from the island of Curacao on the morning of the 15th February, 1797, and next day passed through the Barns into the Gulf of Bria, where they found the Spanish admiral, with four sail of the line and one frigate, at anchor, under cover of the island of Gaspagrande, which was strongly fortified. The British squadron immediately anchored opposite, and almost within gunshot of the Spanish ships. The frigates, with the transports, were sent to anchor higher up the bay, at the distance of about five miles from the town of Port d'Espagne. Dispositions were immediately made for attacking the town and the ships of war next morning by break of day. By two o'clock of the morning, however, the Spanish squadron was observed to be on fire. The ships burned very fast, one only escaping the conflagration, which was taken possession of by the British. The Spaniards, when they set their ships of war on fire, had also evacuated the island. The troops under Sir Ralph Abercromby were of course landed without opposition, and the whole colony fell into the hands of the British. Sir Ralph next made an attack upon Porto Rico, in which he was unsuccessful; and shortly after he returned to Britain, and was received with every mark of respect. He had, in his absence, been complimented with the colonelcy of the second dragoons or Scots Greys, and nominated governor of the Isle of Wight. He was now (1797) advanced to the dignity of the Bath, raised to the rank of a lieutenant-general, and invested with the lucrative governments of Fort George and Fort Augustus.

The disturbed state of Ireland at this time calling for the utmost vigilance, Sir Ralph Abercromby was appointed to the command of the forces in that unhappy country, where he exerted himself most strenuously, though with partial success, to suppress rebellion and preserve order. He was particularly anxious, by the strictest discipline, to restore the reputation of the army; for, according to his own emphatic declaration, it had become more formidable to its friends than to its enemies. During this command he did not require to direct any military operations in person; and the Marquis Cornwallis having received the double appointment of lieutenant and commander-in-chief of the forces, Sir

Ralph transferred his head-quarters to Edinburgh, and, on 31st of May, assumed the command of the forces in Scotland, to which he had been appointed.

In the year 1799, an expedition having been planned for Holland to restore the Prince of Orange to the stadtholdership, Sir Ralph was again selected to take the chief command. The troops destined for this service sailed on the 13th of August, under convoy of the fleet commanded by Vice-admiral Mitchell, and, after encountering heavy gales, came to anchor off the Texel, on the 22d of the month. On the 27th the troops were disembarked to the south-west of the Helder point, without opposition. Scarcely had they begun to move, however, when they were attacked by General Daendels, and a warm but irregular action was kept up from five o'clock in the morning till five in the afternoon, after which the enemy retired, leaving the British in possession of a ridge of sand-hills stretching along the coast from south to north. In this day's evolutions the enemy lost upwards of 1000 men, and the British about half that number. Encouraged by this success, Sir Ralph Abercromby determined to seize upon the Helder next morning, when he would be in possession of a seaport, an arsenal, and a fleet. The brigades of Generals Moore and Burrard were ordered to be in readiness to make the attack early in the morning; but the garrison was withdrawn through the night, leaving a considerable train of artillery, a naval magazine, thirteen ships of war, and three Indiamen, which fell into the hands of the British without opposition. Admiral Mitchell immediately stood down into the Texel, and offered battle to the Dutch fleet lying there; the whole of which, consisting of twelve sail of the line, surrendered to the British admiral, the sailors refusing to fight, and compelling their officers to give up the ships for the service of the Prince of Orange. Taking the surrender of the fleet as the criterion of Dutch feeling, the most extravagant hopes of the success of the expedition were entertained by the people of England; but the sentiments of the Hollanders, generally, were not as yet in unison with those of the sailors, and every precaution was taken for defence. The British army, in the meantime, left the sand-hills and took up a new position, their right extending to Petten, on the German Ocean, and their left to Oude Sluys on the Zuider Zee. A fertile country was thus laid open to the invaders; while the canal of Zuyper, immediately in front, contributed to strengthen their position, enabling them to remain on the defensive until the arrival of additional forces. At daybreak of 11th September, the combined Dutch and French army attacked the centre and right of the British lines, from St. Martins to Petten, with a force of 10,000 men, which advanced in three columns; the right, composed of Dutch troops commanded by General Daendels, against St. Martins; the centre, under De Monceau, upon Zuyper Sluys; and the left, composed entirely of French troops under General Brune, upon Petten. The attack, particularly on the left and centre, was made with the most daring intrepidity, but was repulsed by the British, and the enemy lost upwards of 1000 men. On this occasion, General Sir John Moore was opposed to General Brune, and distinguished himself by the most masterly manoeuvres; and, had the British been sufficiently numerous to follow up their advantage, the United Provinces might have shaken off the French yoke even at this early period. The want of numbers was felt too late; but, to remedy the evil, the Russian troops engaged for the expedition were hastily embarked at the ports of Cronstadt and

Revel, to the number of 17,000, under the command of General D'Hermann, and were speedily upon the scene of action. The Duke of York now arrived as commander-in-chief; and his army, with the Russians and some battalions of Dutch troops, formed of deserters from the Batavian army and volunteers from the Dutch ships, amounted to upwards of 36,000 men, a force considerably superior to that under Generals Daendels and Brune. In consequence of this, the Duke of York, in concert with D'Hermann, made an immediate attack upon the enemy's position, which was on the heights of Camperdown, and along the high sand-hills extending from the sea, in front of Petten, to the town of Bergen-op-zoom. The enemy's deficiency of numbers was far more than counter-balanced by the advantages of their position; improved, as it was, by strong entrenchments at the intermediate villages, and by the nature of the ground, intersected by wet ditches and canals, whose bridges had been removed, and the roads rendered impassable, either by being broken up, or by means of felled trees stuck in the earth, and placed horizontally, so as to present an almost impenetrable barrier. The attack, however, notwithstanding all disadvantages, was made with the most determined resolution, early on the morning of the 19th of September, and was successful at all points. By eight o'clock in the morning, the Russians, under D'Hermann, had made themselves masters of Bergen-op-zoom; but they no sooner found the place evacuated, than they flew upon the spoil, and began to plunder the citizens whom they had professedly come to relieve. The vigilant enemy seized the opportunity to rally his broken battalions, and, being reinforced from the garrison at Alkmaar, attacked the dispersed Russians with so much impetuosity, that the latter were driven from Bergen-op-zoom to Schorel, with the loss of Generals D'Hermann and Tcherchekoff, wounded and taken prisoners. This failure of the Russians compelled the other three columns of the British army to abandon the positions they had already stormed, and return to the station they had left in the morning. For this disappointment 3000 prisoners taken in the engagement was but a poor recompense; while the impression made upon the minds of the Dutch by the conduct of the Russians was incalculably injurious to the objects of the expedition. The conflict was renewed on the 2d of October, by another attack on the whole line of the enemy, the troops advancing, as before, in four columns, under Generals Abercromby, D'Esson, Dundas, and Pulteney. The centre ascended the sand-hills at Campe, and carried the heights of Schorel; and, after a vigorous contest, the Russians and British obtained possession of the whole range of sand-hills in the neighbourhood of Bergen-op-zoom; but the severest conflict, and that which decided the fate of the day, was sustained by the first column under Sir Ralph Abercromby. He had marched without opposition to within a mile of Egmont-op-zee, where a large body of cavalry and infantry waited to receive him. Here Sir John Moore led his brigade to the charge in person; he was met by a counter-charge of the enemy, and the conflict was maintained till evening with unexampled fury. The Marquis of Huntly, who, with his regiment (the ninety-second), was eminently distinguished, received a wound by a musket-ball in the shoulder; and General Sir John Moore, after receiving two severe wounds, was reluctantly carried off the field. Sir Ralph Abercromby had two horses shot under him, but he continued to animate the troops by his example, and the most desperate efforts of the enemy were unavailing. Their loss in this day's

engagement was upwards of 4000 men. During the night they abandoned their posts on the Lange Dyke and at Bergen-op-zoom, and next day the British took up the positions that had been occupied by the French at Alkmaar and Egmont-op-zee. Brune having taken up a strong position between Beverwyck and the Zuyder Zee, it was determined to dislodge him before the arrival of his daily-expected reinforcements. In the first movements made for this purpose the British met with little opposition; but the Russians under General D'Esson, attempting to gain a height near Buccum, were suddenly charged by an overwhelming body of the enemy. Sir Ralph Abercromby, observing the critical situation of the Russians, hastened with his column to support them. The enemy also sent up fresh forces, and the action, undesignedly by either party, became general along the whole line, from Lemmen to the sea, and was contested on both sides with the most determined obstinacy. About two o'clock in the afternoon, the right and centre of the Anglo-Russian army began to lose ground, and retire upon Egmont; where, with the co-operation of the brigade under Major-general Coote, they succeeded in keeping the enemy in check during the remainder of the day. Evening closed over the combatants, darkened by deluges of rain; yet the work of mutual destruction knew no intermission. The fire of musketry, which ran in undulating lines along the hills, with the thunder-flash of the artillery, and the fiery train of the death-charged shell, lighted up with momentary and fitful blaze the whole horizon. About ten o'clock at night, worn out by such a lengthened period of exertion, though their mutual hostility was not in the least abated, the contending parties ceased fighting, and the British were left in possession of the ground upon which they had fought, with upwards of 2000 of their companions lying dead around them. General Brune was, in the course of the night or next morning, reinforced by an addition of 6000 men, and the ground he occupied was by nature and art rendered nearly impregnable. The British lay through the night exposed to the weather, which was terrible, on the naked sand-hills; their clothing drenched, and their arms and ammunition rendered useless by the rain. Nor was the inhospitality of the people less than that of the elements; the greater part being violently hostile, and the remainder sunk in supine indifference. Retreat was therefore a measure of necessity, and next night, the 7th of October, about ten o'clock, amidst a deluge of rain, the troops marched back to their former station at Petten and Alkmaar, which they reached without immediate pursuit or any serious loss. To embark, however, upon such a shore, and in the face of such an enemy, without great loss was impossible; and, to prevent the unnecessary effusion of blood, an armistice was proposed by the Duke of York, till the troops should be quietly embarked. The French general was willing to accede to the proposal, provided the Dutch fleet were restored, and all forts, dykes, &c. &c., left as they had been taken; or, if any improvements had been made upon them, in their improved state. To the first part of the proposal the duke utterly refused for a moment to listen; and, being in possession of the principal dykes, he threatened to break them down and inundate the country. The fleet was not given up; but in lieu thereof, 8000 French and Dutch prisoners, that had been taken previous to this campaign, were to be restored, with all that had been taken in it, the Dutch seamen excepted. The troops were instantly embarked, and safely landed in England, with the

exception of the Russians, who were landed in the islands of Guernsey and Jersey. Though this expedition totally failed in its main object—the liberation of Holland—it was not without advantage. The capture of the Dutch fleet, in the then state of affairs, was of very considerable importance. Nor was the impression it left upon the enemy of the superior skill of British officers, particularly of the subject of this memoir, and the daring valour of British troops, without its use in the succeeding periods of the war.

Sir Ralph Abercromby, now a universal favourite, and esteemed the most skilful officer in the British service, was appointed in the month of June, 1800, to command the troops sent out upon a secret expedition to the Mediterranean, and which were for the time quartered on the island of Minorca, where he arrived on the 22d of June. The very next day the troops were embarked for Leghorn, where they arrived on the 9th of July; but in consequence of an armistice between the French and the Austrians, they were not allowed to land. Part of them now proceeded to Malta, and the remainder sailed back to Minorca. Sir Ralph himself returned to that island on the 26th of July, and on the 3d of September the troops were again embarked, and on the 14th the fleet came to anchor off Europa Point in the Bay of Gibraltar. On the 20th the armament sailed for the Bay of Tetuan to procure water, and on the 23d returned to Gibraltar. In a few days the fleet was again ordered to rendezvous in the Bay of Tetuan; and, on the 30th of October, the whole, consisting of upwards of two hundred sail, came to anchor off Cadiz, and preparations were made for landing the troops without delay. On the 6th the troops got into the boats, and everything was ready for the disembarkation. In consequence of a flag of truce from the shore, the landing was delayed, and in the afternoon the troops returned to their respective ships. The negotiations between the commanders having failed, the order was renewed for disembarking the troops next day. This order was again countermanded about midnight; the morning became stormy, and at break of day the signal was made for the fleet to weigh, and by the afternoon the whole fleet was again under sail. Part of the forces were now ordered for Portugal under the command of General Sir James Pulteney, and the remainder for Malta, where they arrived about the middle of November. Than this sailing backwards and forwards, nothing was ever exhibited more strongly indicative of extreme folly and absolute imbecility in the national councils.

It was now resolved by the British government to drive the French out of Egypt, and the armament which had uselessly rolled about the Mediterranean for so many months, was appointed for that purpose. Sir Ralph Abercromby, accordingly, embarked at Malta on the 20th of December for the Bay of Marmorice, on the coast of Caramania; where cavalry horses were to be procured, and stores collected for the expedition, which, it was calculated, would sail for Alexandria by the 1st of January, 1801. Many things, however, occurred to retard their preparations. Among others of a like nature, three hundred horses, purchased by order of Lord Elgin, the British ambassador at Constantinople, were found, when they arrived at Marmorice, so small and so galled in their backs, as to be of no use, so that it was found necessary to shoot some, and to sell others at the low price of a dollar a-piece. It was believed that Lord Elgin had paid for a very different description of horses, but the persons to whose care they had been confided had found their account in chang-

ing them by the way. Good horses were procured by parties sent into the country for that purpose; but the sailing of the expedition was in consequence delayed till the end of February, instead of the first of January, as had been originally intended; and from the state of the weather, and other casualties, the landing could not be attempted before the 8th of March, on which day it was accomplished in Aboukir Bay, in a manner that reflected the highest honour on the British troops. During this delay Bonaparte had found means to reinforce his army in Egypt, and furnish it with all necessary stores; and the weather preventing the immediate disembarkation of the troops, enabled the French to make every preparation to receive them. The sand-hills which form the coast they had lined with numerous bodies of infantry, and every height was bristling with artillery. A most tremendous discharge of grapeshot and shells from the batteries, and of musketry from the infantry that lined the shore, seemed for a moment to stay the progress of the boats as they approached. But it was only for a moment. The rowers swept through the iron tempest to the beach; the troops leaped on shore, formed as they advanced, and rushing up the slippery declivity without firing a shot, drove the enemy from their position at the point of the bayonet. Successive bodies, as they were disembarked, proceeded to the help of their precursors; in spite of every obstruction, the whole army was landed before night; and Sir Ralph Abercromby, advancing three miles into the country, took up a position with his right resting upon Lake Madyeh or Aboukir, and his left stretching to the Mediterranean. On the 12th he moved forward to attack the French, who were most advantageously posted on a ridge of sand-hills, their right towards the sea, and their left resting upon the canal of Alexandria. On the morning of the 13th, the army marched in two lines by the left, to turn the right flank of the enemy. Aware of this, the French, with their whole cavalry, and a considerable body of infantry, poured down from the heights and attacked the heads of both lines, but were repulsed by the advanced-guard, consisting of the 90th and 92d regiments, with incomparable gallantry. The first line then formed into two, and advanced, while the second line turned the right of the French army, and drove it from its position. The enemy, however, made a regular retreat, and contested every inch of ground till they had reached the heights of Nicopolis, which form the principal defence of Alexandria. Anxious to carry these heights, Sir Ralph Abercromby unfortunately ordered forward the reserve under Sir John Moore, and the second line under General Hutcheson, to attack (the latter the right, and the former the left) both flanks at once. Advancing into the open plain, they were exposed to the whole range of the enemy's shot, which they had it not in their power to return; and, after all, the position was found to be commanded by the guns of the forts of Alexandria, so that it could not have been kept though they had stormed it. They were accordingly withdrawn, but with a most serious loss of men; and the British army took up the ground from which the enemy had been driven, occupying a position with its right to the sea and its left to the canal of Alexandria; a situation of great advantage, as it cut off all communication with Alexandria, except by the way of the desert. In this action, Sir Ralph was nearly enveloped in the charge of the French cavalry, and was only saved by the intrepidity of the 90th regiment. The garrison of Aboukir surrendered on the 18th; but to counterbalance this advantage,

the French commander-in-chief, Menou, arrived at Alexandria from Cairo on the 20th, with a reinforcement of 9000 men. Expecting to take the British by surprise, Menou, next morning, March the 21st, between three and four o'clock, attacked their position with his whole force, amounting to from 11,000 to 12,000 men. The action was commenced by a false attack on the left, their main strength being directed against the right, upon which they advanced in great force and with a prodigious noise, shouting, "Vive la France! Vive la Republique!" They were received, however, with perfect coolness by the British troops, who not only checked the impetuosity of the infantry, but repulsed several charges of cavalry. Greater courage was perhaps never exhibited than on this occasion: the different corps of both nations rivalled each other in the most determined bravery, and presented the extraordinary spectacle of an engagement in front, flanks, and rear, at the same time; so much were the contending parties intermingled. Nine hundred of Bonaparte's best soldiers, and from their tried valour denominated Invincibles, succeeded in turning the right of the British, between the walls of a large ruin and a battery. Three times did they storm the battery, and three times were the successive parties exterminated. Getting at last into the rear of the reserve, the 42d and the 28th regiments charged them with the bayonet, and drove them step by step into the inclosure of the ruin; where, between 600 and 700 of them being already stretched lifeless on the ground, the remainder called out for quarter, and were made prisoners. Not one of them returned. Equally determined was their attack on the centre, and it was there repelled with equal success. A heavy column having broken through the line, the cavalry accompanying it wheeled to their left and charged the rear of the reserve; but this charge was broken by the accidental state of the ground, which had been excavated into pits about three feet deep, for the men to sleep in before the arrival of their camp equipage. Over these holes they had to make their charge, and in consequence were completely routed, more than 300 of them being left dead on the spot. Finding all his movements frustrated, Menou at length ordered a retreat, which he was able to effect in good order; the British having too few cavalry to pursue. His loss was supposed to be between 3000 and 4000 men, including many officers, among whom were General Raize, commander of the cavalry, who fell in the field, and two generals who died of their wounds. The loss of the British was also heavy, upwards of seventy officers being killed, wounded, and missing. Among these was the lamented commander-in-chief. Having hastened, on the first alarm, towards the cannonading, Sir Ralph must have ridden straight among the enemy, who had already broken the front line and got into its rear. It was not yet day, and being unable to distinguish friend from foe, he must have been embarrassed among the assailants, but he was extricated by the valour of his troops. To the first soldier that came up to him, he said, "Soldier, if you know me, don't name me." A French dragoon, at the moment, conjecturing the prize he had lost, rode up to Sir Ralph, and made a cut at him, but not being near enough, only cut through the clothes, and grazed the skin with the point of his sabre. The dragoon's horse wheeling about, brought him again to the charge, and he made a second attempt by a lunge, but the sabre passed between Sir Ralph's side and his right arm. The dragoon being at the instant shot dead, the sabre remained with the general. About the

same time it was discovered that he had been wounded in the thigh, and was entreated to have the wound examined; but he treated it as a trifle, and would not for a moment leave the field. No sooner, however, had the enemy begun to retreat, and the excitement of feeling under which he had been acting to subside, than he fainted from pain and the loss of blood. His wound was now examined, and a large incision made in order to extract the ball, but it could not be found. He was then put upon a litter, and carried aboard the *Foudroyant*, where he languished till the 28th, when he died. His body was interred in the burial-ground of the commandery of the grand-master, under the walls of the castle of St. Elan, near the town of Valetta in Malta.

Of the character of Sir Ralph Abercromby there can be but one opinion. Bred to arms almost from his infancy, he appeared to be formed for command. His dispositions were always masterly, and his success certain. He had served in America, in the West Indies, in Ireland, in the Netherlands, in Holland, and in Egypt; and had in all of these countries gained great distinction. In the two latter countries, especially, he performed services that were of incalculable advantage to his country. The battle of the 21st of March, or of Alexandria, while it decided the fate of Egypt, left an impression of British skill and of British valour upon the minds of both her friends and her enemies, that materially contributed to the splendid results of a contest longer in continuance, and involving interests of greater magnitude, than Britain had ever before been engaged in. The manner in which he repressed the licentiousness of the troops in Ireland was at once magnanimous and effective; and he ended a life of dignified exertion by a death worthy of a hero. "We have sustained an irreparable loss," says his successor, "in the person of our never enough to be lamented commander-in-chief, Sir Ralph Abercromby; but it is some consolation to those who tenderly loved him, that, as his life was honourable, so was his death glorious. His memory will be recorded in the annals of his country, will be sacred to every British soldier, and embalmed in the recollection of a grateful posterity."¹

Sir Ralph Abercromby was married to Mary Anne, daughter of John Menzies of Fernton, Perthshire; by whom he had issue four sons and three daughters, who survived him. On the official account reaching England of the fate of her lamented husband, his widow was elevated to the peerage, May 28th, 1801, as Baroness Abercromby of Aboukir and Tullibody, with remainder to the heirs-male of the deceased general; and, on the recommendation of his majesty, the House of Commons, without one dissentient voice, granted an annuity of two thousand pounds to Lady Abercromby, and the next two succeeding male heirs of the body of Sir Ralph Abercromby, to whom the title of Baron Abercromby should descend. The House of Commons, farther, sensible of the great merits of this distinguished British commander, voted a monument to his

memory, at the public expense, which was subsequently erected in St. Paul's Cathedral.

ABERDEEN, GEORGE HAMILTON GORDON, FOURTH EARL OF. This distinguished Conservative statesman was the eldest son of George, Lord Haddo, eldest son of the third Earl of Aberdeen, and was born in Edinburgh on the 28th of January, 1784. He was not only born but educated in Toryism; and on being sent at the early age of ten to England, his chief guardians and directors were William Pitt and Lord Melville. While he was thus trained to political life, its particular bias in politics was also determined; and the Tory boy was father of the future legislator and statesman. His classical education was conducted first at the school of Harrow, and afterwards at St. John's College, Cambridge. His father, Lord Haddo, having previously deceased, the subject of our memoir, on the death of his grandfather at the commencement of the present century, became Earl of Aberdeen. As the short-lived peace of Amiens opened Europe to British tourists, the young earl availed himself of the opportunity by visiting France, and other parts of the continent, and collecting that practical knowledge of men and things which was afterwards available in his future career; he also visited Greece, the adopted country of the scholar and man of taste, and returned to England through Turkey and Russia. This visit to Greece, the oppressed and fallen, where everything was in such contrast to its old heroic monuments and remembrances, and the classical taste and knowledge which he brought to such a study, awoke, as was natural, the young earl's highest enthusiasm; and on returning home, one of his first acts was to establish the "Athenian Society," an essential rule of which was that every member should have visited Greece. He also contributed to the *Edinburgh Review* an elaborate article on the Topography of Troy; and wrote an introduction to Wilkins' translation of Vitruvius, in which he illustrated the beauties of the ancient Grecian architecture. But such ardour, however commendable in itself, was turned by his opponents into ridicule, the full brunt of which was brought to bear against him by Lord Byron himself, the most enthusiastic of Philhellenists; who, in his *English Bards and Scotch Reviewers*, dubbed him as "that travelled thane, Athenian Aberdeen." But something deeper than mere political pique may have embittered the sarcasm of Lord Byron. The estate of Gicht, which should have descended to his mother, had been sold by her improvident father to Lord Haddo, and the poetical peer may have felt indignant that the earl, however innocently, had supplanted him in the family possession.

In 1804 the Earl of Aberdeen took the degree of M.A. at the university, and in 1806, when he had arrived at the age of twenty-two, he commenced his public life by being elected a representative peer of Scotland. The condition, however, of public affairs was such as might well daunt a young aspirant for political place and responsibility. The peace of Amiens had been quickly terminated, and the war resumed more violently than ever. The victory of Trafalgar, indeed, had secured our supremacy by sea; but this was more than counterbalanced by the successes of Napoleon on land, which already had made him the arbiter of the fate of Europe. Wellington had not as yet appeared upon the scene; and our military expeditions, unwisely planned, had generally ended in disaster and defeat. In such a state of affairs, when the wisdom of the oldest and most experienced of our politicians was at fault, the conduct of the youthful senator was characterized by modest

¹ The following panegyric upon Sir Ralph in another character was written before his death:—"As a country gentleman, ever attentive to all within the circle of his movement, he stands high in the estimation of his neighbours and dependants; and when his military glory shall have fallen into oblivion, it will be gratefully remembered that he was the friend of the destitute poor, the patron of useful knowledge, and the promoter of education among the meanest of his cottagers: as an instance it may be mentioned, that in the village of Tullibody, on his paternal estate, a reading school, under his immediate inspection, was established many years back."—*Campbell's Journey through Scotland*, 4to, 1802, vol. ii.

discretion; and although he steadily supported his party, his voice was seldom heard in the arena of discussion and debate. It was not indeed as a political orator that he was to win his way to influence and distinction, and this general silence distinguished the whole of the earl's public career to the end. But his talents were not the less felt; so that after the reverses of Napoleon in Russia, he was selected for a task of peculiar difficulty and delicacy: this was to detach the Emperor of Austria from the interests of Bonaparte, although his son-in-law, and induce him to unite with the allied sovereigns for his overthrow. That the Earl of Aberdeen should have been chosen for such a mission—on the success of which the fate of Europe depended—shows the estimation in which he was held, although as yet he was scarcely thirty years old. The result of his negotiations justified the choice of our statesmen; and his proceedings at the court of Vienna, as British ambassador, form an important portion of the history of the period. But instead of a full detail, we can only give a passing notice of their effects. Austria was, in the first instance, persuaded to become neutral; she next ventured to mediate between the contending parties; afterwards, to perform the part of mediator with effect, she found it necessary to suspend the alliance subsisting between her and France; and finally, in 1813, she joined the coalition against Napoleon. The reverses of the French arms in the Peninsula, the indecisive victories of Bonaparte at Lützen and Bautzen, the promise of a large subsidy from the British government to aid Austria in the struggle, and the prospect of reconstructing her broken dominion upon the downfall of the conqueror of Europe, were inducements too alluring to be disregarded; and the Emperor of Austria became the hostile opponent of a son-in-law whose day of prosperity was evidently drawing to a close.

In those subsequent victories by which the armies of Bonaparte were overthrown, the Earl of Aberdeen, from his attendance on the Emperor of Austria, saw a large amount of the horrors of war in their worst forms—an experience which may either have created or confirmed that love of peace and non-intervention by which his administration was afterwards characterized, and for which he was so heavily blamed. He witnessed the fights of Lützen and Bautzen; after the battle of Dresden Moreau died in his quarters; with Humboldt he rode over the field of Leipsic, when it was freshly torn by the ploughshare of military destruction; and on one occasion, near Chaumont, both emperor and ambassador, with their whole diplomatic staff, had to ride for their lives to escape the enemy, and never draw bridle until they had reached Dijon, about thirteen leagues distant. But besides a knowledge of the evils of war, with which such incidents made him personally acquainted, his situation as ambassador brought him frequently into contact with Prince Metternich and other foreign statesmen, by whose society his Conservative principles are supposed to have been strengthened, and his policy as foreign minister of Britain afterwards so materially influenced. After securing the Emperor of Austria to the cause of the allied sovereigns, the Earl of Aberdeen was commissioned to withdraw Joachim Murat, King of Naples, from the cause of his brother-in-law Napoleon, who had trained him to greatness, and to whom he owed everything. Diplomacy has duties every whit as stern and unmerciful as those of war, although they are more coolly and dispassionately performed; and the task of Aberdeen, which was to sow dissension among the kindred of the falling hero, and detach them from his cause, was by no means pleasant, however justified by

political necessity. Here also the earl was successful; and he "of the snow-white plume," the crowned dragoon who had so often in battle been Bonaparte's right arm, joined the allies, on the promise of being confirmed in his Neapolitan throne. These alienations of his best supports, by which the downfall of the French emperor was insured more effectually than by his reverses in the field, were chiefly owing to the young Scottish statesman who, silently and with his pen, was directing those movements under which the greatest of conquerors succumbed. The earl remained in attendance upon the Austrian emperor until the termination of the war, and was present as British ambassador at Chatillon, where the congress of the allied sovereigns was assembled. When so many difficult claims were to be adjusted, it was necessary that Britain, the paymaster of the war, should be fully represented; and thither accordingly Lord Castlereagh, our foreign secretary, and Sir Charles Stuart (afterwards Marquis of Londonderry) were sent as colleagues to Aberdeen and Lord Cathcart. It was a curious destination, by which two Irishmen were balanced by two Scots, as if the fervour of the one nation was to be kept in check by the proverbial cautiousness of the other. At the termination of the war in 1814, the Earl of Aberdeen was advanced to a British peerage by the title of Viscount Gordon.

On the return of the earl to England with the high political prestige he had won, it might have been expected that he would devote himself to public life, and take an important place in the administration. But previous to his mission to Vienna, his wife, a daughter of the first Marquis of Abercorn, whom he had married in 1805, died; and it is not impossible that in his acceptance of such an onerous charge, he sought the solace of a young widowed heart in the bustle of occupation. Be that as it may, when he returned home, he again sought domestic happiness by marrying the widow of Viscount Hamilton, the sister-in-law of his former wife, and mother of the second Marquis of Abercorn. Living aloof from the turmoil of politics and the allurements of ambition, he now devoted himself to those classical studies for which he had shown an early predilection, intermixed with exertions for the improvement of his estates and the comfort of his tenantry. His passion among these rural employments was chiefly the planting of trees, so that whole forests of which his old age saw the inaturity, were the reward of his early exertions. In this peaceful manner his life was spent until the year 1828, when the Tories acquired the ascendancy. In this case Lord Aberdeen was not to be overlooked, and under the administration of the Duke of Wellington he became secretary of foreign affairs. In this important office he was enabled to realize his youthful aspirations in behalf of Greece. That country, after a long, ruinous, and doubtful struggle against the overwhelming power of Turkey, had taken fresh courage from the interference of England, France, and Russia in its behalf, and the naval victory which the united fleets of these three powers had obtained over the Turco-Egyptian fleet in the battle of Navarino. In consequence of this promising change, the Greeks had renewed the unequal struggle, and, chiefly through the return of "Athenian Aberdeen" to political office, their efforts were successful; and the erection of the principal states of Greece into an independent Hellenic kingdom was the result. It was the first of a series of experiments in a great political problem, the working of which was reserved for the nineteenth century, and that still awaits solution. It may be called the problem of the resurrection of nations. A nation,

after a life of eight or ten centuries, has finished its natural term of existence, and when it expires its place is occupied by some young successor, who runs a similar career. But can a defunct nation live over again? The trial has been made in our own day, first with Greece, and afterwards with Italy, while the final issue is still an uncertainty.

With the exception of this interference in behalf of Greece, Lord Aberdeen, as secretary for foreign affairs, most scrupulously adhered to his principle of non-intervention. Thus, when Louis Philippe was recognized by the French as their king, instead of sticking for the rights of the elder branch of the Bourbons, he at once assented to the change. He refused to involve this country in a war for the displacement of Dom Miguel from the usurped throne of Portugal; and when the quadruple alliance was formed by Lord Palmerston between England, France, Spain, and Portugal, Lord Aberdeen was opposed to the measure. He also was anxious to maintain our peaceful relationships with Austria and Russia, when the popular feeling of Britain was inclined for war. But these pacific tendencies, under which our island became prosperous, were despised as the effects of a timid or selfish policy; and his lordship was alternately reproached or ridiculed as the friend of foreign despots, and the secret enemy of British liberty. Very different was the view entertained in foreign courts, where he was regarded as a wise, humane, disinterested statesman. The same peaceful character regulated his conduct in reference to our disputes with America, and it was under his direction that Lord Ashburton negotiated those difficult questions about boundaries by which a threatened war between Britain and the United States was happily averted.

The first tenure of office held by Lord Aberdeen as foreign secretary was brought to a close in 1830, by the accession of William IV., and the passing of the reform bill. But whether in or out of office, his political character was so well established, that his opinions had always weight and influence with the ruling powers. In 1834, during Sir Robert Peel's brief administration, he held office as colonial secretary, and again under that statesman in 1841, as foreign secretary; and he rendered material aid to Sir Robert in carrying the repeal of the corn-laws, and the reforms connected with our commerce. In this matter of the corn-laws, he was not obliged, like the premier and many of our statesmen, to unread his own declarations and falsify his former promises, as he had long seen the justice as well as the necessity of a repeal. The same consistency regulated his conduct in voting for the repeal of the test and corporation acts, feeling as a Presbyterian that the eucharist was profaned when used as a qualification for public office.

As Lord Aberdeen was one of the few Scottish noblemen who adhered to the national church of his own country, the events that led to the disruption in 1843 could not fail to secure his anxious attention. The two parties into which the Church of Scotland had been long divided, had at length come to hostile issue; and a conflict was inevitable, in which one or the other party must go to the wall. His endeavours to reconcile them, and prevent such a consequence, were both sincere and earnest. But the question in debate among the contending clergymen was so little understood by the laity, and the politics of the church are so different from those of the state, that the healing measures of mere diplomatists, which might prevent two nations from going to war, will sometimes only aggravate a theological controversy. Each party is persuaded that its cause is that of eter-

nal truth—that not a single pin of the sacred tabernacle can be yielded up without ruining the whole fabric—and that whosoever suggests such concession, can only be a Gallio, who cares for none of these things. Such in the present case was the fate of Lord Aberdeen, and his statesmanlike proposals for their mutual reconciliation: his healing measure for that purpose was supposed only to have hastened on the disruption which it sought to avert. The church was rent asunder, and while each party claimed to be the only true Church of Scotland, his plan, called Lord Aberdeen's Act, which had been at once rejected by the Free Church, has been found by the other an impracticable device, and a blunder in ecclesiastical polity. It will be well when statesmen cease to legislate in religious doctrines which they cannot understand, and in a spiritual government with which they should not meddle.

On the retirement of Sir Robert Peel after the corn-law bill had been carried, the Earl of Aberdeen followed his example, and on the melancholy and sudden death of the former, the earl was recognized as the head of the party called the Peelites. Although small in numbers, and suffering under the odium occasioned by the abolition of the protection duties, they were still powerful from their position and political talents. This was acknowledged when both Whigs and Tories had failed to carry on the government, so that on the downfall of the Derby-Disraeli ministry in 1852, the earl was called upon to form a new administration. He complied, and succeeded by forming a coalition not of one, but of all parties, so that the new cabinet was composed of members of every shade of political opinion from the ultra-Tory to the extreme Radical. Such a stretch of liberality, while it was demanded by the necessity of the occasion, would have found few statesmen capable of imitating.

The first great trial of the new government with Lord Aberdeen at its head, was the Russian war. The pacific principles by which his political life had been governed had now become with him a second nature, while the benefits of the long peace which had generally prevailed in Europe during forty years seemed to warrant their propriety. Here his lordship was placed in a manifest dilemma. A bold and decisive course might either arrest the outbreak, or bring it only the sooner into action. Dismayed by the uncertainty of such an experiment, Lord Aberdeen temporized, first in the hope that war might be averted, and afterwards, that although declared it would not be carried out. In this vacillation he was seconded by some of the ablest members of the cabinet, so that when the Crimean war broke out the country was only half prepared. On the events of this glorious but unfortunate war we shall not here dwell: it is enough to state, that the preparations to meet it were so defective, and the mode of carrying it on so unsatisfactory, that the public discontent compelled the cabinet to resign. His lordship quitted office on the 30th of January, 1855, and retired into private life; and while he carried with him the esteem of all parties, who acknowledged him to have been a wise and upright statesman, notwithstanding the defects of his administration, he was honoured by the queen with the order of the Garter in acknowledgment of his public services.

While his lordship's political career had thus on the whole been illustrious, and so beneficial to his country, it was in private life that his amiable qualities were best felt and appreciated. He was enthusiastically beloved by his tenants, to whom he was ever an indulgent creditor; none of them were distressed for rent or ejected for its non-payment; and

while all of them were comfortable, not a few of them became rich under such a kind considerate landlord. He also showed, even when worn out with years and sickness, that however attached to peace with foreign powers, and non-intervention in their quarrels, he was ready to prefer war to peace when the honour or safety of the country was at stake. This he showed in the volunteer movement, when apprehensions of a foreign invasion called forth such an armed demonstration. The earl was one of its strongest supporters, and his tenantry raised the second rifle corps in Aberdeenshire, which had his son, the Hon. Arthur Hamilton Gordon, for its captain. One of his last public acts was to give a proof of his heartiness in this patriotic movement. On the 2d of October, 1860, the earl invited the officers of the Methlic and Turves Volunteer rifles (his own tenants) to Haddo House, and presented to each of them a handsome and valuable sword, bearing an inscription and the name of the donor—and this, too, when he was so weak that he was obliged to sit on a couch, and had hardly strength to lift the weapons. His lordship died on the 14th December, 1860, at Argyll House, London, aged seventy-six.

ABERNETHY, JOHN, an eminent surgeon and writer on physiology. The birth and parentage of this gentleman were so obscure, that it is impossible to say with certainty whether he was a native of Ireland or of Scotland. It is even affirmed that he was himself ignorant of the country of his birth. Upon the supposition that he was born in Scotland, his name is introduced in the present work. The date of his birth is given loosely as 1763-64. His parents having brought him in his infancy to London, he commenced his education at a day-school in Lothbury, where he acquired the elements of classical literature. Having afterwards been bound apprentice to Mr. Charles Blick, surgeon to St. Bartholomew's Hospital, he had the advantage of attending that noble institution, where he eagerly seized every opportunity of making himself practically acquainted with his profession. He also had the advantage of attending the lectures of Mr. John Hunter, at the time when that gentleman was commencing the development of those great discoveries which have made his name so famous. The curiosity which those discoveries excited in the public at large, was felt in an uncommon degree by Mr. Abernethy, whose assiduity and ardour as a pupil attracted the notice of the lecturer, and rendered the latter his friend for life.

While as yet a very young practitioner, his reputation procured for Mr. Abernethy the situation of assistant-surgeon at St. Bartholomew's; and he soon after commenced a course of lectures in the hospital, which, though not very successful at first, became in time the most frequented of any in London, so as to lay the foundation of a medical school of the highest reputation in connection with this institution. On the death of Sir Charles Blick, his former master, Mr. Abernethy, now considered as the best teacher of anatomy, physiology, and surgery in the metropolis, was elected surgeon to the hospital.

The first publications of Mr. Abernethy were a few physiological essays, and one on lumbar abscess, which, with some additions, formed his first volume, published 1793-97, in 8vo, under the title of *Surgical and Physiological Essays*. These were characterized by the same strong sense, and plain and forcible illustration, which marked everything that flowed from his tongue and pen till the end of his life. In 1804 appeared another volume, entitled *Surgical Observations, containing a Classification of*

Tumours, with Cases to illustrate the History of each Species; an Account of Diseases, &c.; and, in 1806, *Surgical Observations, Part Second, containing an Account of Disorders of the Health in general, and of the Digestive Organs in particular, which accompany Local Diseases, and obstruct their Cure*. The fame of these treatises soon spread, not only throughout England, but over the continent of Europe; and the French surgeons, especially, did homage to the masterly spirit they evinced. Bold and successful operations, practical and lucid descriptions, original and comprehensive views, all combined to enhance the great reputation of the author, and to elevate the character of the national school of which he was so bright an ornament.

In 1814 Mr. Abernethy received what might be considered as the highest honour which his profession had to bestow, in being appointed anatomical lecturer to the Royal College of Surgeons. An anecdote illustrative of his sound integrity is told in reference to this era of his life. A fellow of the college having remarked to him, that now they should have something new, Mr. Abernethy seriously asked him what he meant. "Why," said the other, "of course you will brush up the lectures which you have been so long delivering at St. Bartholomew's Hospital, and let us have them in an improved form." "Do you take me for a fool or a knave?" rejoined Mr. Abernethy. "I have always given the students at the hospital that to which they are entitled—the best produce of my mind. If I could have made my lectures to them better, I would instantly have made them so. I will give the College of Surgeons precisely the same lectures, down to the smallest details." In the year of this honourable appointment, he published *An Inquiry into the Probability and Rationality of Mr. Hunter's Theory of Life*; being the subject of the two first lectures delivered before the Royal College of Surgeons of London. The aim of these lectures was to elucidate the doctrine previously laid down by Mr. Hunter, that "life, in general, is some principle of activity added by the will of Omnipotence to organized structure, an immaterial soul being superadded, in man, to the structure and vitality which he possesses in common with other animals." Of this work, it is generally allowed that the intentions are better than the philosophy.

Previously to this period, Mr. Abernethy had published other treatises besides those already named. One of the most remarkable was *Surgical Observations on the Constitutional Origin and Treatment of Local Diseases, and on Aneurism*, 8vo, 1809. His memorable cases of tying the iliac artery for aneurism are detailed in this volume; cases which may almost be said to form an era in adventurous surgical experiment. Mr. Abernethy also wrote works on *Diseases resembling Syphilis*, and on *Diseases of the Urethra*; *On Injuries of the Head and Miscellaneous Subjects*; and another volume of *Physiological Essays*. He was likewise the author of the anatomical and physiological articles in Rees' *Cyclopaedia*, previous to the article *Canal*. Among his various accomplishments must be ranked a considerable acquaintance with chemistry; and one of his numerous honours is the having, in company with Mr. Howard, discovered fulminating mercury.

Besides his business as a lecturer, Mr. Abernethy enjoyed a vast and lucrative practice as a surgeon. His manner in both capacities was marked by many eccentricities, but particularly in the latter. He could not endure the tedious and confused narratives which patients are apt to lay before a consulting surgeon,

and, in checking these, was not apt to regard much the rules of good-breeding. Considerable risks were thus encountered for the sake of his advice; but this was generally so excellent, that those who required it were seldom afraid to hazard the slight offence to their feelings with which it was liable to be accompanied. Many anecdotes of Mr. Abernethy's encounters with his patients are preserved in the profession. The two following are given in Sir James Eyre's recent work, *The Stomach and its Difficulties*:—"A very talkative lady, who had wearied the temper of Mr. Abernethy, which was at all times impatient of gabble, was told by him the first moment that he could get a chance of speaking, to be good enough to put out her tongue. 'Now, pray, madam,' said he, playfully, 'keep it out.' The hint was taken. He rarely met with his match, but on one occasion he fairly owned that he had. He was sent for to an innkeeper, who had had a quarrel with his wife, and who had scored his face with her nails, so that the poor man was bleeding and much disfigured. Mr. Abernethy considered this an opportunity not to be lost for admonishing the offender, and said, 'Madam, are you not ashamed of yourself to treat your husband thus; the husband, who is the head of all, *your* head, madam, in fact?' 'Well, doctor,' fiercely retorted the virago, 'and may I not scratch my own head?' Upon this her friendly adviser, after giving directions for the benefit of the patient, turned upon his heel, and confessed himself beaten for once." But abruptness and rudeness were not his only eccentricities. He carried practical benevolence to a pitch as far from the common line as any of his other peculiarities. Where poverty and disease prevented patients from waiting upon him in his own house, he was frequently known, not only to visit them constantly, and at inconvenient distances, without fee or reward, but generously to supply them from his own purse with what their wants required. Perhaps the most striking, out of the numerous anecdotes which have been related of him, in illustration of his eccentricities, is one descriptive of his courtship, or rather of his no-courtship. "While attending a lady for several weeks, he observed those admirable qualifications in her daughter which he truly esteemed to be calculated to make the marriage state happy. Accordingly, on a Saturday, when taking leave of his patient, he addressed her to the following purport:—"You are now so well that I need not see you after Monday next, when I shall come and pay you my farewell visit. But, in the meantime, I wish you and your daughter seriously to consider the proposal I am now about to make. It is abrupt and unceremonious, I am aware; but the excessive occupation of my time by my professional duties affords me no leisure to accomplish what I desire by the more ordinary course of attention and solicitation. My annual receipts amount to £—, and I can settle £— on my wife; my character is generally known to the public, so that you may readily ascertain what it is. I have seen in your daughter a tender and affectionate child, an assiduous and careful nurse, and a gentle and ladylike member of a family; such a person must be all that a husband could covet, and I offer my hand and fortune for her acceptance. On Monday, when I call, I shall expect your determination; for I really have not time for the routine of courtship." In this humour the lady was wooed and won, and the union proved fortunate in every respect. A happier couple never existed."

After a life of great activity, and which proved of much immediate and remote service to mankind, the subject of this memoir expired, at Enfield, on the 20th of April, 1831.

ADAM, ALEXANDER, an eminent grammarian and writer on Roman antiquities, was born at Coats of Burgie, in the parish of Rafford and county of Moray, about the month of June, 1741. His father, John Adam, rented one of those small farms which were formerly so common in the north of Scotland. In his earlier years, like many children of his own class, and even of a class higher removed above poverty, he occasionally tended his father's cattle. Being destined by his parents, poor as they were, for a learned profession, he was kept at the parish school till he was thought fit to come forward as a bursar at the university of Aberdeen. He made this attempt, but failed, and was requested by the judges to go back and study for another year at school. This incident only stimulated him to fresh exertions. He was prevented, however, from renewing his attempt at Aberdeen, by the representations of the Rev. Mr. Watson, a minister at Edinburgh, and a relation of his mother, who induced him to try his fortune in the metropolis. He removed thither early in the year 1758; but, it appears, without any assured means of supporting himself during the progress of his studies. For a considerable time, while attending the classes at the college, the only means of subsistence he enjoyed consisted of the small sum of one guinea per quarter, which he derived from Mr. Alan Macconochie (afterwards Lord Meadowbank), for assisting him in the capacity of a tutor. The details of his system of life at this period, as given by his biographer Mr. Henderson, are painfully interesting. "He lodged in a small room at Restalrig, in the north-eastern suburbs; and for this accommodation he paid fourpence a-week. All his meals, except dinner, uniformly consisted of oatmeal made into porridge, together with small beer, of which he only allowed himself half a bottle at a time. When he wished to dine, he purchased a penny loaf at the nearest baker's shop; and, if the day was fair, he would despatch his meal in a walk to the Meadows or Hope Park, which is adjoining to the southern part of the city; but if the weather was foul, he had recourse to some long and lonely stair, which he would climb, eating his dinner at every step. By this means all expense for cookery was avoided, and he wasted neither coal nor candles; for, when he was chill, he used to run till his blood began to glow, and his evening studies were always prosecuted under the roof of some one or other of his companions." There are many instances, we believe, among Scottish students, of the most rigid self-denial, crowned at length by splendid success; but there is certainly no case known in which the self-denial was so chastened, and the triumph so grand, as that of Dr. Adam. In 1761, when he was exactly twenty, he stood a trial for the situation of head teacher in George Watson's Hospital, Edinburgh, and was successful. In this place he is said to have continued about three years; during which he was anxiously engaged in cultivating an intimacy with the classics—reading, with great care, and in a critical manner, the works of Herodotus, Thucydides, Xenophon, Cicero, and Livy. His views were now directed towards the church, and he was on the eve of being licensed as a preacher of the gospel, when suddenly a prospect opened before him of becoming assistant, with the hope of being eventually the successor, of Mr. Matheson, rector of the high-school. This appointment he obtained, and in 1771 the increased infirmities of Mr. Matheson threw the whole of this charge into the hands of Mr. Adam.

The time when he assumed this respectable office was very fortunate. Every department of knowledge in Scotland was at this period adorned by higher

names than had ever before graced it; and hence the office of master in the principal elementary school of the country presented to a man of superior qualifications a fair opportunity of distinguishing himself. This opportunity was not lost upon Mr. Adam. He devoted himself with singular assiduity to his duties; and under his auspices the school gradually increased in numbers and reputation. Soon after his appointment he began to compose a series of works to facilitate the study of the Latin language. His *Rudiments of Latin and English Grammar* were published in 1772, and though composed in a style which appeared to the generality of teachers as a dreadful schism and heresy, met with the approbation of a discerning few, whose praise was sufficient to overbalance the censure of the multitude. His offence consisted in the novel attempt to teach the grammatical rules of Latin in English prose, instead of Latin prose or verse, which latter had been the time-honoured fashion of the schools both of England and Scotland since the days of the Reformation. The daring innovator was assailed with a storm of abuse by numerous individuals, more especially by those of his own profession.

Among those who took an active part in condemning his work, Dr. Gilbert Stuart was very conspicuous. This extraordinary *litterateur* was a relation of Ruddiman; and, as an additional incentive to his hostility, conceived that Adam had gained the rectorship of the high-school more by interest than by merit. He accordingly filled the periodical works of the day with ridicule and abuse directed against the unfortunate grammar. Amongst other pasquinades appeared an account, in Latin, of a Roman funeral, in which that work was personified as the dead body, while the chief mourner was meant to represent Mr. Adam sorrowing for the untimely fate of his best-beloved child. The other persons officiating are introduced under the technical terms in use among the ancient Romans; and, to heighten the ridicule, and give it aid from local circumstances, the ingenious satirist placed in front of the mourners a poor lunatic of the name of Duff, well known in Edinburgh at the time for his punctual attendance at the head of all funeral processions. While his work was still the subject of censure, the ingenious author was partly compensated for all his sufferings by a degree of LL.D., which was conferred upon him by the College of Edinburgh in 1780. Some years after the grammar began gradually to make its way in schools, and finally he had the satisfaction of seeing it adopted in his own seminary. Among the great names which at an early period had sanctioned it with their approbation are those of Lord Kames, Bishop Lowth, and Dr. Vincent, master of St. Paul's School.

The next work of Dr. Adam is entitled *A Summary of Geography and History* but the date of the first edition is not mentioned by his biographer. In 1791 he published his excellent compendium of *Roman Antiquities*, and in 1800 his *Classical Biography*; for the copyright of the former he received £600, and for that of the latter £300. Dr. Adam's last and perhaps his most laborious work was his *Latin Dictionary*, published in 1805. Towards the beginning his illustrations are brief, but, as he proceeds, they gradually become more copious. It was his intention to add an English-and-Latin part, and to enlarge the other to a considerable extent. In this favourite plan he had made some progress at the time of his death.

On the 13th of December, 1809, Dr. Adam was seized in the high-school with an alarming indisposition, which had all the appearance of apoplexy.

Having been conducted home, he was put to bed, and enjoyed a sound sleep, which appeared to have arrested the progress of the disease, for he was afterwards able to walk about his room. The apoplectic symptoms, however, returned in a few days, and he fell into a state of stupor. His last words marked the gradual darkening of the ray of life and intellect beneath this mortal disorder. He said, "It grows dark, boys—you may go—" his mind evidently wandering at that moment to the scene where he had spent the better part of his life. This twilight soon settled down into the night of death: he expired early in the morning of the 18th December, 1809. The death of the amiable and excellent Dr. Adam operated among his numerous friends and admirers like a shock of electricity. Men of all ages and denominations were loud in lamenting an event which had bereaved them of a common benefactor. The effect of the general feeling was a resolution to honour him with what was at that time a very rare circumstance in Scotland—a public funeral.

The life of Dr. Adam proves, had any proof been wanting, the possibility of rising to distinction in this country from any grade of life, and through whatsoever intervening difficulties. In 1758 and 1759 he was a student living at the inconceivably humble rate of four guineas a year; in ten years thereafter he had qualified himself for, and attained, a situation which, in Scotland, is an object of ambition to men of considerable literary rank. The principal features of his character were, unshaken independence and integrity, ardour in the cause of public liberty, the utmost purity of manners and singleness of heart, and a most indefatigable power of application to the severest studies. "His external appearance was that of a scholar who dressed neatly for his own sake, but who had never incommoded himself with fashion in the cut of his coat or in the regulation of his gait. Upon the street he often appeared in a studious attitude, and in winter always walked with his hands crossed, and thrust into his sleeves. His features were regular and manly, and he was above the middle size. In his well-formed proportions and in his firm regular pace there appeared the marks of habitual temperance. He must have been generally attractive in his early days; and, in his old age, his manners and conversation enhanced the value and interest of every qualification. When he addressed his scholars, when he commended excellence, or when he was seated at his own fireside with a friend on whom he could rely, it was delightful to be near him; and no man could leave his company without declaring that he loved Dr. Adam."

ADAM, ROBERT, an eminent architect, was born at Edinburgh in the year 1728. His father, William Adam, of Maryburgh, in the county of Fife, also distinguished himself as an architect: Hopetoun House and the Royal Infirmary at Edinburgh are specimens of his abilities. Robert, the second son, inherited his father's taste, and lived in a time more favourable to its development. He was educated in the university of Edinburgh, where he enjoyed the kind attentions of Robertson, Smith, and Ferguson, all of whom were his father's friends. As he advanced in life he was on friendly and intimate terms with Archibald, Duke of Argyle, Sir Charles Townshend, and the Earl of Mansfield. About the year 1754, with a view to improve his knowledge of architecture, he travelled on the Continent, and resided three years in Italy, where he surveyed the magnificent specimens of Roman architecture, the buildings of the ancients, in his opinion, being the proper school of the architectural student. But

while he beheld with much pleasure the remains of the public buildings of the Romans, he regretted to perceive that hardly a vestige of their private houses or villas was anywhere to be found. The interest which he felt in this particular branch of Roman remains, and his anxiety to behold a good specimen of the private buildings of this wonderful people, induced him to undertake a voyage to Spalatro, in Dalmatia, to visit and examine the palace of Dioclesian, where, after his resignation of the empire, in 305, that emperor spent the last nine years of his life. He sailed from Venice in 1754, accompanied by two experienced draughtsmen and M. Clerisseau, a French antiquary and artist. On their arrival at Spalatro they found that the palace had not suffered less from dilapidations by the inhabitants, to procure materials for building, than from the injuries of time; and that, in many places, the very foundations of the ancient structures were covered with modern houses. When they began their labours the vigilant jealousy of the government was alarmed, and they were soon interrupted; for, suspecting their object was to view and make plans of the fortifications, the governor issued a peremptory order, commanding them to desist. It was only through the influence and mediation of General Grème, the commander-in-chief of the Venetian forces (probably a Scotsman), that they were at length permitted to resume their labours; and in five weeks they finished plans and views of the remaining fragments, from which they afterwards executed perfect designs of the whole building. Mr. Adam soon after returned to England, and speedily rose to professional eminence. In 1762 he was appointed architect to their majesties, and in the year following he published, in one volume large folio, *Ruins of the Palace of the Emperor Dioclesian at Spalatro, in Dalmatia*. This splendid work contains seventy-one plates, besides letter-press descriptions. He had at this time been elected a member of the Royal and Antiquarian Societies, and in 1768 he was elected to represent Kinross-shire in parliament, which was probably owing to the local influence of his family. A seat in the House of Commons being incompatible with employment under the crown, he now resigned his office as architect to their majesties; but continued to prosecute his professional career with increasing reputation, being much employed by the English nobility and gentry in constructing new and embellishing ancient mansions. In the year 1773, in conjunction with his brother, James Adam, who also rose to considerable reputation as an architect, he commenced *The Works in Architecture of R. and J. Adam*, which before 1776 had reached a fourth number, and was a work of equal splendour with the one above referred to. The four numbers contain, among other productions, Sion House, Caen Wood, Luton Park House, the Gateway of the Admiralty, and the General Register House at Edinburgh; all of which have been admired for elegant design and correct taste, though the present age, in its rage for a severe simplicity, might desire the absence of certain minute ornaments with which the Adams were accustomed to fill up vacant spaces. Before this period the two brothers had reared in London that splendid monument of their taste—the Adelphi, which, however, was too extensive a speculation to be profitable. They were obliged in 1774 to obtain an act of parliament to dispose of the houses by way of lottery. The chief Scottish designs of Adam, besides the Register Office, were the new additions to the University of Edinburgh and the Infirmary of Glasgow. "We have also seen and admired," says a biographer, "elegant designs executed by Mr. Adam, which were intended

for the South Bridge and South Bridge Street of Edinburgh; and which, if they had been adopted, would have added much to the decoration of that part of the town. But they were considered unsuitable to the taste or economy of the times, and were therefore rejected. Strange incongruities," continues the same writer, "appear in some buildings which have been erected from designs by Mr. Adam. But of these it must be observed, that they have been altered or mutilated in execution, according to the convenience or taste of the owner; and it is well known that a slight deviation changes the character and mars the effect of the general design. A lady of rank was furnished by Mr. Adam with the design of a house; but on examining the building after it was erected, he was astonished to find it out of all proportion. On inquiring the cause he was informed that the pediment he had designed was too small to admit a piece of new sculpture which represented the arms of the family, and, by the date which it bore, incontestably proved its antiquity. It was therefore absolutely necessary to enlarge the dimensions of the pediment to receive this ancient badge of family honour, and sacrifice the beauty and proportion of the whole building. We have seen a large public building which was also designed by Mr. Adam; but when it was erected the length was curtailed of the space of two windows, while the other parts remained according to the original plan. It now appears a heavy unsightly pile, instead of exhibiting that elegance of proportion and correctness of style which the faithful execution of Mr. Adam's design would have probably given it. To the last period of his life Mr. Adam displayed the same vigour of genius and refinement of taste; for in the space of one year immediately preceding his death he designed eight great public works, besides twenty-five private buildings, so various in style, and beautiful in composition, that they have been allowed by the best judges to be sufficient of themselves to establish his fame as an unrivalled artist." Mr. Adam died on the 3d of March, 1792, by the bursting of a blood-vessel, in the sixty-fourth year of his age, and was buried in Westminster Abbey. It remains only to be said that, while his works commanded the admiration of the public, his natural suavity of manners, joined to his excellent moral character, had made a deep impression upon the circle of his own private friends. His brother James, who has been referred to as associated with him in many of his works, died October 20, 1794.

ADAMSON, HENRY, a poet of the seventeenth century, and probably a relative of the subject of the following article, was the son of James Adamson, who was dean of guild in Perth, anno 1600, when the Gowrie conspiracy took place in that city. The poet was educated for the pulpit, and appears to have made considerable progress in classical studies, as he wrote Latin poetry above mediocrity. He enjoyed the friendship and esteem of a large circle of the eminent men of that age, particularly Drummond of Hawthornden, who induced him, in 1638, to publish a poem entitled *Mirthful Musings for the Death of Mr. Gall*; being in fact a versified history of his native town, full of quaint allegorical allusions suitable to the taste of that age. A new edition of this curious poem, which had become exceedingly rare, was published in 1774, with illustrative notes by Mr. James Cant. The ingenious author died in 1639, the year after the publication of his poem.

ADAMSON, PATRICK, Archbishop of St. Andrews. This prelate, whose name occupies so

remarkable a place in the history of the Scottish reformation, was born of humble parents, in the town of Perth, in or nigh the year 1543. He studied at the university of St. Andrews, and, after having gone through the usual course, he graduated as Master of Arts. His name at this period was Patrick Consteane, or Constance, or Constantine, for in all these forms it is written indifferently; but how it afterwards passed into Adamson we have no means of ascertaining. At the close of his career at college, he opened a school in Fife, and soon obtained the notice and patronage of James M'Gill of Rankeillor, one of the judges of the Court of Session, who possessed considerable political influence. He had not long been minister of Ceres, to which he had been appointed, when we find him impatient to quit his charge; and accordingly, in 1564, he applied to the General Assembly for leave "to pass to other countries for a time, to acquire increase of knowledge," but was inhibited to leave his charge without the Assembly's license. That license, however, he seems at length to have obtained, and probably also before the meeting of the Assembly in the following year, when they published such stringent decisions against those ministers who abandon their spiritual charges. Patrick Constance, or, as we shall henceforth call him, Adamson, now appointed tutor of the son of M'Gill of Rankeillor, passed over with his young charge, who was destined for the study of the civil law, to Paris, at that time the chief school of the distinguished jurisconsults of Europe.

Adamson had not been long in Paris when such adventures befell him as might well make him sigh for the lowly obscurity of Ceres. In the course of events that had occurred in Scotland during his absence, were the marriage of Queen Mary and Henry Darnley, and the birth of their infant, afterwards James VI.; and Adamson, who at this time was more of a courtier than a politician, and more of a poet than either, immediately composed a triumphant "carmen" on the event, entitled, *Serenissimi et nobilissimi Scotie, Anglia, Francia, et Hibernia Principis, Henrici Stuarti Illustrissimi Herois, ac Mariae Reginae amplissimæ Filii, Genethliacum*. The very title was a startling one, both to France and England, the great political questions of which countries it at once prejudged, by giving them the Scottish queen for their lawful, indisputable sovereign. Had this poem, which was published a few days after the event, been produced in England, its author would scarcely have escaped the Star Chamber; but as it was, he was within the reach of Catherine de Medicis, to the full as jealous of her authority as Elizabeth herself. Adamson was therefore rewarded for his Latin poetry by a six months' imprisonment, which perhaps would have been succeeded by a worse infliction, had it not been for the mediation of Mary herself, backed by that of some of her chief nobles. It did not at that time suit the policy of France to break with Scotland, and the poet was set at liberty. Having thus had a sufficient sojourn in Paris, Adamson repaired with his pupil to Bourges, where both entered themselves as students of law. Even here, however, he was not long allowed to remain in safety. The massacre of St. Bartholomew—that foul national blot of France, and anomaly of modern history—burst out with the suddenness of a tornado, and, amidst the ruin that followed, no Protestant could be assured of his life for a single hour. Adamson had his full share of the danger, and narrowly escaped by finding shelter in a lowly hostelry, the master of which was after-

wards flung from the top of his own house, and killed on the pavement below, for having given shelter to heretics. While immured in this dreary confinement for seven months, and which he fitly termed his sepulchre, Adamson consoled himself with Latin poetry upon themes suited to his condition; one attempt of this nature being the tragedy of Herod, and the other a version of the book of Job. As soon as he was able to emerge, one of the first uses which he made of his liberty was to return home and resume those ministerial labours which he had good cause to regret he ever had abandoned.

This return was at a critical period; for the archbishopric of St. Andrews was at that time vacant, and, notwithstanding the Presbyterian doctrine of parity, which had been laid down as a fundamental principle of the Scottish church, the chief prelate offices were still continued, through the overbearing influence of those nobles who now directed the government. But it was from no love of Episcopacy in the abstract that these magnates continued such charges, obnoxious though they were to the church and the people at large, but that they might derive from them a profitable revenue as lay proprietors of the livings. In this way the Earl of Morton had acquired a claim to the revenues of the archbishopric of St. Andrews, and only needed some ecclesiastic who could wear the title, and discharge its duties, for a small percentage of the benefice. It was a degrading position for a churchman, and yet there were too many willing to occupy it, either from love of the empty name, or an ambitious hope of converting it into a substantial reality. Among these aspirants for the primacy of Scotland, Patrick Adamson was suspected to be one; and it was thought that he hoped to succeed through the influence of his patron, M'Gill of Rankeillor. These surmises his subsequent conduct too well justified. But Morton had already made his election in favour of John Douglas, who was inducted into the office, notwithstanding the earnest remonstrances of John Knox. The conduct of Adamson on this occasion was long after remembered. The week after the induction, and when the greatest concourse of people was expected, he ascended the pulpit and delivered a vehement and sarcastic sermon against the episcopal office as then exercised in Scotland. "There are three sorts of bishops," he said; "my lord bishop, my lord's bishop, and the Lord's bishop. My lord bishop was in the Papistry; my lord's bishop is now, when my lord gets the benefice and the bishop serves for nothing but to make his title sure; and the Lord's bishop is the true minister of the gospel." He saw that, for the present at least, he could not be primate of St. Andrews, and therefore turned his attention to the more humble offices of the church. And there, indeed, whatever could satisfy the wishes of a simple presbyter was within his reach; for he was not only in general esteem among his brethren, but highly and justly valued for his scholarship, and his catholicism of Calvin in Latin heroic verse, which he had written in France, and was about to publish in Scotland with the approbation of the General Assembly. He now announced his willingness to resume the duties of the ministry; and the town of Paisley became his sphere of duty, according to the appointment of the Assembly. In addition to this, he was subsequently appointed commissioner of Galloway, an office which resembled that of a bishop as to its duties, but divested of all its pre-eminence and emolument. Some of the best men of the kirk had undertaken this thankless office with alacrity,

and discharged its duties with diligence, but such was not the case with Patrick Adamson; and when his remissness as a commissioner was complained of to the General Assembly, he acknowledged the justice of the accusation, but pleaded in excuse that no stipend was attached to the office.

Of the labours of Adamson while minister of Paisley no record has been preserved. His time there, however, was brief, as a new sphere was opened to his ambition. The great subject of anxiety at this period in the church was the construction of the *Book of Policy*, otherwise called the *Second Book of Discipline*, and procuring its ratification by the government; but the chief obstacle in the way was the Earl of Morton, now regent, whose principal aim, besides enriching himself with the ecclesiastical revenues, was to bring the two churches of England and Scotland into as close a conformity as possible, in order to facilitate the future union of the two kingdoms under the reign of his young master, James VI. Here it is that we find Adamson busy. He became an active negotiator for the *Book of Policy*, and while he managed to secure the confidence of the leading men in the church, he ingratiated himself into the favour of the regent; so that when the latter chose him for his chaplain, the brethren seem to have hoped that the accomplishment of their purpose would be facilitated by having such an advocate at court. But never were ecclesiastics more thoroughly disappointed in their hopes from such a quarter. The archbishopric of St. Andrews had again become vacant, and Morton nominated Adamson to the see, who, on receiving the appointment, began even already to show that he would hold it independently of the authority of the church by refusing to submit to the usual trial and examination of the Assembly. While chaplain to the regent, he had been wont, while preaching and giving his glosses upon texts of Scripture, to say, "The prophet would mean this"—a phrase so usual with him on such occasions that his hearers could not help noticing it. At length, when he became primate of Scotland, Captain Montgomery, one of the regent's officers, exclaimed, with dry humour, "I never knew what the prophet meant till now!" As Adamson's entering into the archbishopric was such an act of contravention to the authority of the church, the Assembly, at one of its meetings in 1577, resolved to institute proceedings against the offender. But even this formidable danger he was able to avert for the time with his wonted craft. He professed the utmost humility, and offered to lay down his office at the feet of the Assembly, and be ordered at their pleasure, but represented how desirable it would be to postpone all such proceedings until the *Book of Policy* had been finished, and ratified by the regent. The matter was thus reduced to a mere question of time, and his suggestion prevailed.

The great subject now at issue was the *Book of Ecclesiastical Policy*—the Magna Charta of the Church of Scotland—upon the passing of which its rights and liberties as a national church were at stake. It was, as might have been expected, completely presbyterian in its discipline, and subversive of that episcopal rule which the court was labouring to establish. Among these enactments it was decreed that no bishop should be designated by his title, but his own name, as a brother, seeing he belonged to a church that has but one Lord, even Christ—that no bishops should thenceforth be appointed in it; and that no minister should accept the office on pain of deprivation. Against such conclusions it is not wonderful that Adamson demurred. But as himself and the Bishop of Aberdeen constituted the entire

minority in the Assembly, his opposition went no further than to procrastinate any final conclusion. But the *Policy* was at length concluded, and ready to be presented to the government, and for this Adamson had reserved his master-stroke. The book was to be subscribed by every member individually, but this form the archbishop opposed. "Nay," he said, "we have an honest man, our clerk, to subscribe for all; and it would derogate from his faithfulness and estimation if we should all severally subscribe." The brethren assented to the proposal, although some of them seem to have entertained a lurking suspicion that all was not right; so that Mr. Andrew Hay, minister of Renfrew, could not help exclaiming, "Well, if any man comes against this, or denies it hereafter, he is not honest." He stepped up to Adamson, and said to him in the presence of three or four by-standers, "There is my hand, Mr. Patrick; if you come against this hereafter, consenting now so thoroughly to it, I will call you a knave, were it never so publicly." The *Book of Policy* was to be presented to the Lords of Articles for ratification on the part of the government; and strangely enough, Adamson was commissioned to present it. Morton and the lords asked him if he had given his assent to these enactments, to which he answered that he had not, and that he had refused to subscribe to them. Here was a loophole of escape for the council: the Archbishop of St. Andrews had withheld his assent, and they could do no less than follow the example. The book was rejected, and the ministers were left to divine the cause of the refusal. But Andrew Hay, on inquiring of several members of council, who told him the particulars, and laid the whole blame of the refusal on Adamson, soon saw that he had a pledge to redeem; and on the archbishop passing by at that instant, he gripped him by the hand, looked him angrily in the face, and exclaimed, in presence of the others, "O knave, knave, I will crown thee the knave of all knaves!" It is enough to add here, that the *Book of Policy*, after having been delayed three years longer, was in 1581 thoroughly ratified and ordained in every point, and ordered to be registered in the books of the Assembly. As for Adamson, we find him employed during this interval in preaching in St. Andrews, lecturing in the college, and attending the meetings of the General Assembly, but with no greater authority than that of the ordinary brethren. But symptoms even already had shown that the court favour upon which he was willing to build was but a sandy foundation, for his powerful patron, the Earl of Morton, had been brought to the block. He prepared himself, therefore, to recognize the authority of the kirk in the doctrine of bishops, to which he had been opposed, and even gave his subscription to the articles of the *Book of Policy*, which he had hitherto withheld. This was in St. Andrews, before the celebrated Andrew Melville and a party of his friends who were assembled with him. But all this was insufficient: he must also secure the favour of the party in power, whatever for the time it might be; and for this purpose he passed over to Edinburgh, and took his seat in the Convention of Estates. Here, however, his reception was so little to his liking, that he found he must side wholly with the kirk. He therefore addressed himself to the ministers of Edinburgh with professions which his subsequent conduct showed to be downright hypocrisy. He told them that he had come over to the court in the spirit of Balaam, on purpose to curse the kirk and do evil; but that God had so wrought with him, that his heart was wholly changed, so that he had advocated and voted in the church's behalf—

and that henceforth he would show further and further fruits of his conversion and good meaning. This self-abasing comparison of himself to Balaam must have staggered the unfavourable suspicions of the most sceptical; at all events, it did so with the apostolic John Durie, who rejoiced over the primate's conversion, and wrote a flattering account of it to James Melville. The latter, in consequence, visited Adamson upon his return, and told him the tidings he had received, for which he heartily thanked God, and offered the archbishop the right hand of Christian fellowship. The other, still continuing his penitent grimace, described the change that had passed upon him at great length, which he attributed to the working of the Spirit within him. Perhaps he overacted his part, for Melville only observed in reply, "Well, that Spirit is an upright, holy, and constant Spirit, and will more and more manifest itself in effects; but it is a fearful thing to lie against him!"

It was indeed full time for the Archbishop of St. Andrews not only to recover his lost credit with the kirk, but the community at large. He was generally accused of the vices of intemperance and gluttony; he was noted as an unfaithful paymaster, so that he stood upon the score of most of the shopkeepers in the town; and what was still worse, he was accused of consorting with witches, and availing himself of their unlawful power! We of the nineteenth century can laugh at such a charge, and imagine it sufficient not only to disprove itself, but weaken all the other charges brought against him. But in the sixteenth century it was no such laughing matter; for there were not only silly women in abundance to proclaim themselves witches, but wise men to believe them. Even the pulpits of England as well as Scotland resounded with sermons against witchcraft; and the learned and wise Bishop Jewel, while preaching before Elizabeth, assured her majesty that the many people who were dying daily, in spite of all the aid of leechcraft, were thus brought to their end by spells and incantations. While this was the prevalent belief, a person having recourse to such agency was wilfully and deliberately seeking help from the devil, and seeking it where he thought it could best be found. Now Adamson, among his other offences, had fallen into this predicament. He was afflicted with a painful disease, which he called a "fedyty;" and being unable to obtain relief from the regular practitioners, he had recourse to the witches of Fife, and among others, to a notable woman, who pretended to have learned the art of healing from a physician who had appeared to her after he was dead and buried! This wretched creature, on being apprehended and convicted of sorcery, or what she meant to be such, was sentenced to suffer death, as she would have been in any other country of Europe, and was given in charge to the archbishop for execution. But the woman made her escape, and this, it was supposed, she did through Adamson's connivance. After this statement, it needs scarcely be wondered at that foremost in the accusations both from the pulpit and in church-courts, the crime of seeking aid from Satan should have been specially urged against him. The man who will attempt "to call spirits from the vasty deep," incurs the guilt of sorcery whether they come or not.

While such was the evil plight to which the archbishop was reduced, and out of which he was trying to struggle as he best could, the condition of public affairs was scarcely more promising for his interests. In the Assembly held in April, 1582, he had seen Robert Montgomery, Archbishop of Glasgow, who was his constant ally in every episcopal movement, arraigned at their bar, reduced to the most humbling

confessions, and dismissed with the fear of deposition hanging over him. In the same year, the Raid of Ruthven had occurred, by which the royal power was coerced, and presbytery established in greater authority than ever. Dismayed by these ominous symptoms, Adamson withdrew from public notice to his castle of St. Andrews, where he kept himself "like a toad in his hole," giving out that his painful "fedyty" was the cause of his retirement. But at length the sky began to brighten, and the primate to venture forth after a whole year of concealment. The king emancipated himself from his nobles of the Raid, and came to St. Andrews, upon which the archbishop, flinging off his sickness like a worn-out cloak, resumed his abandoned pulpit with royalty for an auditor, and preached such sermons as were well fitted to ingratiate himself into the favour of the young sovereign. They were furious declamations against the lords of the Raid, against the ministers of the kirk by whom they had been countenanced, and against all their proceedings by which the headlong will of James had been reduced within wholesome limits; and these, too, were delivered in such fashion, as, we are informed by James Melville, "that he who often professed from the pulpit before that he had not the spirit of application, got the gift of application by inspiration of such a spirit as never spoke in the Scriptures of God." Among the other effects of the Raid of Ruthven, was the banishment of the king's unworthy favourites, the Earl of Arran and the Duke of Lennox, the former from the royal presence, and the latter from the country; and Lennox took his exile so much to heart, that he died soon after he arrived in France, while James continued to bewail his loss. Here, then, was a favourable theme for the archbishop. The chief offence alleged against Lennox was, that though outwardly a Protestant, he had not only lived, but even died, a Papist; and from this stigma it was Adamson's main effort to clear the memory of the departed. He therefore boldly asserted, in his sermon, that Lennox had died a good Protestant, and in proof of this he exhibited in the pulpit a scroll, which he called the duke's testament. It happened unluckily for the preacher, however, that an honest merchant woman, who sat near the pulpit, looked narrowly at this important document, and saw with astonishment that it was an account of her own, which she had sent to the archbishop for a debt of some four or five years' standing, but which, like other reckonings of the kind, he had left unpaid!

Adamson's loyalty was soon rewarded, and in a way that best accorded with his wishes. He was to be employed as ambassador or envoy from the king to the court of London. What was the ostensible object of his mission does not appear; but its real purport was, the suppression of Presbyterianism in Scotland, and the establishment of such a form of Episcopacy in its stead as might make the union of the two countries more complete, when James should become king of both. But in such an office the messenger behaved to go warily to work, as Elizabeth was apt to take fire at every movement that pointed to a succession in her throne. Another serious difficulty interposed in the very threshold of the archbishop's departure. He had already been charged before the presbytery of St. Andrews, as corrupt both in life and doctrine: the trial was removed to the synod, and was finally remitted to the General Assembly, at whose bar he must justify himself, or be deposed for non-appearance; and he thus felt himself between the horns of a dilemma in which his comparance or absence might be equally fatal. If, however, he could only get the trial delayed until

he had accomplished his mission, he might then brave it, or quash it with impunity. He therefore called sickness to his aid, and pretended that he was going to the wells of Spa, in Germany, for the recovery of his health; and this was nothing more than reasonable, even though he should take London by the way. Forth therefore he went, unhindered and unsuspected; and, if there is any truth in *The Legend of the Lymmar's Life*, a satirical poem written by Robert Semple, the archbishop's conduct during this embassy was anything but creditable to his employers. His chief aim, indeed, seems to have been to replenish his extenuated purse; and, provided this was accomplished, he was not scrupulous about the means. Even horses, books, and gowns came into his permanent possession under the name of loans. His approach to the palace for his first, and, as it turned out, his last audience, was equally unseemly, for he used the hallowed wall of the palace of the virgin queen with as little fastidiousness as if it had been the dingy habitation of some Scottish baron in one of the closes of the Canonigate, so that a porter, who espied him from the gate, rushed out and rebuked his indecorum with a cudgel. But, amidst all his Scapin-like tricks in the English metropolis, from which he seems to have derived for the time a comfortable revenue, Adamson was not unmindful of the real object of his journey, which he pursued with a diligence worthy of a better cause. He endeavoured to enlist the prejudices of the queen against the ministers of Scotland, and such of the nobility as favoured them; he consulted with the bishops upon the best means of conforming the Scottish to the English church; and, aware of the purpose of his own court to banish or silence the best of the clergy, he wished them to send learned and able ministers to supply the pulpits of those who were to be displaced. But, not content with this, he endeavoured to bring the Kirk of Scotland into discredit with the foreign reformed churches of France, Geneva, and Zurich, by sending to them a list of garbled or distorted passages as propositions extracted from the Scottish Confession, and craving their opinion as to their soundness. It was a crafty device, and might have been attended with much mischief, had it not been that an antidote to the bane was at this time in England, in the person of Mr. Andrew Melville, a more accomplished scholar, as well as a more able and eloquent writer, than Adamson himself. He drew up a true statement of the subjects propounded, and sent them to the foreign churches, by which the archbishop's design was frustrated. But the work of mere ecclesiastical diplomacy does not seem to have been sufficient for the restless Adamson, so that he was suspected of intriguing with the French and Spanish ambassadors, and connecting himself with the plot of Throckmorton, the object of which was the liberation of Mary and the restoration of Popery. It was a strange period of plots and conspiracies, where Protestant, Papist, and Puritan, priest and layman, foreigner and Englishman, were often mingled together as in a seething and bubbling cauldron, for the concoction of a charm by which a cure for every public evil was to be effected. It was immediately on the detection of this Throckmorton conspiracy, and the apprehension of its author, that the archbishop secretly withdrew from England and returned home, after having been employed fully six months in these and other such devices in London.

While Adamson had thus been occupied in England, the government at home had not been idle; and the worthless Earl of Arran, who, since the suppression of the Raid of Ruthven, had recovered

the royal favour, proceeded to put his plan in execution of silencing, imprisoning, and banishing the best and most distinguished of the Scottish clergy. It was thus that the flocks were to be brought to helplessness, and a new order of shepherds introduced. The list of the persecuted was a large one; but among the most illustrious of these were some of the most distinguished lights of the Scottish reformation, such as Andrew Melville, John Davidson, Walter Balcanquhal, and James Lawson. Of these we can only particularize the last, as his closing scene was but too intimately connected with the history of Patrick Adamson. Lawson had been the friend and fellow-labourer of Knox, whom he succeeded as minister of Edinburgh; and in this important charge, while he was closely connected with all the principal ecclesiastical movements of the period, he was distinguished by his gentleness, self-denial, and piety. But these were the very qualities that now marked him out as a victim; and the imperious Arran did not hesitate to threaten that, though his head were as big as a haystack, he would make it fly from his shoulders. Lawson knew that his life was aimed at, and, like several of his brethren thus circumstanced, he fled to England, and took up his residence at London, in one of the lanes leading from Cheapside. But the uncongenial climate, and, above all, the defection of many of his flock during his absence, so heavily afflicted him, that he fell into a disease, of which he died in little more than a month. Upon his death-bed, the English who visited him were edified with his pious remarks, which they carefully treasured up for their families and acquaintances; and his last prayers were for mercy in behalf of those who would neither enter the kingdom of God themselves, nor suffer others to enter therein. And will it be believed that Patrick Adamson, the man for whom in especial he had so prayed, conceived the idea of perverting such a death-bed to his own political purposes? But so it was. He sat down with the pen of a ready writer, and composed an elaborate testament in Lawson's name, in which the dying man was made to abjure all his Presbyterian principles, to grieve over them as deadly sins, to recommend the government of the church by bishops, and enjoin implicit obedience to the king's authority. It was indeed a bold exploit in literary forgery; but, at this period and afterwards, when the pen outran the activity of the press, and communities were so separated, it was easy to make a fraud of this kind, where the locality was transferred to London, to pass current in the streets of Edinburgh. There is no doubt that thus the archbishop had calculated; but, like many very cunning people, he in this instance betrayed himself by his over-scrupulous dexterity. Thus, not content with making Lawson recant all the principles of his well-spent life with a hurry that was inconceivable, and laud episcopal rule with an unctious and earnestness which the Archbishop of Canterbury himself could not have surpassed, he also made him, in exhorting his old co-presbyters, to vent a malignity of sentiment, and drolling bitterness of satire, such as, whether living or dying, Lawson could not and would not have used. But it fortunately happened that proof still stronger than inferential evidence was at hand, to convict this impudent forgery; for Lawson himself had written his last testament, which was witnessed with the honoured names of Andrew Melville, James Carnichael, John Davidson, and Walter Balcanquhal.

After his return from England, Adamson did not lie idle; he zealously joined the king and Arran in their persecution of the best adherents of the kirk, under which, not only the principal ministers, but

also the chief of the nobility, were fugitives in England. His pen also was soon in requisition for a more dignified work, at least, than that of blackening the memory of a departed brother; it was to advocate, defend, and justify certain obnoxious measures of James and his favourite, that had passed through the parliament in 1584, and were generally unpopular, both on account of their anti-presbyterian spirit in religion and their despotic tendencies in civil rule. This task Adamson accomplished, and with such plausibility and ingenuity, that his apology was not only in high favour with the king, but widely popular in England, so that it was inserted in the appendix of Holinshed's *History* as a true picture of the religious state of Scotland. But this was not his only reward. Although he was still a suspended presbyter, with his trial by the General Assembly hanging over him, and accounted a very Julian the Apostate by his former brethren, yet he was now to be confirmed in his primacy, with all the high rights and immunities that could be comprised within the office. This was announced by a royal letter, under the great seal, and, as such, was indignantly termed by the ministers the King's bull, "giving and granting to his well-beloved clerk and orator, Patrick, Archbishop of St. Andrews, power, authority, and jurisdiction to exercise the same archbishopric by himself, his commissioners, and deputies, in all matters ecclesiastical, within the diocese of St. Andrews, and sheriffdoms which have been heretofore annexed thereto." In this way he would be able to sit as presiding moderator in that Assembly where he should have stood as a culprit, and to silence the charges which he could not answer. But this, his culminating point, was also that of his downfall. The banished lords, who had withdrawn themselves to England, now took counsel upon the oppressed state of their country, and resolved to redress it after the old Scottish fashion. They therefore approached the border, where they could communicate with their allies, and appoint musters of their retainers; and at length, all being in readiness, Angus, Mar, Glamis, and the Hamiltons entered Scotland, and rapidly marched to Stirling, at the head of eight thousand armed men, to reason with their misguided sovereign. He soon found himself, like many of his ancestors, the pupil of force and necessity, and was compelled to yield to their stern remonstrances; while Arran was again, and for the last time, banished into that obscurity from which he should never have been summoned.

The return of the exiled lords, and the banishment of Arran from court, produced a breathing interval to the kirk; and the ministers who had been dispersed, warded, or silenced, were restored to liberty and their charges. It was now time, therefore, to redress the evils that had been inflicted upon the church, and these too by members of its own body, during the last two years of trial, if its polity and discipline were to be something more than a name. It was a stern duty, as Adamson was soon to feel. He had laboured for the eversion of the kirk, and the persecution of its ministers, under an unconstitutional authority against which he had protested and subscribed; and for all this he must answer before the court to which the assize of such delinquencies pertained. The synod of St. Andrews, which had been closed during the persecution, was to be reopened; and their first work was to be the trial of their own archbishop, whom their laws recognized as a simple presbyter, and nothing more. This solemn meeting was therefore convoked in April, 1586, to which a great concourse assembled; and thither also came the archbishop, "with a great

pontificality and big countenance," for he boasted that he was in his own city, and possessed of the king's favour, and therefore needed to fear no one. He also placed himself close by the preacher, who was Mr. James Melville, as if determined to outrave the whole assembly. The discourse was a vindication of the polity of the church, and a rehearsal of the wrongs it had suffered; and then, "coming in particular," says Melville himself, "to our own Kirk of Scotland, I turned to the bishop, sitting at my elbow, and directing my speech to him personally, I recounted to him, shortly, his life, actions, and proceedings against the kirk, taking the assembly there to witness, and his own conscience before God, if he was not an evident proof and example of that doctrine; whom, being a minister of the kirk, the dragon had so stung with the poison and venom of avarice and ambition, that, swelling exorbitantly out of measure, threatened the wreck and destruction of the whole body, unless he were timeously and with courage cut off." To this formidable appeal the archbishop endeavoured to answer, but it was only with frivolous objections and threats of the king's displeasure, while his courage was so utterly gone that he could scarcely sit, far less stand on his feet. But the business commenced, the process was entered into, and Adamson left the meeting. He was invited to return, but he sent for answer that the synod was no judge to him, but he to it. He not only persisted in refusing to appear, but sent such answers to the charges against him as only aggravated the offence. Nothing remained but to inflict upon him the final sentence of the church, which was done accordingly.

The doom so long suspended had thus fallen at last; but still the primate would not yield. He rallied himself for a desperate counter-movement, and penned, by his own sole authority, a sentence of excommunication against the two Melvilles and some of his principal accusers in the synod, which he sent by a boy, accompanied by two of his jackmen; but when this most informal missive was read in the church, the audience were as little moved as if he had excommunicated the stones of the building. He also sent a complaint against these proceedings to the king, with an appeal from the authority of the synod, to his majesty, the estates, and the privy council. On the arrival of Sabbath, he prepared for a decisive effort, by preaching in the church in spite of the sentence. But just when he was about to ascend the pulpit, a mischievous rumour reached his ear, that several gentlemen and citizens had assembled in the new college, to take him out of the pulpit, and hang him; and, terrified at the report, he not only called his friends and jackmen to the rescue, but fled from the church, and took refuge in the steeple. And yet the whole cause of the stir was nothing more than the assembling of a few gentlemen and citizens in the new college, to attend the preaching of Andrew Melville, instead of that of an excommunicated man! The archbishop's friends followed him to the steeple, to assure him of his safety; but so desperate was his fear, that they could scarcely drag him out by force. While he was half-led, half-carried down the High Street, and through the north gate towards his castle, an unlucky stray hare, terrified at the coming din, suddenly started up, and fled before them. Even this incident could impart some gravity to the scene. It was a popular belief at that time in Scotland that a witch, when pursued, usually assumed the form of a hare, more effectually to insure her escape; and the appearance of the poor animal at such a time and place made the people declare that it was no other than the

prelate's witch, abandoning her master, to make good her own safety.

We have already stated that Adamson appealed against the sentence of excommunication, to the authority of the king. In this singular appeal, he declaimed with great learning and marvellous plausibility about the right of royalty to interpose against ecclesiastical as well as civil tyranny; and as he had already made out, as he thought, his own case to be one of undue ecclesiastical oppression on the part of his enemies, the conclusion was plain, that the king could lawfully release him from the spiritual sentence. He wound up his reasoning with the following supposition, to which, he well knew, James would not be insensible: "Beseeching your majesty to consider and weigh with your highness' self, nobility, and council, how dangerous a thing it is to put such a sword in such men's hands, or to suffer them to usurp further than their duty; whereby it may come to pass, that as rashly and unorderly they have prettendly excommunicated the first man of your majesty's parliament (albeit unworthy), so there rests nothing of their next attempt to do the same to your majesty's self." The king's pride was roused at such a thought, and he arrogantly required the ministers to rescind their sentence, threatening them with the deprivation of their rights and stipends in the event of a refusal. The General Assembly met in May the same year, when these conditions were proposed, and the members were in sore strait how to act, for most of the restored lords, after being replaced in their possessions, had left the church to shift for itself. At length a medium course was adopted by the Assembly, and that, too, only by a small majority. It was, that the archbishop "should be holden and repute in the same case and condition that he was in before the holding of the synod of St. Andrews, without prejudice, decerning, or judging anything of the proceedings, process, or sentence of the same synod." It was a strange decision, by which Adamson was allowed to teach, preach, and exercise his clerical functions, excommunicated though he still was; while the pulpits, by royal decree, were not only to be patent to his entrance, but the students of St. Andrews were commanded to attend his lectures in the old college as heretofore. This violence, as might be expected, produced counter-violence, so that libels were thrown not only into the archbishop's chamber, but the pulpits in which he officiated, threatening him with death for his intrusion. And as if all this had not been enough, he added to his further disqualifications, by inability to pay his debts, in consequence of which he was, according to the practice of the Scottish law, denounced a rebel, and put to the horn. This case was brought before the Assembly of June, 1587, because many people had demurred to attend his ministrations while he laboured under such degrading disabilities. The Assembly, however, decided that these were of a civil rather than an ecclesiastical character, and referred them to the king for adjustment.

In the very same year and month, while Adamson was in this miserable plight—an excommunicated minister and an outlawed prelate—the first man in the parliament, and yet a denounced rebel because he could not pay his debts—a gleam of royal sunshine fell upon him, which was destined to be the last. The celebrated Du Bartes visited Scotland, and James was desirous that the learned poet should see the two most accomplished scholars in Scotland—Andrew Melville and Patrick Adamson. To St. Andrews, accordingly, the royal *cortege* repaired; and the first notice which Melville had of the visit was

from the king himself, who bluntly told him that he had come with the illustrious foreigner, to have a lesson from him in his class-room. Melville would have excused himself, on the plea that he had already delivered his ordinary lecture in the forenoon. "That is all one," said the king; "I *must* have a lesson, and be you here within an hour for that effect." In less than an hour the professor was in readiness, and commenced such a lecture, as made the king wish himself once more among the deer in Falkland. It was an eloquent extemporaneous oration, in which he vindicated Christ's right of sovereignty over his own church, and refuted and exposed the acts of parliament that had been lately enacted subversive of the kirk's authority. James went home in no very pleasant mood, and remained in a fume the whole evening. On the next morning it was Adamson's turn, who was not likely to trespass in the same fashion. During the interval, he had prepared a "tightened-up abridgment" of his previous year's lectures, in which he attempted to vindicate the royal supremacy in ecclesiastical affairs, and justify the steps that had been taken for that purpose. Andrew Melville, who attended as an auditor, took notes of the archbishop's arguments; and without further study, caused the college bell to be rung after a short interval, to announce a new lecture. The king, who had not yet digested the lesson of yesterday, sent a warning to Melville to be moderate, otherwise he would discharge him; to which the other replied, that his majesty's ear had already been abused by Adamson's errors and untruths, which he could not allow to pass unquestioned, unless his breath were stopped by death itself—but that still, he should be careful to behave himself most moderately and reverently to his majesty in all respects. The king was satisfied with this assurance, and repaired to the class-room, where Adamson was also in attendance; and he craved and obtained the royal permission to reply, should anything be alleged against his doctrine. The two strong champions were now standing front to front in the lists—and never had king of Scotland so delighted in the hurling together of man and horse, and the shivering of spears, as did James in the prospect of an intellectual tournament, where dexterous syllogisms and home-thrust arguments were the only blows in circulation. But here Melville changed his tactics, in a way that would have puzzled the most experienced master of fence. He had no longer a controversy with Episcopacy, but with Popery, the great common enemy of Protestantism at large; and thus secure of the sympathy of his audience, he extracted from the works of the Popish authors the strongest arguments they had adduced in defence of their system, for the purpose of refuting them. But these arguments were the very same which Adamson had used in the forenoon, in favour of the spiritual government of kings and bishops! There, however, they stood among the ranks of the uncircumcised; and as such, they were attacked with an amount of Scripture and learning, and a force and fervour of eloquence, as completely swept them off the field. It was now the archbishop's turn to bestir himself, but he was dumb—dumb as the bench he sat upon. At last, the king advanced to the rescue; and after making several logical *distingues*, upon which he harangued for some time, he ended by commanding the students to reverence and obey his archbishop. When James departed, Du Bartes stayed behind a whole hour, conversing with Andrew Melville, after which he mounted his horse, and rejoined his majesty. The king wished to know the opinion of the foreigner upon the two men they had heard; to

which Du Bartes replied, that they were both learned men, but that the prelate's lectures were conned and prepared, while Melville had a great and ready store of all kinds of learning within him; and that his spirit and courage were far above the other. In this correct estimate James completely agreed.

From this period the life of Adamson was but a brief and mournful record. After his late discomfiture, he became weary of teaching in the college, and seems to have remitted it in a great measure to his successful rival. The ministrations of the pulpit could not console him, as the audiences either avoided him as an excommunicated man, or tarried and listened as to the voice of an intruder. Fresh complaints were made against him in the church courts, of having collated unworthy persons to benefices within his diocese. And, to crown all, he finally lost the favour and protection of the king, whom he had served only too well, but who was now weary of an archbishop buried under debt and disgrace, and whose season of working seemed well nigh over. Broken in health as well as in spirit, it might have been thought that James would at least have suffered such a faithful servant to depart in peace; but as if his own ungrateful hand, and no other, ought to deal the final blow, he alienated from him whatever of the revenues of his diocese he was still permitted to enjoy, and bestowed them upon the young Duke of Lennox, the son of his early favourite. In 1591, Adamson was dying a heart-broken man, and unable to procure for himself and his family even the common necessities of life. But besides hollow friends, he had generous enemies, and these last came forward in the hour of his extremity. Such especially were the two Melvilles, whom he had persecuted in the season of his ascendancy, but who now supported him for several months at their own expense. At last, he was reduced to such miserable shifts, that he entreated a charitable collection to be made for him among the brethren in the town of St. Andrews; and as an inducement, he offered to repair to the pulpit, and there make open confession of his offences. This, indeed, his sickness prevented him from accomplishing; but he rendered an equivalent, in a distinct "Recantation," which he subscribed, and sent to the synod of St. Andrews. Besides thus showing how little he had cared for Episcopacy, and how much he had used it for his own aggrandizement, he evinced the force of his early and long-concealed convictions in favour of Presbyterianism, by the remorse which he now felt at the thought of his excommunication, and his earnestness to be absolved from the sentence; and to this effect he sent a supplication to the presbytery of St. Andrews. They deputed two of the brethren, one of whom was James Melville, to examine him, and, if they judged fit, to release him. As soon as the dying man saw Melville, he rose up in bed, plucked the night-cap from his head, and exclaimed, "Forgive, forgive me, for God's sake, good Mr. James, for I have offended and done wrong to you many ways!" Melville spoke to him of his sin against Christ and his church, exhorted him to repentance, with the assurance of mercy from God if he repented, and forgave him with all his heart. His excommunication was then spoken of, and he was asked if he acknowledged its lawfulness. To this his emphatic reply, which he repeated again and again, was, "Loose me, for Christ's sake!" His state and petition were fully reported to the presbytery, and he was forthwith absolved. Even yet, as appears from his "Recantation," he had hoped to struggle through this his last illness; and he professed in it his earnest desire and purpose to commence a better

life, and repair the evils he had inflicted upon religion and the church. But his new-born sincerity was not to be thus tried, and he died in the lowest depths of his humiliation and repentance. His character is thus strongly and briefly summed up by James Melville, who knew him well, and witnessed his career from its height to its mournful termination:—"This man had many great gifts, but especially excelled in the tongue and pen; and yet, for abusing of the same against Christ, all use of both the one and the other was taken from him, when he was in greatest misery and had most need of them. In the latter end of his life, his nearest friends were no comfort to him, and his supposed greatest enemies, to whom indeed he offered greatest occasion of enmity, were his only friends, and recompensed good for evil, especially my uncle Andrew, but found small tokens of any spiritual comfort in him, which chiefly he would have wished to have seen at his end. Thus God delivered his kirk of a most dangerous enemy, who, if he had been endowed with a common civil piece of honesty in his dealing and conversation, he had more means to have wrought mischief in a kirk or country, than any I have known or heard of in our island."

As will be surmised from the foregoing account, Patrick Adamson was both an able and a voluminous writer; but most of his productions were merely written for the day, and have passed away with the occasions in which they originated. Some of them he never purposed to acknowledge, while others remained unpublished in manuscript. Most of these he confessed and regretted in his "Recantation," declaring, that if it should please God to restore his health, he would change his style, "as Cajetan did at the Council of Trent." His principal writings were collected and published, in one quarto volume, by Thomas Volusus (Wilson) in 1619; but notwithstanding their undoubted excellence, it may be questioned if they are now at all known beyond the library of the antiquary. It appears that on becoming minister of Paisley, Adamson married the daughter of a lawyer, who survived him, and by whom he had a family; but all record of them has passed away, so that he may be said to have been the last, as he was the first, of his race. The precise date of his death has not been mentioned; but it was in the latter part of the year 1591. Such was the career and end of the great antagonist and rival of Andrew Melville.

AGNEW, SIR ANDREW, of Lochnaw, Bart., Lieutenant-General. The family of Agnew lays claim, and probably with justice, to a more illustrious antiquity than most of our Scottish noble houses. The Agnews entered Scotland in the reign of David II., where they acquired the lands of Lochnaw, and were invested with the offices of heritable constables and sheriffs of Wigtonshire.

The subject of the present memoir, and fifth baronet of Lochnaw, was born in 1687, and was the eldest son of a family of twenty-one children. This was a truly patriarchal number; but he lived almost to equal it, being himself ultimately the father of seventeen sons and daughters by one mother, the daughter of Agnew of Creoch. Sir Andrew embraced the military profession at an early period, as many of his family had done, and was an officer in the great Marlborough campaigns, as we find him a cornet in the second regiment of dragoons or Scots Greys at the battle of Ramilies, when he had just reached his nineteenth year. It was in this capacity, and under such training, that besides being a skilful and successful officer, he became distinguished by

those deeds of personal daring, as well as eccentric peculiarities of manner, that long made him a favourite in the fireside legends of the Scottish peasantry. Among these, we are told, that on one occasion having been appointed to superintend the interment of the slain after one of the continental engagements, his orderly came to him in great perplexity, saying, "Sir, there is a heap of fellows lying yonder, who say they are only wounded, and won't consent to be buried like the rest: what shall I do?" "Bury them at once," cried Sir Andrew, "for if you take their own word for it, they won't be dead for a hundred years to come!" The man, who understood nothing beyond the word of command, made his military salaam and went off with full purpose to execute the order to the letter, when he was checked by a counter-order from his superior, who perhaps little thought that his joke would have been carried so far. On another occasion, when an engagement was about to commence, he pointed to the enemy, and thus briefly and pithily addressed his soldiers: "Weel, lads, ye see these loons on the hill there: if ye dinna kill them, they'll kill you."

When the battle of Dettingen took place, which occurred in 1743, where George II. commanded the British troops in person, Sir Andrew Agnew held the rank of lieutenant-colonel, and was appointed to keep a pass at the outskirts of the British army, through which an attack of the French was apprehended. On this post of danger the knight of Lochnaw stationed himself with his regiment of Scots Fusiliers as coolly as if he had been upon the boundary of one of his own farms in Wigtonshire. One day, while at dinner, he was informed that there were symptoms of a coming attack—that the enemy's cavalry were mustering at no great distance. "The loons!" cried Sir Andrew indignantly; "surely they will never hae the impudence to attack the Scots Fusiliers!" and forthwith ordered his men to finish their dinner quietly, assuring them that they would fight all the better for it. He continued eating and encouraging his officers to follow his example, until the enemy were so nigh, that a shot struck from his hand a bone which he was in the act of picking. "They are in earnest now!" he cried, and drew up his men to receive the enemy, who came on at full charge. They were a portion of the royal household troops, the picked and best-disciplined soldiers of France, mounted upon heavy and powerful horses, and armed with cuirasses that were buckled close to the saddle, so that the point of a bayonet could not easily find entrance within their steel panoply. Sir Andrew, who knew that it was useless to abide such an avalanche of man and horse, ordered his soldiers not to fire until they saw the whites of their enemy's eyes, to take aim only at their horses, and open their ranks as soon as a charge was made upon them. This skilful manœuvre succeeded as he had foreseen—the French horses were brought down in heaps, their riders easily bayoneted, and the far-famed household troops were driven back with heavy loss. After the battle, George II. observed, "Well, Sir Andrew, I hear that your regiment was broken; that you let the French cavalry in upon you." "Yes, please your majesty," replied the gallant humourist, "but they didna gang back again."

The most important military service, however, in which Sir Andrew Agnew was engaged, was the defence of Blair Castle against the troops of the Pretender, during the insurrection of 1745-6. On the arrival of the Duke of Cumberland in Perth, to take the command of the royalist army, he found it necessary to occupy and garrison Blair Castle, the

seat of the Duke of Athol, then absent, for the purpose of suppressing the disaffected of the district, and cutting off the communications of the rebels by the great roads between the southern and northern parts of the country. For this service Sir Andrew was selected, and despatched thither with a detachment of three hundred soldiers. Not only was no siege expected, but the place was ill fitted to sustain one; for it was scantily supplied with provisions, and had no artillery or military stores, while the soldiers had only nineteen rounds of ammunition per man. Of all this the rebels seem to have been apprised, and accordingly, on the morning of the 17th of March, 1746, Lord George Murray (the Pretender's lieutenant-general), Lord Nairne, Macpherson of Clunie, and other Jacobite leaders, resolved to recover the castle, and open their communications. They came, therefore, in great force, captured the detached parties that were without the castle, and suddenly appeared before the fort itself, while such a visit was neither expected nor desired. Most commanders in such a situation would have abandoned the fort as untenable; but Sir Andrew had not thus learned his military lessons under the great Marlborough: he resolved to defend it to the last, notwithstanding its impoverished condition, and thus give time for the collection of those forces by which the insurrection was soon after extinguished at Culloden. He therefore issued strict orders to his garrison, now reduced to 270 men, to save their ammunition with the utmost care; and, as there were no provisions in the castle but some bread and cheese, he commanded these to be dealt out in small daily rations.

As the obtaining of Blair Castle was of the utmost importance to the rebels, Lord George Murray, their ablest commander, commenced the siege in due form. He began by a summons to surrender; and knowing the old knight's fiery temper, he wrote to him to this effect, not upon decent foolscap, but a piece of shabby gray paper. But who was to enter the lion's den, and beard him with such a missive? No Highlander could be found to undertake the task, so that it was intrusted to a comely young servant maid of Blair Inn, who had found favour in the eyes of Sir Andrew's young officers while they resorted there, and who thought that they would not allow her to be harmed. She approached the garrison, taking care to avoid being shot by waving the paper over her head like a flag of truce. When she delivered her credentials, she earnestly entreated the officers to surrender, assuring them that the Highlanders were a thousand strong, and would *ding* the castle about their ears; but this friendly warning they only received with peals of laughter, telling her that they would soon set these Highlanders a scampering, and visit her at the inn as before. No one, however, would deliver the summons to Sir Andrew, except a timid lieutenant of the company, whose nerves were further unstrung by the use of strong waters; but no sooner did the old knight hear the first sentence read, than he burst forth into such a storm of wrath, and uttered such fearful threats of shooting the next messenger through the head who dared to propose a surrender, that the lieutenant took to his heels, while Molly, who stood at the bottom of the stairs, and heard the whole, fled across the fields like a startled hare. She told her employers, waiting in the churchyard of Blair, the result of her mission, who laughed heartily at the rage of Sir Andrew. Still further to provoke him, and perhaps tempt him to a rash sally, they threw large stones at the walls, accompanied with biting jokes at his expense; but fiery though his temper

was, and impatient of ridicule, he was too wary a soldier to afford them such an advantage. In the meantime, the more serious work of the siege went on with vigour, and, though the walls of Blair Castle were of great thickness, the assailants not only used common, but also hot shot, in the hope of setting the building on fire. The wood, being luckily not very combustible, only smouldered as it received the balls. But the chief confidence of the rebels was to starve the garrison out, knowing how scantily it was supplied; and for this purpose they strictly blockaded the place, while their best marksmen were ordered to keep up a close fire wherever a man showed himself. This last incident suggested to the officers of the castle a practical joke at the expense of their commander, whom they loved, feared, and laughed at when they dared. They got one of his old uniforms; and having stuffed it with straw and furnished the figure with a spy-glass, they placed it at a small turret window, where it looked like no other than Sir Andrew himself reconnoitring the enemy below. The rifles of the assailants were all brought to bear upon it, and the best marksmen of the Highlands continued to riddle this deceptive wisp, until Sir Andrew himself, wondering why this point should have been selected for such a hot attack, ascended the turret, and there he saw this other identity standing under fire, as stiff, fearless, and imperturbable as himself! He was in a towering rage at the irreverent joke, and resolved that the perpetrator should not escape a share of it. The wag was ordered to go to this spot so full of risk, and carry the puppet away, Sir Andrew gruffly pronouncing this retributive sentence: "Let the loon that set it up, just gang up himsel' and tak' it down again."

Beyond all military calculation, Sir Andrew Agnew, with miserably scanty means, had made good his position from the 17th of March to the end of the month. Longer than this, however, it was impossible to hold out, as the provisions of the garrison were exhausted, so that nothing seemed to be left them but a desperate sally, or immediate surrender. A faint chance indeed there might be of some messenger stealing through the leaguer, and carrying tidings of their condition to the Earl of Crawford, who was then at Dunkeld with a strong force of Hessians. This was now attempted, and the gardener of Blair Castle undertook to be the messenger. The gate was opened without noise; he stole out unperceived, mounted a horse, and rode cautiously down the avenue to the highway; but immediately a firing and pursuit commenced, and, on the following day, a Highlander was seen mounted on the gardener's horse, so that the garrison thought he must have been either killed or taken. On the 1st of April, however, they were startled by an unexpected messenger; this was no other than Molly of the inn, formerly the envoy of the rebels, who now came with the joyful intelligence that they had broken up their encampment, and gone away to Dalnacardoch. Sir Andrew, who was not only wary but short-sighted, would not trust the news, and abode a day longer in his hunger-bitten hold, when an officer arrived from the Earl of Crawford, to say that his lordship himself was on the road with his cavalry, and would arrive within an hour. Such was the case; for the gardener's horse, being alarmed at the firing, had thrown him, and been captured by the Highlanders, so that he had made his journey to Dunkeld on foot. When Crawford arrived, Sir Andrew drew up his soldiers to receive him, and thus addressed the earl: "My lord, I am very glad to see you; but, by all that's good, you have been

very dilatory; we can give you nothing to eat." The earl laughed good humouredly, and invited Sir Andrew and his officers to dine with him—an invitation that was never more welcome, perhaps, than at the present crisis. The summer-house in the garden was immediately turned into a dining-room, the table was plentifully covered with substantial dishes and excellent wines, and the half-starved and doomed defenders of Blair Castle were translated, as if by magic, into the regions of safety, hilarity, and good cheer.

After the siege was thus raised, Sir Andrew Agnew's gallant defence was not forgot. He and his soldiers were publicly thanked by the Duke of Cumberland, and soon afterwards he was promoted to a colonelcy of marines. In 1747, in consequence of the abolition of the many old feudal offices in Scotland, his hereditary sheriffdom of Wigtonshire was among the number; but he received £4000 as a compensation from government. In 1750 he was appointed governor of Timmouth Castle, in room of the Duke of Somerset. He died, with the rank of lieutenant-general, in 1771, at the age of eighty-four, and was succeeded by his fifth son, Sir Stair Agnew, who was born October 9, 1734. His father, who at that period was absent on foreign service, found at his return the infant nestled in the maternal bosom. "What's this ye hae got, Nelly?" he asked, as this was the first intelligence he had of the event. "Another son to you, Sir Andrew," she answered. "And what do you call this boy?" "I have called him Stair, after the earl, your commander." "Stair, Sir Stair," repeated the knight, whistling the sibilant sounds through his teeth—"Sir Stair, Sir Deevil! It disna clink weel, Nelly." The sounds, however, were at last united, whether they clinked or not, for the child, by the death of his elder brothers, ultimately succeeded to the baronetcy of Lochnaw.

AIDAN, SAINT, Bishop of Lindisfarne in the seventh century, was originally a monk in the island of Iona, and afterwards became a missionary in England. The causes that brought Aidan to England were the following:—Oswald having recovered the kingdom of Northumbria from its pagan oppressors, by a signal and surprising victory, his piety attributed this success to the aid of the true God, whom he had invoked; and the first movement of his reign was to arrest the growing heathenism of his people, and recall them to the Christian faith. For this purpose he applied, however, not to the Italian monks, as his uncle had done, but to the Culdees of Iona; among whom he had been sheltered in his early youth, during the disasters of his family, and by whom he had been carefully educated. The message was gladly received by the Culdee brethren, and Cormac, a learned monk of their order, was forthwith sent to Northumbria. But the savage manners of the people appalled him, their inability to comprehend his instructions disgusted him, so that, despairing of their conversion, he speedily returned home. While he was giving an account of his mission, and describing the Northumbrians as a race of impracticable savages, a voice of rebuke was suddenly heard in the assembly: "Brother, it seems to me that your want of success was owing to a want of condescension to your hearers. You should first have fed them with milk, according to the apostolic rule, until they were fitted to receive stronger food." All eyes were turned upon the speaker, who was Aidan. It was unanimously agreed by the assembly that he was the fittest person to attempt the conversion of the Northumbrians, and, on the charge being proposed to him, he cordially agreed. He arrived in

England A. D. 634, and repaired to the court of king Oswald. And now a missionary work commenced in the Northumbrian kingdom such as missionary annals can seldom parallel, for both king and monk went hand in hand in the duty. Aidan, being a Celt, was either wholly ignorant of the Saxon language of his hearers or imperfectly acquainted with it; but, when he preached, Oswald was ready to interpret his addresses. The happiest results attended these joint labours. The ancient idolatry was utterly thrown aside, and Christianity established over Deira and Bernicia. Still further to confirm this change, Aidan prevailed upon the king to transfer the episcopal see from York to Lindisfarne, or Holy Island, a bleak peninsula upon the coast of Northumberland, which probably the Culdee preferred from its resemblance to his own beloved Iona, and here accordingly a monastery was erected, which Aidan supplied with monks from his own country.

After the death of Oswald, who was slain in battle, the kingdom of Northumbria was once more parted into two sovereignties, those of Deira and Bernicia; in the former of which Oswin was appointed king, and in the latter Oswio. It was, however, a peaceful conjunction; and Aidan still continued, as before, to preside over the church of Northumberland. The character of Oswin appears to have fully resembled that of his amiable predecessor, and the Bishop of Lindisfarne seems to have loved him with a still higher affection than even that which he bore for Oswald. Amidst the obscurity of that remote period, and the shadowy character of its actors, Bede tells us a touching story, in which the simple manners of the times, as well as the intercourse between the king and the bishop, are brought out in strong relief. Oswin had once presented to Aidan a fine horse. It happened that one day, as the Culdee was riding forth, he met a poor man who asked of him an alms, and Aidan, having no money, bestowed on him the horse and its rich trappings. The king on hearing of this was displeased, and could not refrain from expressing his resentment when Aidan next dined with him. "Why were you so lavish of my favour," he said, "as to give away my pad to a beggar? If you must needs mount him on horseback, could you not have given him one of less value? Or, if he wanted any other relief, you might have supplied him otherwise, and not have parted so easily with my gift." "You have not carefully considered this matter," replied Aidan, "for otherwise you could not set a greater value on the son of a mare, than on a son of God." In this way the affair ended for the present. Not long after, when the king returned from hunting, he saw the bishop, and, remembering what had lately occurred, he laid aside his sword, threw himself at the good man's feet, and asked his forgiveness for the rude words he had uttered. Aidan, grieved to see the king in this posture, immediately raised him, and declared that the whole matter was forgot. After this interview, however, Aidan was observed to be very sad; and, on being asked the cause by some of his monks, he burst into tears, and replied, "How can I be otherwise than afflicted? I foresee that Oswin's life will be short, for never have I beheld a prince so humble. His temper is too heavenly to dwell long among us, and, truly, the nation does not deserve the blessing of such a ruler." This mournful prediction was soon after accomplished by the death of Oswin, who was assassinated in August, 651; and Aidan took the matter so deeply to heart, that he died a fortnight after.

Such is the little that we know of Saint Aidan, the apostle of Northumberland and Bishop of Lindis-

farnie. That he was great and good, and that he accomplished much, is evident from the old chronicles, and especially from the history of venerable Bede, from whom the foregoing brief account has been chiefly gathered.

AIKMAN, WILLIAM, a painter of considerable merit of the last century, was born in Aberdeenshire, October 24, 1682. His father was William Aikman of Cairney, a man of eminence at the Scottish bar, who educated his son to follow his own profession. But a predilection for the fine arts, and a love of poetry, which gained him the friendship of Ramsay and Thomson, induced the youth to give up studying for the law, and turn his attention to painting. Having prosecuted his studies in painting for a time at home under Sir John Medina, and also in England, he resolved to visit Italy, that he might complete his education as an artist, and form his taste by an examination of the classic models of antiquity; and accordingly, in 1707, having sold his paternal estate near Arbroath, that he might leave home untrammelled, he went to Rome, where, during a period of three years, he put himself under the tuition of the best masters. He afterwards visited Constantinople and Smyrna, where the gentlemen of the English factory wished him to engage in the Turkey trade; an overture which he declined; and returning to Rome, he there renewed his studies for a time. In 1712 he revisited his native country, and commenced practising his profession; but though his works were admired by the discerning few, he did not meet with adequate encouragement, the public being too poor at that time to purchase elaborate works of art, and the taste for such works being then too imperfectly formed. At this period he formed an intimacy with Allan Ramsay, whose portrait he afterwards painted. John, Duke of Argyll, who equally admired the artist and esteemed the man, regretting that such talents should be lost, at length prevailed upon Aikman, in 1723, to move with all his family to London. There, under the auspices of his distinguished friend, he associated with the most eminent British painters of the age, particularly Sir Godfrey Kneller, whose studies and dispositions of mind were congenial with his own. The duke also recommended him to many people of the first rank, particularly the Earl of Burlington, so well known for his taste in architecture; and he was thus able to be of much service to Thomson, who came to London soon after himself, as a literary adventurer. He introduced the poet of *The Seasons* to the brilliant literary circle of the day—Pope, Swift, Gay, Arbuthnot, &c.—and, what was perhaps of more immediate service, to Sir Robert Walpole, who aimed at being thought a friend to men of genius. Among the more intimate friends of Aikman was William Somerville, author of *The Chase*, from whom he received an elegant tribute of the muse, on his painting a full-length portrait of the poet in the decline of life, carrying him back, by the assistance of another portrait, to his youthful days. This poem was never published in any edition of Somerville's works. Aikman painted, for the Earl of Burlington, a large picture of the royal family of England; all the younger branches being in the middle compartment, on a very large canvas, and on one hand a full-length portrait of Queen Caroline; the picture of the king (George II.)—that king who never could endure "boetry or bainting," as he styled the two arts in his broken English—intended for the opposite side, was never finished, owing to the death of the artist. This was perhaps the last picture brought towards a close by Aikman, and it

is allowed to have been in his best style; it came into the possession of the Duke of Devonshire by a marriage alliance with the Burlington family. Some of his earlier works are in the possession of the Argyle and Hamilton families in Scotland; his more mature and mellow productions are chiefly to be found in England, and a large portion at Blickling, in Norfolk, the seat of the Earl of Buckinghamshire; these are chiefly portraits of noblemen, ladies, and gentlemen, friends of the earl. He died, June 4, 1731, at his house in Leicester Fields, and, by his own desire, his body was taken to Scotland for interment; his only son, John (by his wife Marion Lawson, daughter of Mr. Lawson of Cairnmuir, in Peebleshire), whose death immediately preceded his own, was buried in the same grave with him, in the Greyfriars' Churchyard, Edinburgh. A monument was erected over the remains of Mr. Aikman, with the following epitaph by Mallet, which has been long since obliterated:—

"Dear to the good and wise, dispraised by none,
Here sleep in peace the father and the son.
By virtue as by nature close allied,
The painter's genius, but without the pride.
Worth unambitious, wit afraid to shine,
Honour's clear light, and friendship's warmth divine.
The son, fair-rising, knew too short a date;
But O how more severe the parent's fate!
He saw him torn untimely from his side,
Felt all a father's anguish—wept, and died."

In his style of painting Aikman seems to have aimed at imitating nature in her most simple forms; his lights are soft, his shades mellow, and his colouring mild and harmonious. His touch has neither the force nor the harshness of Rubens; nor does he, like Reynolds, adorn his portraits with the elegance of adventitious graces. His compositions are distinguished by a placid tranquillity, rather than a striking brilliancy of effect; and his portraits may be more readily mistaken for those of Kneller than for the works of any other eminent artist.

AINSLIE, HEW. This poet, whose songs in the Scottish dialect have obtained considerable popularity, was born April 5th, 1792, at Bargeny Mains, in the parish of Dailly, Ayrshire. He was first educated by a private tutor at home, afterwards at the parish school of Ballantrae, and finally at the academy of Ayr. On leaving the academy, he became assistant landscape gardener on the estate of Sir Hew Dalrymple Hamilton, a situation which he afterwards exchanged at the age of sixteen for that of a lawyer's clerk in Glasgow; but the confinement of the office being injurious to his health, he removed to Roslin, and subsequently obtained a clerkship in the Register Office, Edinburgh.

Like most of the tuneful class, Hew Ainslie was a poet from his early years, and had composed verses before he left his native Carrick. The practice was not neglected when his age was more matured, and in consequence of a visit to Ayrshire in 1820, his poetical ardour burst forth into authorship under the title of *A Pilgrimage to the Land of Birus*. The volume thus entitled was a duodecimo of 271 pages, printed at Deptford, "for the author," in 1822, and amidst jokes, stories, and descriptions connected with the history of our great Scottish bard, it was more plentifully interspersed with Ainslie's own poetry, which his narrative seems mainly intended to introduce. This mixture of prose and verse makes a very lively and readable book, and as such the *Pilgrimage* brought the author into considerable notice.

In the meantime Ainslie had married, had found the salary of his clerkship in the Register House

too small to maintain his family, and had moreover discovered that he was not likely to be enriched by cultivating poetry as a regular occupation. He wisely therefore resolved to emigrate to the United States, where the field was open to industrious enterprise, and where his chances were better both for health and prosperity. He accordingly arrived at New York in 1822, purchased a farm, and settled on it for three years. Still haunted however by the restless eccentricity and love of change that characterizes poets, he joined the Socialists of New Harmony, under their leader Robert Owen; but after a year's experience he renounced the system, and set up as a brewer first at Louisville, and afterwards at New Albany. But his premises having been destroyed by accident, he changed his occupation to that of the erection of mills and factories, and finally settled in Jersey, a suburb of New York.

Thus far we have been enabled to trace the course of Hew Ainslie in America, and until 1855, in which he published a volume of *Scottish Songs, Ballads, and Poems*, at New York; but after this period our information deserts us, so that we neither know how he prospered in his old age, nor in what year he died. That he had never ceased, however, to cultivate poetry as his first love, or to remember Scotland with a filial devotedness, his last publication is a satisfactory proof. Their Scottish raciness is as complete as if he still trode his native heather, instead of having been a sojourner for more than thirty years in America. Their merit also is so far above mediocrity, that they will be remembered and cherished in Scotland long after the history of their author is forgot.

AITON, WILLIAM, an eminent horticulturist and botanist, was born, in 1731, at a village in the neighbourhood of Hamilton. Having been regularly bred to the profession of a gardener, as it was and still is practised by numbers of his countrymen, with a union of manual skill and scientific knowledge, he removed to England in 1754, and, in the year following, obtained the notice of the celebrated Philip Miller, then superintendent of the physic garden at Chelsea, who employed him for some time as an assistant. The instructions which he received from that eminent gardener laid the foundation, it is said, of his future fortune. His industry and abilities were so conspicuous, that, in 1759, he was pointed out to the Princess-dowager of Wales as a fit person to manage the botanical garden at Kew. His professional talents also procured him the notice of Sir Joseph Banks, and a friendship commenced which subsisted between them for life. Dr. Solander and Dr. Dryander were also among the number of his friends. The encouragement of botanical studies was a distinguishing feature of the reign of George III., who, soon after his accession, determined to render Kew a repository of all the vegetable riches of the world. Specimens were accordingly procured from every quarter of the globe, and placed under the care of Mr. Aiton, who showed a surprising degree of skill in their arrangement. Under his superintendance a variety of improvements took place in the plan and edifices of Kew Gardens, till they attained an undoubted eminence over every other botanical institution. In 1783, on a vacancy occurring in the superintendance of the pleasure-gardens at Kew, Mr. Aiton received the appointment from George III., but was, at the same time, permitted to retain his more important office. His labours proved that the king's favours were not ill bestowed; for, in 1789, he published an elaborate description of the plants at Kew, under the title *Hortus*

Kewensis, 3 vols. 8vo, with a number of plates. In this production Mr. Aiton gave an account of no fewer than 5600 foreign plants, which had been introduced from time to time into the English gardens; and so highly was the work esteemed, that the whole impression was sold within two years. A second and improved edition was published by his son, William Townsend Aiton, in 1810. After a life of singular activity and usefulness, distinguished moreover by all the domestic virtues, Mr. Aiton died on the 1st of February, 1793, of a schirrus in the liver, in the sixty-third year of his age. He lies buried in the churchyard at Kew, near the graves of his distinguished friends, Zoffany, Meyer, and Gainsborough. He was succeeded by his son, Mr. William Townsend Aiton, who was no less esteemed by George III. than his father had been, and who for fifty years ably superintended the botanical department at Kew, besides taking charge of the extensive pleasure-grounds, and being employed in the improvement of the other royal gardens. In 1841 he retired from office, when Sir William J. Hooker was appointed director of the botanic gardens. Mr. Aiton died at Kew in 1849, aged eighty-four.

ALES, or **ALESSE**, **ALEXANDER**, a celebrated theologian of the sixteenth century, was born at Edinburgh, April 23, 1500. He is first found in the situation of a canon in the cathedral of St. Andrews, where he distinguished himself by entering into the prevalent controversy of the day against Luther. His zeal for the Roman Catholic religion was staggered by the martyrdom of Patrick Hamilton; but it is not probable that his doubts would have been carried further, if he had not suffered persecution for the slight degree of scepticism already manifested. Being obliged to flee from St. Andrews, he retired to Germany, where he became a thorough convert to the Protestant doctrines. The reformation in England induced Ales to go to London, in 1535, where he was highly esteemed by Cramer, Latimer, and Cromwell, who were at that time in favour with the king. Henry regarded him also with favour, and used to call him "his scholar." Upon the fall of Cromwell, he was obliged to return to Germany, where the Elector of Brandenburg appointed him professor of divinity at Frankfort-upon-the-Oder, in 1540. As a reformer Ales did not always maintain the most orthodox doctrines; hence he was obliged, in 1542, to flee from his chair at Frankfort, and betake himself to Leipsic. He spent the remainder of his life in that city, as professor of divinity, and died in 1565. His works are:—1. *De Necessitate et Merito Bonorum Operum, Disputatio Proposita in Celebris Academia Leipsica, ad 29 Nov. 1580.* 2. *Commentarii in Evangelium Joannis, et in utramque Epistolam ad Timotheum.* 3. *Expositio in Psalmos Davidis.* 4. *De Justificatione, contra Oscandrum.* 5. *De Sancta Trinitate, cum Confutatione Erroris Valentini.* 6. *Responsio ad triginta et duos Articulos Theologorum Lovaniensium.* The fifth in this list is the most favourable specimen of his abilities.

ALEXANDER, **WILLIAM**, an eminent nobleman, statesman, and poet of the reign of James VI. and Charles I. The original rank of this personage was that of a small landed proprietor or laird; but he was elevated, by dint of his various accomplishments, and through the favour of the two sovereigns above-mentioned, to the rank of an earl. His family, which possessed the small estate of Menstrie, near Stirling, is said to have derived the name Alexander from the prenomen of their ancestor, Alexander

Macdonald, a Highlander who had been settled in this property by the Earl of Argyle, whose residence of Castle Campbell is in the neighbourhood. William Alexander is supposed to have first seen the light in 1580. He received from his friends the best education which the time and place could afford, and at a very early age he accompanied the young Earl of Argyle upon his foreign travels, in the capacity of tutor. Previous to this period, when only fifteen years of age, he had been smitten with the charms of some country beauty, "the cynosure of neighbouring eyes;" on his return from the Continent he wrote no fewer than a hundred sonnets, as a ventilation to the fervours of his breast; but all his poetry was in vain, so far as the lady was concerned. She thought of matrimony, while he thought of love, and accordingly, on being solicited by a more aged suitor, in other respects eligible, she did not scruple to accept his hand. The poet took a more sensible way of consoling himself for this disappointment than might have been expected; he married another lady, the daughter and heiress of Sir William Erskine. His century of sonnets was published in London in 1604, under the title of *Aurora, containing the First Fancies of the Author's Youth*, by W. Alexander, of Menstrie. He had early been introduced to royal notice; and when James removed to London, in 1603, the poet did not remain long behind, but soon became a dependant upon the English court. In this situation, however, he did not, like most court poets of that age, employ his pen in the adulation of majesty; his works breathe a very different strain: he descanted on the vanity of grandeur, the value of truth, the abuse of power, and the burden of riches; and his moralizings assumed the strange shape of tragedies—compositions not at all designed for the stage, but intended to embody his sentiments upon such subjects as those we have mentioned. His first tragedy was grounded upon the story of Darius, and appeared at Edinburgh in 1603. He afterwards republished it at London, in 1607, along with similar compositions upon the stories of Alexander, Cæsar, and Cæsar, under the title of *Monarchick Tragedies*, by William Alexander, gentleman of the Princes' Privy Chamber. It would thus appear that he had now obtained a place in the household of Prince Henry; to whom he had previously addressed a poem or parænesis, designed to show how the happiness of a sovereign depends upon his choice of worthy councillors. This poem, of which no copy of the original edition is known to exist, except one in the university library at Edinburgh, was, after the death of Henry, addressed to Prince Charles, who then became heir-apparent; an economy in poetical, not to speak of court business which cannot be sufficiently admired. He was, in 1613, appointed one of the gentlemen ushers of the presence to this unfortunate prince.

King James is said to have been a warm admirer of the poems of Alexander, to have honoured him with his conversation, and called him "my philosophical poet." He was now aspiring to the still more honourable character of a divine poet, for in 1614, appeared at Edinburgh his largest and perhaps his most meritorious production, entitled *Doomsday, or the Great Day of Judgment*, which has been several times reprinted.

Hitherto the career of Alexander had been chiefly that of a poet: it was henceforth entirely that of a courtier. In 1614 he was knighted by King James, and appointed to the situation of master of requests. In 1621 the king gave him a grant by his royal deed of the province of Nova Scotia, which as yet had not been colonized. Alexander designed at first to

establish settlers upon this new country, and as an inducement to the purchase of land, it was proposed that the king should confer upon all who paid a hundred and fifty pounds for 6000 acres the honour of a knight baronetcy. Owing to the perplexed politics of the last years of King James, he did not get this scheme carried into effect, but Charles had no sooner acceded than he resolved upon giving it his support. Alexander, in 1625, published a pamphlet, entitled *An Encouragement to Colonies*, the object of which was to state the progress already made, to recommend the scheme to the nation, and to invite adventurers. It is also supposed that he had a hand in *A Brief Relation of the Discovery and Plantation of New England*, and of sundry accidents therein occurring from the year 1607 to this present 1622; together with the state thereof as it now standeth, the general form of Government intended, and the division of the whole territory into Counties, Baronies, &c. King Charles, who probably considered the scheme in a twofold light, as a means of establishing a new colony, and of remunerating an old servant at the expense of others, conferred upon Sir William Alexander the rank of Lieutenant of New Scotland, and founded the necessary order of knights baronets of the same territory. The number of these baronets was not to exceed a hundred and fifty, and it was ordained that the title should be hereditary—that they should take precedence of all ordinary knights and lairds, and of all other gentlemen, except Sir William Alexander, and that they should have place in all his majesty's and his successors' armies, near and about the royal standard for the defence thereof, with other honourable distinctions of precedence, to them, their wives, and heirs. The ceremony of infeftment or seisin was decreed to take place on the Castle-hill of Edinburgh, the earth and stone of which were held, by a fiction, to represent the component particles of certain baronies and lordships on the other side of the Atlantic. But the Nova Scotian scheme, whatever might have been originally contemplated, degenerated at last into a mere means of raising money by the sale of titles; a system too much practised in the English reign of James VI., and which gained, as it deserved, the contempt of all honourable minds. The territory of Nova Scotia afterwards fell into the hands of the French, who affected to believe that they had acquired a right to it by a treaty entered into with the king of Great Britain, in 1632, in which the country of Acadia was ceded to them. In the treaty of peace transacted between the two countries, in 1763, it was successfully asserted by the British government that Nova Scotia was totally distinct from Acadia, and accordingly the territory reverted to Britain, along with Canada. The country, however, having become the property of other individuals during the usurpation of the French, it appears that the Nova Scotia baronets have very slight prospects of ever regaining the lands to which their titles were originally attached.

In 1626 Sir William Alexander was, by the favour of Charles I., made secretary of state for Scotland, an office to which the salary of £100 a year, being that of a good mercantile clerk in the present day, was then attached. In 1630, by the further favour of his sovereign, he was raised to the peerage under the title of Viscount Stirling; and in 1633, at the coronation of King Charles in Holyrood Chapel, he was promoted to the rank of an earl under the same title. He held the office of secretary during fifteen years, and gained the credit of being a moderate statesman in the midst of many violent political scenes. It does not appear, however, that he was a

popular character. Such esteem as he might have gained by his poetry seems to have been lost in consequence of his arts to become rich. A permission which he acquired, probably in his character of lieutenant of Nova Scotia, to coin base money, became a grievance to the community, and procured him much obloquy. He had erected a splendid mansion at Stirling out of his ill-acquired gains, and affixed upon its front his armorial bearings, with the motto "Per mare, per terras." This was parodied, as we are informed, by the sarcastic Scott of Scotstarvet, into "Per metre, per turners," in allusion to the sources of his wealth, the people believing that the royal favour had a reference to his lordship's poetry, while *turners*, or *black furlings*, as they were otherwise called, had been one of the shapes in which this favour was expressed. The house still remains a monument of the taste of the poet.

The Earl of Stirling in 1637 published a complete edition of his poetical works, under the general title of *Recreations with the Muses*. The work contained his four "Monarchick Tragedies," his "Doomsday," the "Parenesis to Prince Henry," and "Jonathan, an Heroick Poem Intended, the first book," the whole revised and very much improved by the author. He died in 1640, leaving three sons and two daughters, whose posterity was supposed to have been completely extinct, till a claimant appeared in 1830, as descended from one of the younger branches of the family, and who assumed the titles of Stirling and Devon. Considered as a poet, Alexander is entitled to considerable praise. "His style is certainly neither pure nor correct, which may perhaps be attributed to his long familiarity with the Scottish language; but his versification is in general much superior to that of his contemporaries, and approaches nearer to the elegance of modern times than could have been expected from one who wrote so much. There are innumerable beauties scattered over the whole of his works, but particularly in his songs and sonnets; the former are a species of irregular odes, in which the sentiment, occasionally partaking of the quaintness of his age, is more frequently new and forcibly expressed. The powers of mind displayed in his 'Doomsday' and 'Parenesis' are very considerable, although we are frequently able to trace the allusions and imagery to the language of holy writ; and he appears to have been less inspired by the sublimity than by the awful importance of his subject to rational beings. A habit of moralizing pervades all his writings; but in the 'Doomsday' he appears deeply impressed with his subject, and more anxious to persuade the heart than to delight the imagination."—*Johnson and Chalmers' English Poets*, edit. 1810, vol. v.

The Earl of Stirling was employed in his latter years in the task of revising the version of the Psalms prepared by King James, which duty was imposed upon him by the royal paraphrast himself. In a letter to his friend Drummond of Hawthornden, 28th of April, 1620, Alexander says, "Brother, I received your last letter, with the psalm you sent, which I think very well done: I had done the same long before it came; but he [King James] prefers his own to all else; though, perchance when you see it, you will think it *the worst of the three*. No man must meddle with that subject, and therefore I advise you to take no more pains therein." In consideration of the pains which the earl had bestowed upon this subject, Charles I., on the 28th of December, 1627, granted a license to his lordship to print the late king's version of the Psalms exclusively for thirty-one years. The first edition appeared at Oxford in 1631. The king

endeavoured to enforce the use of his father's version alone throughout his dominions; and, if he had been successful, the privilege would have been a source of immense profit to the Earl of Stirling. But the royal wishes were resisted by the Scottish church, and were not very respectfully obeyed anywhere else; and the breaking out of the civil war soon after rendered the privilege entirely useless.¹

ALEXANDER I., surnamed *Acer* or the *Fierce*, King of Scots from 1106 to 1124, was the fifth son of Malcolm III. by his wife Margaret of England. Lord Hailes conjectures that his name was bestowed in honour of Pope Alexander II.; a circumstance worthy of attention, as it was the means of introducing the most common and familiar Christian name in Scotland. The date of Alexander's birth is not known; but as his four elder brothers were all under age in 1093, at the death of their father, he must have been in the bloom of life at his accession to the throne. He succeeded his brother Edgar, January 8, 1106-7, and immediately after married Sybilla, the natural daughter of Henry I. of England, who had married his sister Matilda or Maud. Such an alliance was not then considered dishonourable. Alexander was active in enforcing obedience to his rule, and in suppressing the bands of rebels or robbers with which the northern parts of the kingdom were infested; but the chief events of his reign relate to the efforts made by the English church to assert a supremacy over that of Scotland. These efforts were resisted by the King of Scots with steady perseverance and ultimate success, although the pope countenanced the claims of the English prelates. It is to be presumed that this spirit would have incited the Scottish monarch to maintain the independency of his kingdom had it ever been called in question during his reign. Alexander died, April 27, 1124, after a reign of seventeen years and three months. As he left no issue, he was succeeded by his next and last surviving brother David, so memorable for his bounty to the church. Alexander was also a pious monarch. Aldred, in his genealogy of the English kings, says of him that "he was humble and courteous to the clergy, but, to the rest of his subjects, terrible beyond measure; high-spirited, always endeavouring to compass things beyond his power; not ignorant of letters; zealous in establishing churches, collecting relics, and providing vestments and books for the clergy; liberal even to profusion, and taking delight in the offices of charity to the poor." His donations to the church were very considerable. He made a large grant of lands to the church of St. Andrews, increased the revenue of the monastery of Dunfermline which his parents had founded, established a colony of canons regular at home, and built a monastery on Inchcolm in the Firth of Forth, in gratitude for having been preserved from a tempest on that island.

ALEXANDER II., the only legitimate son of King William, surnamed the *Lion*, was born in 1198. He succeeded his father, December 4, 1214, in his seventeenth year, and was crowned next day at Scone. Alexander II. is characterized by Fordun as a pious, just, and brave king—as the shield of the church, the safeguard of the people, and the friend of the miserable. He espoused the cause of the English barons against King John, which led to mutual depredations between the two sovereigns; but

on the accession of Henry III. to the crown of England, peace was restored; and in 1221 the friendly intercourse of the two nations was established by the marriage of the King of Scotland to Joan, eldest sister of the King of England. This princess died in 1238 without issue; and in the following year Alexander married Mary de Couci, the scion of a French house, which, in its motto, disclaimed royalty, and rested for distinction on its own merits:

Je suis ni roi, ni prince aussi—
Je suis le seigneur de Couci.

During the life of Joan the British monarchs came to no open rupture, their friendly intimacy being only occasionally interrupted by Henry discovering a disposition to revive the claim of homage from the King of Scotland, which had been given up by Richard I., and by Alexander insisting on his claim to the three northern counties of England; but shortly after the death of Joan national jealousies broke out, and in 1244 both princes raised armies and prepared for war. By the mediation, however, of several English barons, hostilities were prevented, and a peace concluded. Much of Alexander's reign was occupied in suppressing insurrections of the Celtic inhabitants of Scotland. He died, A.D. 1249, in one of the islands of the Hebrides while engaged in subjecting Angus, the Lord of Argyle, who refused his homage to the Scottish sovereign. He left by his second wife one son, who is the subject of the following article.

ALEXANDER III., born at Roxburgh, September 4, 1241, succeeded his father in the eighth year of his age. He was knighted and crowned only five days after his father's death—a precipitation adopted to prevent the interference of the King of England. When only a year old Alexander had been betrothed to Margaret, eldest daughter of Henry III., a princess of his own age; and in 1251 their nuptials were celebrated at York with great pomp. On the ground of this union Henry interested himself in the affairs of Scotland, and the young prince was a frequent visitor at the court of his father-in-law. The English monarch, taking advantage of Alexander's youth and other circumstances, endeavoured to prevail upon him to do homage for his crown and kingdom of Scotland; but the young king, with a fortitude and prudence beyond his years, and which gave promise of his future decision, resisted the demand, saying that he could not treat of affairs of state without the advice of his parliament. During Alexander's minority the country was divided into factions, and various struggles for ascendancy took place; but the administration was latterly committed to fifteen of the leading chiefs or barons. Alexander had reached the twenty-second year of his age when his kingdom was invaded by one of the most formidable armaments that had ever sailed from Norway. Haco, king of that country, with a fleet of one hundred and sixty ships, freighted with many thousand northern warriors, who carried terror to almost all the shores of Europe, sailed towards Scotland in the summer of 1263, and after making himself master of the Islands of Arran and Bute, arrived in the Bay of Largs, near the mouth of the Clyde, and endeavoured to effect a landing. Here a Scottish army, under Alexander, assembled to resist the invasion; and here, on the 2d of October, after a fierce and bloody contest, the Norwegians were repulsed with great loss. A storm arising completed the dissipation or destruction of their fleet. Haco escaped with difficulty through the strait

¹ The corpse of the Earl of Stirling was deposited in a leaden coffin in the family aisle in the church of Stirling, above ground, and remained entire for upwards of a hundred years.—*Paragraph from an old newspaper.*

between Skye and the mainland, since called Kyle Hacken, and reaching the Orkneys, died there, as is said, of a broken heart. By this defeat all the islands of the western sea, including that of Man, but excepting those of Orkney and Shetland, submitted to Alexander.

From this period to the death of Alexander, Scotland enjoyed tranquillity, only disturbed by the pretensions of the pope and the encroachments of the clergy, both of which Alexander was successful in resisting. Religious crusades were at this time the rage over Europe, and Scotland did not escape the infection, as many of her bravest barons perished in Palestine. In 1274 Alexander attended the coronation of his brother-in-law, Edward I., at Westminster, and after the custom of the times did homage for the lands which he held of him in England. Six months after this, Margaret, Queen of Scotland, died, leaving one daughter and two sons—Margaret, Alexander, and David. David died unmarried in 1281. Margaret was married in 1282 to Eric, King of Norway, and died in the following year, after giving birth to an infant daughter, who received her own name. Alexander was married in 1283 to the daughter of Guy, Earl of Flanders, who died in the following year without issue. Thus, in the course of a few years, was the unhappy King of Scotland deprived of his wife and all his children—the only remaining descendant of his body being the Maiden of Norway, as she is called in Scottish history—an infant grandchild residing in a foreign land. In 1285 Alexander, to provide against the evils of a disputed succession, at the request of his nobility, married Joletta, daughter of the Count de Dreux; but shortly after his marriage, in riding along a precipitous road, between Burntisland and Kinghorn, his horse fell over a rock, and the unfortunate monarch was killed. This event took place on the 16th of March, 1286, in the forty-fifth year of his age, and thirty-seventh of his reign.

With Alexander III. terminated a race of kings, who, from the accession of Malcolm Cean-Mohr or Canmore, had distinguished themselves by their activity in the administration of justice, and their courage in maintaining the rights and independence of their country against a powerful, and too often an insidious, foe. Few annals of a rude people, indeed, can present a more remarkable series of patriotic monarchs than those with whom Scotland was blessed from the middle of the eleventh to the close of the thirteenth century, whether we consider their wisdom and impartiality as legislators, their prudence as politicians, or their bravery as warriors; for Malcolm the Maiden, and the terms upon which William the Lion effected his release from captivity, must only be considered as exceptions to the general excellence of their conduct. But with the death of Alexander III. the peace and prosperity of the country was broken up; and much as he was lamented by the people, and gloomy as were their forebodings on his decease, no anticipation could exceed the real calamities in which the country was involved by his unhappy and untimely end.

ALISON, REV. ARCHIBALD, M.A., LL.B. This distinguished writer on "Taste," was born in Edinburgh, A.D. 1757, and was the son of Mr. Andrew Alison, one of the magistrates of that city. When he had completed the usual course of an elementary classical education, he was sent, at the age of fifteen, to the university of Glasgow, where, after the usual curriculum of Latin, Greek, and Logic, he attended the lectures of Professor Reid, at that time in high metaphysical reputation, and formed an intimacy

with Dugald Stewart, which continued to the end of his life. Having been so fortunate as to obtain one of those exhibitions to Baliol College of which the university of Glasgow possesses the patronage, Archibald Alison removed to Oxford, where he completed his course of study, and took the degree of A.M., and afterwards of LL.B. In 1784 he also took orders, and married the eldest daughter of the celebrated Dr. John Gregory of Edinburgh. His first appointment in the church was to the curacy of Brancepath, in the county of Durham. After this, he was appointed to the chapelry of Kenley in Shropshire in 1790, and to the vicarage of Ercall in the same county in 1794, by the Earl of Darlington, to whom the patronage of both livings belonged; and in 1797 he was presented to Roddington by the lord-chancellor. In 1791 also, the small prebend of Yatminster Secunda, in the cathedral of Salisbury, was conferred upon him by Bishop Douglas. So many pluralities have an imposing appearance; but their aggregate revenue amounted to nothing more than £800 per annum. Circumstances soon led to Alison's removal to his native city, having been invited by Sir William Forbes and the vestry of the Episcopal chapel in the Cowgate of Edinburgh, to become senior minister of that charge. He removed to Edinburgh in 1800, and continued to preach in the Cowgate, until the congregation removed from that murky locality to the handsome chapel of St. Paul's, in York Place. In 1831 Alison, now an old man, and subject to severe attacks of pectoral disease, was obliged to desist from his public labours, and confine himself to the private society of his friends, in which the evening of his days was tranquil and happy. The high reputation which he had attained both as a preacher and writer, and his amiable personal qualities, endeared him to the most distinguished literary characters for which Edinburgh was now at the height of its fame; and he was in constant intercourse, among others, with Dugald Stewart, Dr. Gregory, Lord Woodhouselee, Professor Playfair, Dr. Thomas Brown, Sir James Hall, and Thomas Campbell. Besides these, he had been in familiar acquaintanceship with the illustrious of the end of the last century, such as Dr. Adam Smith, Dr. Adam Ferguson, Dr. Robertson, and Dr. Blair. He was indeed the literary Nestor of the day, who chronicled the remembrances of the great and good of a past generation for the instruction of their successors. Another congenial spirit, though in a different walk of intellect, whose society he especially valued, was Mr. Telford, the celebrated engineer; and it was pleasing to witness the zeal of the venerable pair, while Telford unfolded his scientific plans for the improvement of their native Scotland and its fair capital. The death of Archibald Alison occurred in 1839, at the age of eighty-two. By his wife, who died in 1830, he had six children, of whom three survived him, and one of them, Sir Archibald Alison, is known to most of our readers as the author of the *History of Europe from the French Revolution*.

Of the Rev. Archibald Alison's life as an author it is now necessary to speak. His *Essays on the Nature and Principles of Taste*, the work by which he is best known, was published so early as 1790, but attracted little notice. Not discouraged by the cold reception of a subject which had formed the chief study of his life, Alison, after he had been for some years settled in Edinburgh, republished his *Essays* with considerable additions in 1811. He had now won for himself a more favourable class of readers; and he was so fortunate as to find a eulogist in Francis Jeffrey, then the Aristarchus of critics,

and through the *Edinburgh Review*, at that time the paramount oracle of the literary world. A very powerful and beautiful article forthwith appeared in that periodical upon the long-neglected work; and the consequence was that the *Essays* immediately took their place as the standard of the *Nature and Principles of Taste*. The present generation can well remember how their boyhood and youth were familiarized with it, and how the pulpit and the press did homage to its authority. But time has sobered down this enthusiasm, and Alison is reckoned neither to have invented a new theory (for its leading idea had been distinctly announced by David Hume); nor to have sifted it with the most philosophical analysis, or expressed it in the happiest language. But who shall arrest our fleeting emotions produced by the sublime and the beautiful, and reduce them to such a fixed standard as all shall recognize? Longinus, Burke, Schlegel, and Alison have all successively passed away, while the science of æsthetics is still accumulating its materials for future theorists and fresh legislation. The theory of taste, like that of the weather or the tides, is still the subject of hypothesis and conjecture. Besides his principal work of *Essays on Taste*, which has gone through many editions, both in Britain and America, as well as been translated into French, Mr. Alison published two volumes of sermons, which have also been several times republished; and a "Memoir of Lord Woodhouselee," inserted in the *Transactions of the Edinburgh Royal Society*, 1818. The character of Alison, which is thus given by his son, was borne out through a long and well-spent life:—"No man who held firm and uncompromising opinions on the principles of religion and morals, looked with more indulgence on the failings of others, or passed through the world in more perfect charity and good-will to all men. No man who had lived much in society, could retire with more sincere pleasure at all periods of his life into domestic privacy, and into the solitude of the country. . . . No man who had attained a high reputation as a preacher or an author, was ever more absolutely indifferent to popular applause, as compared with the consciousness of the performance of duty."

ALLAN, DAVID, a painter of great merit, was born at Alloa, February 13th, 1744. He was the son of Mr. David Allan, shore-master at that small port. The mother of Allan, whose maiden name was Gullan, brought him prematurely into the world, and died a few days after his birth. The young painter had so small a mouth that no nurse could be found in the place fitted to give him suck: at length, one being heard of, who lived at the distance of some miles, he was packed up in a basket amidst cotton, and sent off under the charge of a man who carried him on horseback, the journey being rendered additionally dangerous by a deep snow. The horse happened to stumble, the man fell off, and the tiny babe was ejected from the basket into the snow, receiving as he fell a severe cut upon his head. Such were the circumstances under which Mr. David Allan commenced existence. Even after having experienced the tender cares of his nurse, misfortune continued to harass him. In the autumn of 1745, when he must have been about eighteen months old, a battery was erected at Alloa, to defend the passage of the Forth against the army of Prince Charles. While the men were firing the cannon for experiment, the maid intrusted with the charge of young Allan ran across the open space in front, at the moment when they were discharged, and he only escaped death by a hair-breadth.

His genius for designing was first developed by accident. Being confined at home with a burned foot, his father one day said to him, "You idle little rogue, you are kept from school doing nothing! come, here is a bit of chalk, draw something with it upon the floor." He took the chalk, and began to delineate figures of houses, animals, and other familiar objects; in all of which he succeeded so well that the chalk was seldom afterwards out of his hand. When he was about ten years of age, his pedagogue happened to exercise his authority over some of the boys in a rather ludicrous manner: Allan immediately drew a caricature of the transaction upon a slate, and handed it about for the amusement of his companions. The master of the ferule, an old vain conceited person, who used to strut about the school dressed in a tartan night-cap and long tartan gown, got hold of the picture, and right soon detected that he himself was the most conspicuous and the most ridiculous figure. The satire was so keen, and the laugh which it excited sunk so deep, that the object of it was not satisfied till he had made a complaint to old Allan, and had the boy taken from his school. When questioned by his father how he had the effrontery to insult his master, by representing him so ridiculously on his slate, his answer was, "I only made it *like* him, and it was all for fun!"

The father observed the decided genius of his son, and had the good sense to offer it no resistance. At this time the establishment of the Messrs. Foulis' academy of arts at Glasgow was making some noise in the country. Allan, therefore, resolved to apprentice his son to those gentlemen upon the terms given out in their prospectus of the institution. On the 25th of February, 1755, when exactly eleven years of age, the young draughtsman was bound apprentice to the Messrs. Foulis for seven years, to attend their painting academy in the university of Glasgow. In Newhall House there is a sketch in oil, done by him, representing the inside of the academy, with an exact portrait of Robert Foulis in the act of criticizing a large picture, and giving instructions to his principal painter about it.

In the year 1764 some of his performances attracted the notice of Lord Cathcart, whose seat, Shaw Park, was situated in Clackmannanshire near Alloa. Lady Cathcart introduced him to the notice of Lady Frances Erskine, daughter of the insurgent Earl of Mar, and mother of the gentleman to whom the peerage was restored in 1824; as also to Lady Charlotte Erskine, to Mrs. Abercromby of Tullibody, mother of Sir Ralph; and to some other personages of distinction in the neighbourhood of his birth-place. By the associated purses of these kind patrons, Allan was enabled to go to Italy, where he studied with unremitting application for eleven years. During his residence there, Lady Cathcart used to write to him with all the care and affection of a mother. In 1773, while living at Rome, he gained the prize medal given by the academy of St. Luke for the best specimen of historical composition; being the only Scotchman who had ever reached that honour, besides Mr. Gavin Hamilton.

After his return in 1777, Allan resided for about two years in London; but, falling into a bad state of health, he was ordered home to Scotland for a change of air. Soon after his arrival in Edinburgh, he was appointed successor to Runciman (deceased), as master and director of the academy established by the Board of Trustees for Manufactures and Improvements, for the purpose of diffusing a knowledge of the principles of the fine arts and elegance of design, in the various manufactures and works which required to be figured and ornamented; a charge for

which he was peculiarly well qualified, by the extensive knowledge he possessed of every branch of the art. He retained the situation till his death.

Allan was much admired for his talents in composition, the truth with which he delineated nature, and the characteristic humour which distinguished his pictures, drawings, and etchings. There are several engravings from his pictures, as, "The Origin of Painting, or the Corinthian Maid Drawing the Shadow of her Lover," and four in aquatinta by Paul Sandby, from drawings made by Allan when at Rome, representing the sports during the carnival. Several of the figures were portraits of persons well known to the English who visited Rome between 1770 and 1780. There is one caricature by Allan, which is well known to Scottish collectors: it represents the interior of a church or meeting-house at Dunfermline, at the moment when an imprudent couple are rebuked by the clergyman. There is a drollery about the whole of this performance that never fails to amuse. The alliance of his genius to that of our national poets, led Allan, in 1788, to publish an edition of the *Gentle Shepherd*, with characteristic drawings. He also published a collection of the most humorous of the old Scottish songs, each illustrated by a characteristic etching. At his death, which happened on the 6th of August, 1796, he left a series of drawings designed for the poems of Burns in an equally graphic and humorous style. There is one property which runs through all the designs of Allan, and by which his productions may be distinguished at the most casual glance: this is a peculiar elegance of form which he always gives to the limbs of his figures—elegance to such a degree, that in many cases it may be pronounced out of nature.

Allan, by his wife, whom he married in 1788, left one son, bearing his own name, and who was sent out as a cadet to India, and one daughter named Barbara. In person, our Scottish Hogarth, as he was called, had nothing attractive. The misfortunes attending his entrance into the world were such as nothing in after-life could repair. "His figure was a bad resemblance of his humorous precursor of the English metropolis. He was under the middle size; of a slender, feeble make, with a long, sharp, lean, white, coarse face, much pitted by the small-pox, and fair hair. His large prominent eyes, of a light colour, were weak, near-sighted, and not very animated. His nose was long and high, his mouth wide, and both ill-shaped. His whole exterior to strangers appeared unengaging, trifling, and mean; and his deportment was timid and obsequious. The prejudices naturally excited by these disadvantages at introduction, were however dispelled on acquaintance; and, as he became easy and pleased, gradually yielded to agreeable sensations; till they insensibly vanished, and at last, were not only overlooked, but, from the effect of contrast, even heightened the attractions by which they were so unexpectedly followed. When in company he esteemed, and which suited his taste, as restraint wore off, his eye imperceptibly became active, bright, and penetrating; his manner and address quick, lively, and interesting—always kind, polite, and respectful; his conversation open and gay, humorous without satire, and playfully replete with benevolence, observation, and anecdote."—*Brown's edition of the Gentle Shepherd*, 1808.

The author who thus forcibly delineates his external appearance, gives the following character of his genius:—"As a painter, at least in his own country, he neither excelled in drawing, composition, colouring, nor effect. Like Hogarth, too, beauty,

grace, and grandeur of individual outline and form, or of style, constitute no part of his merit. He was no Correggio, Raphael, or Michael Angelo. He painted portraits as well as Hogarth, below the middle size; but they are void of all charms of elegance, and of the claro-obscuro, and are recommended by nothing but a strong homely resemblance. As an artist and a man of genius, his characteristic talent lay in *expression*, in the imitation of nature with truth and humour, especially in the representation of ludicrous scenes in low life. His eye was ever on the watch for every eccentric figure, every motley group, or ridiculous incident, out of which his pencil or his needle could draw innocent entertainment and mirth."

ALLAN, GEORGE. This poet and professional litterateur, whose life unfortunately was too brief to develop into full maturity the high promise which his early efforts had given, was the youngest son of John Allan, farmer at Paradykes, near Edinburgh. Having adopted the law for his future profession, he became apprentice to a writer to the signet; but either growing weary of dry legal studies, or finding greater attractions in literature, he abandoned the vocation almost as soon as he had added W.S. to his name, and went to London for the purpose of pursuing an adventurous career as an author. There he soon obtained the acquaintance of Allan Cunningham, and Mr. and Mrs. S. C. Hall, who recognized his talents, and encouraged his literary aspirations. But his strength of nerve and soundness of health did not correspond with his ardent enthusiasm, so that in 1829 he was fain to accept an appointment in Jamaica. The climate of the West Indies not suiting him, he returned home in the following year, and soon after obtained the editorship of the *Dumfries Journal*, a respectable newspaper in the Conservative interests. This situation he continued to hold for three years with great popularity and success, when a change in the proprietorship of the newspaper introduced new measures and a new editor; and Allan repaired to Edinburgh, and obtained employment as literary assistant in the office of the Messrs. Chambers. In this situation, while he remained in it, he was comfortable and happy, while his intellectual energies had full swing; and besides contributing many excellent articles to Chambers' *Edinburgh Journal*, he wrote extensively in the columns of the *Scotsman* newspaper. Mr. Allan was also author of a *Life of Sir Walter Scott*, in one octavo volume, which enjoyed large popularity until it, with its other brethren, was swallowed up by the admirable memoir written by Lockhart; and he materially assisted Mr. Peter Macleod in preparing the *Original National Melodies of Scotland*, to which he furnished several contributions.

Although still young, Mr. Allan had already accomplished so much, and established so hopeful a prospect for the future, that in October, 1831, and while only in his 25th year, he ventured on "giving hostages to fortune," by marrying Mrs. Mary Hill, a widow, the eldest daughter of Mr. William Pagan of Curriestanes, and niece of Allan Cunningham. In 1834 also, some of his relatives, through political influence, obtained for him a situation in the stamp-office, which insured him a moderate competence, but without depriving him of opportunity to prosecute his literary occupations. But soon after this promising point was reached, his career was suddenly terminated. His intellectual and poetical ardour had been too much for the frame it tenanted; the delicate nervous organization, which had both animated and enfeebled him,

sank under the too close application of his mind; and he died suddenly at Janefield, near Leith, on the 15th of August, 1835, in the thirtieth year of his age, leaving behind him a name, both as a prose writer and a poet, which few so young are fortunate to establish.

ALLAN, ROBERT. This minor poet, whose merits however deserve commemoration, was, like most of his order, of a humble origin, being the son of a flax-dresser in Kilbarchan, Renfrewshire. He was born in that village on the 4th November, 1774, and was the third of a family of ten children. He followed the occupation of a muslin weaver; but having been born a poet, he relieved his monotonous occupation with poetry, so that many of his best compositions were produced under the regular clicking of his hand-loom. Through his early love of music and talent for song-writing he became acquainted with the poet Tannahill, and lived with him on terms of friendly intimacy. When the *Scottish Minstrel* was published by R. A. Smith, that eminent composer set the contributions of Robert Allan to music; and in 1820 several of Allan's songs were published in the *Harp of Renfrewshire*, where they attracted considerable notice. His popularity as a writer of songs was now so well established, that his friends thought the time had arrived when his reputation as a poet might be confirmed, and the poverty of his lot amended, by a separate publication of his own. Accordingly, a collection of his poems, revised by the editorial care of Robert Burns Hardy, teacher of elocution in Glasgow, was published by subscription in 1836; and—unmeritedly, as we think—proved a failure. This sufficed to deter him from any such attempt in future.

In the meantime, although depressed by poverty, Robert Allan had married, and was the father of a numerous family, all of whom were married except his youngest son, a portrait-painter of great promise, who had emigrated to the United States. Embittered by the neglect with which his poetry had been treated, and sick of his native country because it was not governed according to his own political theories, our poet, now in his sixty-seventh year, resolved to leave Scotland for ever, and spend the rest of his days with his youthful Benjamin in America. Greatly against the wish of his friends, he sailed to New York; but the fatigues of the voyage were too much for him, and he died in that city on the 1st of June, 1841, only six days after landing.

ALLAN, SIR WILLIAM, R.A., President of the Royal Scottish Academy of Painting. This distinguished painter was born at Edinburgh, in the year 1782, and was the son of William Allan, who held the humble office of macer in the Court of Session. Notwithstanding the circumstances of his birth, he was destined, like others of the same grade in Scotland, to undergo a classical education, before his future path in life was selected. Accordingly, he was sent to the high-school of Edinburgh, and placed under the preceptorship of Mr. William Nicol, whose memory will descend to posterity more for the "peck o' maut" which he brewed to supply one memorable sitting where Burns was the laureate, than for all his classical attainments, respectable though they were. The future artist, however, was a poor Latin scholar, though Nicol was a stern and able teacher. In fact, the boy already felt nature strong within him, so that he was sketching the objects around him with whatever instrument came to hand, while his class-fellows were occupied with the commentaries of Cæsar or the longs and shorts of

Ovid. So keen was this artistic tendency, that the forms and floor of the class-room were frequently chalked with his juvenile efforts, while their excellence pointed out the offender who had thus transgressed against academic rule. Another luxury in which he indulged, was to linger near a group of boys playing at marbles; and while studying their attitudes and the expression of their countenances, he neither thought of the class hour that had elapsed, nor the punishment that awaited his remissness. After striving against the bent, Mr. Nicol saw that he could not transform his pupil into a lover of Latin and Greek; but his pupil had long been of the same opinion. He felt within himself not only his natural tendency, but a vague conception of the eminence to which it would lead him; and his usual reply to paternal remonstrance was, "Father, in spite of all this spending of money in learning Latin, I will be a painter." A painter accordingly it was consented that he should be, but his novice in the profession was sufficiently humble: he was bound apprentice to a coach-builder in Leith Walk, to paint the armorial bearings on the panels of carriages. But Hogarth himself had a less promising commencement. William Allan, although a stripling not more than thirteen years of age, soon gave such indications of pictorial excellence, that he was employed in the delicate task of painting certain anatomical preparations at Surgeons' Square Hall. At the commencement of his labours there, he was locked up by mistake at night in the room where he had been occupied all day, and was thus compelled to spend the hours of darkness amidst the skeletons and mangled relics of the dead. The hideous effects upon the imagination of a timid susceptible boy in such a charnel-house; the sights he saw by the glimmer of the moon through the crevices of the window-shutters, and the still more terrible phantasms which his fancy conjured up, formed such a night of horror as no artist but Fuseli could have relished. Allan himself was wont at a late stage in life, and amidst the literary circles of Edinburgh, to detail the particulars of this ghastly bivouac with a force of description and amount of merriment that never failed to set the hearers in a roar. It was making Yorick's skull to speak anew, for the mirth of the present generation.

The high promise of excellence which the coach-panel painting of William Allan afforded, so won upon his employer, that, through the influence of the latter, he was entered in the Trustees' Academy, where he was a pupil for several years; and it is worthy of remark that Wilkie entered this school at the same period with Allan, sat on the same form, and copied from the same models and drawings. This circumstance, independently of their mutual enthusiasm for the art in which they were afterwards so distinguished, ripened an affection between them which no jealous rivalry could subsequently disturb. Their friendship continued unabated till the close of Wilkie's life; and Allan was wont, while training his scholars, to refer to his illustrious fellow-pupil, as their best model and example. After he had spent several years in the lessons of the Trustees' Academy, where he had a faithful and efficient teacher in Mr. Graham, of whose instructions he always spoke with gratitude and respect, Allan went to London, and was admitted to the school of the Royal Academy. On commencing active life, however, he soon experienced the difficulties with which the fine arts, as a profession, have to contend in the great metropolis of merchandise: his superiority was not felt with that readiness which his youthful enthusiasm had anticipated, and the demands upon his

pencil were so few as would soon have been insufficient to furnish him with a mere subsistence. Like his countrymen so situated, he resolved to try the experiment elsewhere, and find or make a home wherever his talents could be best appreciated. The place he selected for trial was Russia, a country still imperfectly known in general society, and where the fine arts seemed to have little chance of a cordial reception, amidst the recent and as yet imperfect civilization of the people. The boldness of his choice was also fully matched by scantiness of means for its execution; for he knew nothing of the Russian language, was slenderly provided with money, and had only one or two letters of introduction to some of his countrymen in St. Petersburg.

Thus inadequately equipped, the artist-adventurer threw himself into a career which was ultimately to lead to fame and fortune. Even the commencement was attended with a startling omen; for the ship in which he embarked for Riga was tossed about by adverse winds, and at length driven almost a wreck into Memel. Thus, contrary to his purpose, Allan found himself the temporary inhabitant of a sea-port town in Prussia, in the midst of a people to whose tongue he was a stranger, and with pecuniary resources which a few days would exhaust. Still, however, his stout heart triumphed over the difficulty. Having settled himself at an inn, he commenced in due form the occupation of portrait painter, and had for his first sitter the Danish consul, to whom he had been introduced by the captain of the vessel that brought him to Memel. Other sitters followed; and having thus recruited his exhausted purse, he resumed his original purpose of travelling to Russia, which he did by land, passing, on his way to St. Petersburg, through a considerable part of the Russian army, which was at that time on its march to the field of Austerlitz. At St. Petersburg he found an effectual patron in his countryman, Sir Alexander Crichton, physician to the imperial family, to whom he was warmly recommended by Colonel Crichton, the physician's brother, one of his early patrons in Scotland, and by Sir Alexander he was introduced to an extensive and fashionable circle of society, where his artistic talents were appreciated, and his opportunities for their improvement furthered. To accomplish that improvement, indeed, was so strongly the desire of his ardent enthusiastic mind, that neither the motives of personal comfort and safety, nor the attractive society of the Russian capital, could withhold him from a course of adventurous self-denying travel. He therefore repaired to the Ukraine, where he resided for several years, studying the wild scenery of the steppes, and the still wilder costume and manners of its inhabitants, with a fearless and observant eye. He also made occasional journeys to Turkey and Tartary, as well as to the remote dependencies of the Russian empire, dwelling in the hut of the barbarian serf, or the tent of the wandering nomade, as well as the palace of the boyar and the emir; and amidst the picturesque tribes of the east and north, with whom he thus freely fraternized, he enjoyed a daily intercourse with those whom his less adventurous brethren at home are contented to delineate from the narratives of the traveller or the waking dreams of the studio. The large collection which Allan made of the dresses, armour, weapons, and utensils of the various communities among whom he sojourned, and the life-like ease and fidelity of form, feature, and costume, by which the figures of his principal paintings are distinguished, attest how carefully and how completely he had identified himself with Russian, Turk, and Pole, with Cossack, Circassian, and Bashkir. It is much to be regretted

that he kept no journal of the many stirring scenes he witnessed, and the strange adventures he underwent in this novel pilgrimage in quest of the sublime and the beautiful. That they were pregnant with interest and instruction, and worthy of a permanent record, was well evinced by the delight with which his hearers were wont to listen to his conversational narratives, when he happened—which was but rarely—to allude to the events of his travels. He appears also to have become an especial favourite with those rude children of the mountain and the desert among whom he sojourned, and whose language, dress, and manners he adopted, so that he is still remembered by the old among them as an adopted son or brother, while in Poland the usual name by which he is distinguished is *le Raphaël Ecossais*—the Scottish Raphael.

After this romantic apprenticeship, in which he established for himself a high reputation as a painter among foreigners, while he was still unknown at home, Allan resolved, in 1812, to return to his native land. But the invasion of Russia by Napoleon obliged him to postpone his purpose; and in addition to the large stock of ideas which he had already accumulated for future delineation, he was compelled to witness, and treasure up remembrances of, the worst effects of war upon its grandest scale—bloodshed, conflagration, and famine maddening every human passion and feeling to the uttermost. On the restoration of peace in 1814, Allan returned to Edinburgh after a ten years' absence, and commenced in earnest the work for which he had undergone so singular a training. His first effort, which was finished in 1815, and exhibited in Somerset House, was his well-known painting of the "Circassian Captives;" and after this followed the "Tartar Banditti," "Haslan Gherai crossing the Kuban," "A Jewish Wedding in Poland," and "Prisoners conveyed to Siberia by Cossacks." But, notwithstanding the now highly established reputation of these and other productions, which he exhibited in his native city, along with the costumes and weapons of the countries by which his paintings were illustrated, a home reputation was very hard to establish: his countrymen, with their proverbial caution, were slow to perceive the excellences that addressed them in such an unwonted form, and refused to sympathize, at first sight, with Poles, Tartars, and Circassians. It was well, therefore, for Allan that his labours had already been prized in Russia, so that he had not been allowed to return home empty-handed. He persevered with the same boldness that had carried him onward through the encampments of the Calmucks or the defiles of the Caucasus; and to all the remonstrances of his relations, who advised him to leave such unprofitable work and betake himself to portraits, by which he would gain both fame and money, his invariable answer was, "I will be a historical painter." His perseverance was at last rewarded. Sir Walter Scott, John Lockhart, and John Wilson, with others, who were able to appreciate the artist's merits, combined to purchase the "Circassian Captives" at a price adequate to its value; and having done this, the individual possession of the painting was decided among them by lot, in consequence of which it became the property of the Earl of Wemyss. "Haslan Gherai" and the "Siberian Exiles" also found a munificent purchaser in the Grand Duke Nicholas, late Emperor of Russia, when he visited the Scottish capital. The tide had thus changed; and it bore him on to fortune, not only in pecuniary matters, but to what he had still more at heart—the establishment of his reputation as a Scottish painter

of history. Although they are so well known, the following list of his principal productions may here be fitly introduced:—

THE SLAVE MARKET AT CONSTANTINOPLE—purchased by Alexander Hill, Esq., and now the property of Miss Davidson of Durievale, Fife.

JOHN KNOX ADMONISHING MARY QUEEN OF SCOTS.—This is the well-known scene described by the Reformer himself, in which the beautiful queen, irritated by his bold sentiments about the limited power of sovereigns, and the liberty of their subjects, burst into tears.

THE ORPHAN, a scene at Abbotsford, in the interior of Sir Walter Scott's breakfast-room.

THE MEETING OF DAVID DEANS WITH HIS DAUGHTER JEANIE AT ROSENEATH. In the tale of the *Heart of Mid-Lothian*, Sir Walter Scott, after describing the dress, look, and attitude of the stern old father, adds, "So happily did they assort together, that, should I ever again see my friends Wilkie or Allan, I will try to borrow or steal from them a sketch of this very scene." This was a fair challenge, which Allan gladly accepted, and the picture of the meeting at Roseneath was the result.

THE REGENT MURRAY SHOT BY HAMILTON OF BOTHWELLHAUGH.—In this great event of Scottish history, the painter, instead of confining himself to the strict historical record, has adopted the poetical description of Sir Walter Scott in his ballad of *Cadsoo*. This gave the artist an opportunity of introducing several personages who were not present at the scene, such as John Knox and the Earl of Morton.

THE MURDER OF DAVID RIZZIO.

THE FAIR MAID OF PERTH.—The scene is that in the glover's house, when Henry of the Wynd was suddenly awoke on Valentine's morn by the bashful salute of the fair object of his affections, according to the established custom of the festival.

THE BATTLE OF PRESTONPANS.—The central and chief object in this painting is the death of Colonel Gardiner, amidst the small handful of English infantry whom he joined when his cavalry had deserted him.

THE ETRICK SHEPHERD'S BIRTHDAY.—In this painting, the portraits of the principal friends of the artist and poet are introduced within the interior of Hogg's house at Eltrive, after a day spent in trouting and rambling among the mountains.

THE DEATH OF ARCHBISHOP SHARPE.

A PRESS-GANG.—The terrible and heart-rending fidelity and power of this delineation have always placed it in the foremost rank of Allan's artistic productions. A young man, the son of a fisherman, has just returned from a long voyage in a merchant ship, and been welcomed by his parents, relatives, and mistress: the triumphant feast is prepared, and the happiness of the party has reached its height, when a press-gang suddenly rushes in, and the sailor-boy is within their grasp, and about to be carried off. The agony of the parents; the fruitless attempt of the mother to bribe the leader of the gang; the stupor of the aged grandfather and grandmother, with whom this seems to be the last, as well as the most crushing affliction which a long-spent and now worn-out life could have in store for them—and saddest of all, the half-dressed maiden who has hurried to welcome her lover's return, but only to lose him, and who has fallen into an insensibility that might be mistaken for death—compose a group of misery which art has seldom equalled, and perhaps never surpassed.

These are but a few of Allan's many productions, which were prized by competent judges as master-

pieces of historical painting, and the greater part of which have been familiarized to the public at large through the medium of engraving. His labours, however, were more than once interrupted from ill health; and at last, a complaint in the eyes suspended his exertions for several years, and threatened to end in total blindness. By medical advice he went to Italy; and after sojourning a winter at Rome, and spending a short time in Naples, he visited Constantinople, Asia Minor, and Greece, and returned with recruited health to his beloved studio in Edinburgh. He became once more a traveller in 1834, being desirous of visiting the romantic and historical scenery of Spain. His journey on this occasion extended into Western Barbary, and would have been still further lengthened, but for a sudden necessity of returning home, after which he continued to produce many of his best paintings. A desire also to paint the battle of Waterloo led him several times to France and Belgium, that he might collect sufficient materials in costume, scenery, and incident, and study accurately the field of conflict. The result was a magnificent view of this great combat of nations, which, at the exhibition of the Royal Academy in 1843, was purchased by the Duke of Wellington, who testified his approbation of its truth and accuracy. Allan had now done enough for fame and fortune, both as artist and traveller; but in 1844 he again grasped his pilgrim's staff for a journey into the far north. He visited Russia, and there produced his painting of "Peter the Great teaching his subjects the art of Ship-building;" which, after being exhibited in the Royal Academy in 1845, was purchased by the Emperor of Russia, for the winter palace of St. Petersburg. In consequence of the success of his first painting of Waterloo, he resolved on producing a second; and, as the former was delineated as viewed from the French side of the action, the latter was from the British. Independently also of the stirring nature of the subject, his personal as well as patriotic feelings were engaged in this fresh effort, for it was intended for the competition of Westminster Hall in 1846. Great, however, as were its merits, it was unsuccessful. It was afterwards purchased by the Junior United Service Club in London, of whose splendid rooms it now forms a conspicuous ornament. The public honours which had already rewarded him, might indeed sufficiently console him under this disappointment; for in 1826 he was elected an associate of the Royal Academy, and in 1835 an academican. Four years later, on the death of Watson, he was unanimously preferred to the office of president of the Royal Scottish Academy; and in 1842, after having been appointed her majesty's limner for Scotland on the death of Wilkie, he received the honour of knighthood. He was now also the venerable father of Scottish painting, and could look around him with pleasure upon a race of promising artists whose genius his example and labours had kindled in a department which, as yet, his countrymen had almost wholly neglected.

The last professional labour in which Sir William Allan was engaged was the "Battle of Bannockburn," into the difficult and complicated details of which he entered with all the inspiration and vigour of his best days. The period of action selected was the critical moment when the English, daunted by the discomfiture of their bowmen, the overthrow of their splendid cavalry among the concealed pits, and the appearance of what seemed a fresh Scottish army descending from the Gillie's Hill, gave way on every side, and were pressed and borne down by the resistless effort of the four Scottish bodies, now united

into one, with the heroic Bruce at their head. But this painting, to which he clung to the last, and touched and retouched with a dying hand, he did not live to finish. He died at his house in Great King Street, Edinburgh, on February 23, 1850. As a painter, Sir William Allan will long be gratefully remembered in the annals of Scottish art, for the impulse which he gave to historical composition. For this department he was eminently fitted; for his excellence in painting did not so much consist in character and colour, as in his admirable power in telling a story and his general skill in composition, by which each of his productions is a striking poetical narrative. Sir Walter Scott, a congenial spirit, who highly prized and affectionately loved him, was wont to speak of him under the familiar endearing name of "Willie Allan."

ALSTON, CHARLES, M.D., an eminent botanist, was born in 1683, in Lanarkshire, and spent his early years at Hamilton Palace, under the patronage of the Duchess of Hamilton. Her grace wished him to study the law, but he preferred botany and medicine, and accordingly, in 1716, set out for Leyden, where those sciences were at that time taught by the illustrious Boerhaave. Here he found a great number of young Scotsmen engaged in the same pursuit, and all inspired with an uncommon degree of enthusiasm in their studies, which they had caught from their master. Alston, after taking his degree as doctor of physic, returned to his native country, and began to practise in Edinburgh. He obtained the sinecure office of king's botanist, through the influence of the Duke of Hamilton, heritable keeper of Holyrood House, to which the garden was attached. This garden he enriched by large collections which he had made in Holland, where botanical science was then more highly cultivated than in any other country in Europe. In 1720, notwithstanding that a botanical class was taught in the college by a professor of eminence named Preston, he began a course of lectures in the king's garden. Preston at length waxing old, Alston was, in 1738, chosen to succeed him, as professor of botany and materia medica united. He was exceedingly laborious in his duties as a professor, giving a course on botany every summer, and one on materia medica every winter; and never sparing any pains which he thought could be conducive to the progress of his pupils. The celebrated Dr. Fothergill, in his character of Dr. Russell, bears ample testimony to the assiduity of Dr. Alston, who had been his master; and describes in glowing language the benefit which those who attended him had the means of reaping, his caution in speculation, and how laborious he was in experiment. For the assistance of his pupils, he published, about 1740, a list of the officinal plants cultivated in the Edinburgh medical garden. Of Linnæus's system, which was first promulgated in 1736, Dr. Alston, like many other philosophers of his day, was a steady opponent. He published a paper against it, on the sexes of plants, in the first volume of *Physical and Literary Essays*, a miscellany which was commenced at Edinburgh in 1751. The controversy which took place at that period amongst naturalists has now lost all its interest, seeing that the method of Linnæus, after serving a useful purpose, has been superseded by the natural system, to the foundation of which Linnæus in no small degree contributed, but which it was left to Jussieu and De Candolle to mature. Dr. Alston also contributed some articles to an Edinburgh miscellany entitled *Medical Essays*; the most important is one on opium. In 1753 he published an introduction to Dr. Patrick Blair's

Index Medicæ Medicæ, a work which resembled his own index in a considerable degree. This introduction was a separate work, and was entitled *Tyrocinium Botanicum Edinburgense*. Dr. Alston, as the contemporary of the first Monro, and professor of a kindred branch of science, was by no means unworthy of either his time or his place. He must be considered as one of those who have contributed to the exaltation of the college of Edinburgh as a school of medical science. He died on the 22d of November, 1760, in the seventy-seventh year of his age.

ANDERSON, ADAM, author of the largest British compilation upon commercial history, was a native of Scotland, born about the year 1692. Having removed to London, he was for forty years a clerk in the South Sea House, and at length was appointed chief clerk of the stock and new annuities in that establishment, in which situation he continued till his death. He was appointed one of the trustees for establishing the colony of Georgia, by charter dated June 9th, 5 Geo. II. He was also one of the court of assistants of the Scots corporation in London. In 1762 he published his work entitled *A Historical and Chronological Deduction of the Origin of Commerce, from the earliest accounts to the present time; containing a history of the large commercial interests of the British Empire, &c.*, London, 2 vols. folio. The elaborate character of this work says much for the industry of the author. It was subsequently improved in a new edition by David Macpherson, 4 vols. quarto; and a manual abridgment of the work may still be considered a want in our literature. Mr. Anderson died soon after he had given it to the world, January 10th, 1765, at the age of seventy-three.

ANDERSON, ALEXANDER, a very eminent mathematician, born at Aberdeen, near the close of the sixteenth century. How or where he acquired his mathematical education is not known; he probably studied *belles-lettres* and philosophy in his native university. He comes into notice at Paris, early in the seventeenth century, as a private teacher or professor of mathematics. In that city, between the years 1612 and 1619, he published or edited various geometrical and algebraical tracts, which are conspicuous for their ingenuity and elegance. It is doubtful whether he was ever acquainted with the famous Vieta, master of requests at Paris, who died in 1603; but his pure taste and skill in mathematical investigation pointed him out to the executors of that illustrious man—who had found leisure, in the intervals of a laborious profession, to cultivate and extend the ancient geometry, and by adopting a system of general symbols, to lay the foundation, and begin the superstructure of algebraical science—as the person most proper for revising and publishing his valuable manuscripts. Anderson, however, did not confine himself to the duty of a mere editor; he enriched the text with learned comments, and gave neat demonstrations of those propositions which had been left imperfect. He afterwards produced a specimen of the application of geometrical analysis, which is distinguished by its clearness and classic elegance.

The works of this eminent person amount to six thin quarto volumes, now very scarce. These are—1. *Supplementum Apollonii Redivivi: sive analysis problematis hactenus desiderati ad Apollonii Pergæi doctrinam præ veterum a Marino Ghetaldo Patrio Regusino hujusque non ita pridem institutam*, &c.: Paris, 1612, 4to. This tract refers to the problem of inclinations, by which, in certain cases, the appli-

cation of the curve called the *conchoid* is superseded. 2. *Αυτολογία: Pro Zetico Apolloniani problematis a se jam pridem edito in supplemento Apollonii Redivivi*. Being an addition to the former work: Paris, 1615, 4to. 3. The edition of the works of Vieta: Paris, 1615, 4to. 4. *Ad Angularum Sectionem Analytica Theoremata καθολικότερα*, &c.: Paris, 1615, 4to. 5. *Vindiciae Archimedis*, &c.: Paris, 1616, 4to. 6. *Alexandri Andersoni Scoti Exercitationum Mathematicarum Decas Prima*, &c.: Paris, 1619, 4to. All these pieces of this excellent geometrician are replete with the finest specimens of pure geometrical exercises that have ever perhaps been produced by any authors, ancient or modern. Besides these, literary history is not aware of any other publications by Anderson, though probably there may have been others. Indeed, from the last piece it fully appears that he had at least written, if not published, another, viz. *A Treatise on the Mensuration of Solids*, perhaps with a reference to gauging; as in several problems, where he critically examines the treatise of Kepler on cask-gauging, he often refers to his own work on stereometry.

The subject of this memoir was cousin-german to Mr. David Anderson, of Finshaugh, a gentleman who also possessed a singular turn for mathematical knowledge, and who could apply his acquirements to so many useful purposes that he was popularly known at Aberdeen by the name of Davie Do-a-things. He acquired prodigious local fame by removing a large rock which had formerly obstructed the entrance to the harbour of Aberdeen. Mathematical genius seems to have been in some degree inherent in the whole family; for, through a daughter of Mr. David Anderson, it reached the celebrated James Gregory, inventor of the reflecting telescope, who was the son of that lady, and is said to have received from her the elements of mathematical knowledge. From the same lady was descended the late Dr. Reid of Glasgow, who was not less eminent for his acquaintance with the mathematics than for his metaphysical writings.

ANDERSON, CHRISTOPHER. This excellent divine, whose whole life was an uninterrupted career of conscientious painstaking activity and usefulness, was born in the West Bow, Edinburgh, on the 19th of February, 1782. Being intended for business, he was entered as junior clerk in a friendly insurance office; but at the early age of seventeen, having joined the religious body called Independents, and two years afterwards that of the English Baptists, he relinquished his profitable clerkship that he might devote himself to the ministerial office over that small community in Edinburgh who held his own religious doctrines. For this purpose he underwent a hasty course of study in the university of Edinburgh, which he completed with almost equal speed at the Baptist colleges of Olney and Bristol, where a twelvemonth's study of theology was alternated with the practice of preaching as an itinerating missionary; and having in this way qualified himself for the work he originally contemplated, he returned to Edinburgh and devoted himself to the little community that had waited his arrival. His commencement in the Scottish metropolis, where learned and eloquent ministers are so abundant and so highly prized, was as unpromising as his educational training: his usual audience in the small chapel he had hired for the occasion consisted of from fifty to seventy hearers, while the regular members of his flock amounted to fourteen or fifteen persons, and his call to be their minister exhibited the signatures of not more than thirteen names. So small a beginning, however, is no measure of the capacity

of dissenterism under the guidance of a popular preacher; and his congregation increased until the small chapel could not hold them, so that they were obliged to remove to a larger. And while thus successful, his labours were not confined to his own particular locality. He itinerated as an occasional missionary over several parts of the United Kingdom, bestowing not only his labours but his money in the establishment of a home mission in the Highlands; and in 1810 he originated the Edinburgh Bible Society, an institution that combined the clergy of Scotland of almost every denomination into one body of religious action.

The Rev. Christopher Anderson had now become a man of considerable note in Edinburgh; and it speaks much for his diligence and zeal that, notwithstanding his scanty education, he had been able to make way among the learned and accomplished, and become a leader among them in the field of Christian enterprise. But his natural capacities were excellent, while his course of action seemed the fittest school for maturing and improving them. Thus successful as a minister, it was natural that such a man should attempt the work of authorship; and for this an occasion was soon presented. During his itinerating missionary tours Ireland had fallen within his range; and from the experience which he acquired of that country during a considerable sojourn there in 1814, he was induced to publish *A Memorial in behalf of the Native Irish, with a view to their Improvement in Moral and Religious Knowledge through the medium of their own Language*. At first it was only a small pamphlet, but he afterwards expanded it into a duodecimo volume. Another such attempt was occasioned by his laying before the Edinburgh Bible Society, in 1819, a MS. entitled *A Memorial respecting the Diffusion of the Scriptures, particularly in the Celtic or Iberian Dialects*. His statements on this subject were judged so important that the society requested him to publish them; and on complying with their desire, the effect of this production was to increase the exertions for the diffusion of Irish and Gaelic Bibles beyond all former example. This work he afterwards enlarged under the title of *The Native Irish and their Descendants*. But besides thus directing the public attention to the religious wants of Ireland and the Highlands, Mr. Anderson's authorship was called to a subject of domestic and personal interest. His beloved wife had died: his family of two sons and three daughters had also passed successively away; and these afflictions, by which he was left alone in the world, had brought on not merely the appearance, but also the infirmities, of a premature old age. It was during these heavy successive calamities, and before the grave had finally closed upon every member of the family, that he sat down to console himself by the labours of his pen, and produced *The Domestic Constitution; or the Family Circle the Source and Test of National Stability*.

But the chief literary production of Mr. Anderson was *The Annals of the English Bible*; and, like his earlier attempts in authorship, it originated in accident, and was expanded by after-reflection. At the third centenary of Coverdale's translation of the Bible in 1835 he preached a sermon on the subject; and as he had bestowed much attention on it, his facts were so new and his views so important to many of his audience, that they requested him to publish the discourse. It was accordingly published under the title of *The English Scriptures, their first Reception and Effects, including Memorials of Tynedale, Frith, Coverdale, and Rogers*. The production was so favourably received by the public that he was re-

quested to reproduce it in a more ample form; and on assenting, he soon found that the task would require the study not merely of weeks but of years. Undismayed, however, by such a prospect, he addressed himself to the task; and from the years 1837 to 1845 his researches were prosecuted in the library of the British Museum, the Bodleian at Oxford, the university library and others at Cambridge, the Baptist Museum at Bristol, besides numerous private sources, from all of which he culled such information as filled several bulky volumes of note-books. But when the *Annals of the Bible* was published the public curiosity had abated, or been directed into new channels; and even those who felt most interest in the subject were dismayed at the voluminous dimensions in which it was presented to their notice. So far therefore as immediate success was concerned, the work was a literary failure; and no occasion has since occurred to revive it into popularity. But it is not the less a valuable production, from which, as from a store-house, the theologian can at once get those necessary materials which he would be compelled to seek over a wide and difficult field of investigation. After a life of such active usefulness as missionary, minister, founder and secretary of religious associations, correspondent with foreign missions, and author, the Rev. Christopher Anderson died at Edinburgh on the 18th of February, 1852, within a single day of completing the seventieth year of his age.

ANDERSON, JAMES, an eminent antiquary, was the son of the Rev. Patrick Anderson, who had been ejected for nonconformity at the Restoration, and who afterwards suffered imprisonment in the Bass for preaching in a conventicle at Edinburgh. The subject of this memoir was born in Edinburgh, August 5th, 1662, and in 1677 is found studying philosophy in the university of that city, where, after finishing a scholastic education, he obtained the degree of Master of Arts on the 27th of May, 1680. He chose the law for his profession, and, after serving an apprenticeship under Sir Hugh Paterson of Bannockburn, was admitted a member of the society of writers to the signet in 1691. In this branch of the legal profession the study of written antiquities in some measure forces itself upon the practitioner; and it appears that Anderson, though a diligent and able man of business, became in time too fond of the accessory employment to care much for the principal. A circumstance which occurred in 1704 decided his fate by tempting him into the field of antiquarian controversy. The question of the union of the two countries was then very keenly agitated—on the one side with much jealous assertion of the national independence—and on the other, with not only a contempt for the boasts of the Scots, but a revival of the old claims of England for a superiority or paramourcy over their country. A lawyer named Attwood in 1704 published a pamphlet in which all the exploded pretensions of Edward I. were brought prominently into view, and a direct dominion in the crown of England asserted over that of Scotland. For this work, Mr. Anderson, though altogether unknown to Mr. Attwood, was cited as an evidence and eye-witness to vouch some of the most important original charters and grants by the kings of Scotland, which Attwood maintained were in favour of the point he laboured to establish. Mr. Anderson, in consequence of such an appeal, thought himself bound in duty to his country to publish what he knew of the matter, and to vindicate some of the best of the Scottish kings, who were accused by Attwood of a base and voluntary surrender of their sovereignty. Accordingly, in 1705 he published *An Essay, showing that the Crown*

of Scotland is Imperial and Independent, Edinburgh, 8vo, which was so acceptable to his country, that, besides a reward, thanks were voted to him by parliament, to be delivered by the lord-chancellor, in presence of her majesty's high commissioner and the estates, at the same time that Attwood's book, like others of the same nature, was ordered to be burned at the cross of Edinburgh by the hands of the common hangman. Mr. Anderson's publication is now of little value, except for the charters attached to it in the shape of an appendix.

This affair was the crisis of Anderson's fate in life. He had, in the course of his researches for the essay, collected a large mass of national papers: the study of charters was just then beginning to be appreciated by antiquaries; the enthusiasm of the nation was favourable, for the moment, to any undertaking which would show the ancient respectability of its separate system of government. Under all these circumstances Anderson found it easy to secure the patronage of the Scottish estates towards a design for engraving and publishing a series of fac-similes of the royal charters previous to the reign of James I., and of seals, medals, and coins, from the earliest to the present time. In November, 1706, he had a parliamentary grant of £300 towards this object. He then proceeded vigorously with the work, and in March, 1707, had not only expended the £300 granted by parliament, but £590 besides, which he had drawn from his own funds. A committee reported the facts; and the estates, while they approved of his conduct, recommended to the queen to bestow upon him an additional contribution of £1050 sterling. Another parliamentary act of grace—and one of the very last proceedings of the Scottish estates—was to recommend him to the queen "as a person meriting her gracious favour, in conferring any office or trust upon him, as her majesty, in her royal wisdom, shall think fit."

Quite intoxicated with this success, Anderson now gave up his profession, and, resolving to devote himself entirely to the national service as an antiquary, removed to London, in order to superintend the progress of his work. The event only added another proof to what is already abundantly clear—that scarcely any prospects in the precarious fields of literature ought to tempt a man altogether to resign a professional means of subsistence. The money voted by the expiring parliament is said to have never been paid;—the British senate perhaps considering itself not the proper heir of the Scottish estates. Apparently in lieu of money, he was favoured, in 1715, with the appointment of post-master-general for Scotland; but of this he was deprived in little more than two years. What progress he now made with his great work is not very clearly known. He is found in 1718 advertising that those who might wish to encourage it "could see specimens at his house, above the post-office in Edinburgh." As the expense of engraving must have borne hard upon his diminished resources, he would appear to have digressed for some years into an employment of a kindred nature, attended with greater facilities of publication. In 1727 he published the two first volumes of his well-known *Collections relating to the History of Mary, Queen of Scotland*, Edinburgh, 4to, which was speedily completed by the addition of two other volumes. This work contains a large mass of valuable original documents connected with the Marian controversy; but George Chalmers, who went over the same ground, insinuates that there is too much reason to suspect his honesty as a transcriber. If the prejudices of the two men are fairly balanced against the reputations which they respectively bear

as antiquaries, we must acknowledge that the charge may not be altogether groundless.

Anderson died in 1728 of a stroke of apoplexy, leaving his great work unfinished. The plates were sold in 1729 by auction at £530, and it was not till 1737 that the work appeared, under the title of *Selectus Diplomatum et Numismatum Scotie The-saurus*, the whole being under the care of the celebrated Thomas Ruddiman, who added a most elaborate preface.

ANDERSON, JAMES, D.D., author of a large and useful work, entitled *Royal Genealogies*, was the brother of Adam Anderson, author of the *Commercial History*. He was for many years minister of the Scots Presbyterian church in Swallow Street, Piccadilly, and was well known among the people of that persuasion in London by the nickname of "Bishop Anderson." He was a learned but imprudent man, and lost a considerable part of his property by rash speculations in the South Sea scheme. His great work as an author was *Royal Genealogies, or the Genealogical Tables of Emperors, Kings, and Princes, from Adam (!) to these Times*, London, folio, 1732. The compilation of this huge work, in which he was aided by many eminent personages, whose families entered into its plan, cost him, according to his own account, the labour of seven years. It is certainly the completest work of the kind in existence, though with no pretensions to discrimination. The author says very frankly in his preface, that "he has avoided all terms and expressions that may give offence to any nation or family, to any person or party; having nothing to do with the national controversies of historians, nor with the ecclesiastical and religious debates of theologians, nor with the politics of statesmen, nor with the private jangles of the critics in a work of this kind, but only with facts and plain truth: so that he has let every nation enjoy its own faith; and if any find fault, he hopes they will readily excuse him, not having designed to offend them, and is willing to make satisfaction if he lives to publish a second edition." Dr. Anderson also wrote *The Constitutions of the Free Masons*, being the chaplain of that body in London. The dates of this worthy man's birth and death are not ascertained. He lived in a house opposite to St. James's Church, Piccadilly.

ANDERSON, JAMES, an agricultural and miscellaneous writer of great merit, was the son of a farmer at Hermiston, in the county of Mid-Lothian, where he was born in the year 1739. His father dying when he was very young, he was educated by his guardian to occupy the farm, which accordingly he began to manage at the early age of fifteen. It may be supposed that he could not have been entrusted with so important a charge if he had not already manifested symptoms of superior character and intellect; much less, without such qualifications, could he have discharged it, as he is said to have done, with approbation. In reading some agricultural works, to qualify himself for his duties, he had observed that it would be of advantage to study chemistry: he accordingly attended the lectures given in the university of Edinburgh by Dr. Cullen, who, although surprised that one so young should have formed this resolution, had soon reason to admire his pupil's laudable curiosity and good sense, and liberally afforded him every encouragement. To chemistry he added the study of certain collateral branches of science; so that, when he entered upon his farm, he was not only able to keep up with his more aged and experienced neighbours, but to adopt a number of improvements, which

were speedily found to be of a most profitable nature. Among his improvements was the introduction of the small two-horse plough, which since then has so completely banished the lumbering engine formerly drawn by a string of cattle. Nor did the necessary business of his farm preclude all advancement in knowledge. He still prosecuted his studies, and contrived to amass an immense stock of information upon almost all subjects.

His first attempts in literature appeared in "Essays on Planting," in Ruddiman's *Weekly Magazine* for 1771. In 1777, having previously removed to a large farm in Aberdeenshire, he published these essays in a separate volume. In 1776 appeared his *Essay on Chimneys*, in which the principle afterwards acted on in the patent Bath stove was first explained. In the same year with his volume on *Planting* appeared various pamphlets connected with rural economy, all of which were more or less calculated to gratify the increasing desire of his countrymen for scientific knowledge upon such familiar subjects. The fame of these works procured him a very extensive acquaintance with persons of eminence, who wished to profit by the remarks of so able a practical farmer; and in 1780 the university of Aberdeen acknowledged his merit by conferring upon him the degree of LL.D.

Anderson had been married in 1768; and a desire of educating a very numerous family, and enjoying literary society, induced him, in 1783, to remove to Edinburgh, leaving the management of his farm to persons properly qualified. A tract which he had written on the subject of the fisheries, though not printed, attracted the attention of the government, and he was requested, in 1784 to undertake a tour of the western coast of Scotland, for the purpose of obtaining information on this important subject. He performed the task to the high satisfaction of his employers, who, however, never offered him any remuneration. The result of his labours appeared in 1785 as *An Account of the Present State of the Hebrides and Western Coasts of Scotland; being the substance of a Report to the Lords of the Treasury*.

Passing over some minor works of Dr. Anderson, we must make honourable mention of a literary and scientific miscellany which he commenced in 1791, under the title of *The Bee*. This work was published in weekly numbers at sixpence, and, by its delightful intermixture of useful information with lighter matters of the *belles-lettres*, was eminently calculated for the improvement of the young. It was occasionally embellished with portraits, views, and draughts of scientific objects—in, it is true, a very homely style, but still not much inferior to the taste of the age. The work ran from the 22d of December, 1790, to the 21st of January, 1794, when it was at length reluctantly abandoned, because such a large proportion of the subscribers were remiss in their payments as to induce an absolute loss to the conductor. The cessation of such a meritorious little publication was the more to be regretted, as Anderson had only been able, towards its close, to bring the assistance of his numerous and distant correspondents into full play. The numbers published form eighteen volumes duodecimo, and throughout the whole of that space, we believe there does not occur one morally reprehensible line.

Among other papers in *The Bee* was a series of essays on the political progress of Britain. Though only written in what would now be considered a liberal strain, they appeared in the eyes of the sheriff as calculated to have an injurious tendency at that inflamed period; and the learned doctor was accordingly summoned to give up the name of the author. This Anderson refused, from peculiar notions as to

literary secrecy; he desired to be himself considered as the author. After a second and a third application, he still refused; and when the printers were sent for, and similarly interrogated, he charged them, in the face of the magistrates, to preserve his secret. All this was the more singular, as his own principles were known to be eminently loyal. Respect for his talents and character induced the magistrates to let the matter drop. The real author, a worthless person named Callender, being afterwards about to quit his country for America, waited upon the authorities, and insinuated that the papers were written by Lord Gardenstone, a man to whom he owed many obligations. Immediately on hearing of this infamous conduct, Anderson came forward, and refuted the charge by avowing Callender himself to be the real author. The whole of this affair reflects great credit upon the character of Dr. Anderson.

About the year 1797, this ingenious person removed with his family to London, where he undertook various works connected with his favourite study of agriculture. For several years he wrote the articles on this subject in the *Monthly Review*; and from 1799 to 1802 he conducted a separate miscellany, under the title of *Recreations in Agriculture*. From the last-mentioned date, he devoted himself almost entirely to the relaxation which advanced years and severe studies had rendered necessary, and particularly to the cultivation of his garden, which became a miniature of all his past labours. In 1801 he married a second wife, who survived him. He died on the 15th of October, 1808, at the age of sixty-nine.

In his younger days, Dr. Anderson was remarkably handsome in his person, of middle stature, and robust make; but the overstrained exertion of his mental powers afterwards shook his constitution, and hurried him into old age. Of his abilities, his works exhibit so many proofs that they may be appealed to with perfect confidence. Although a voluminous writer, there is no subject connected with his favourite pursuit on which he has not thrown new light. But his knowledge was not confined to one science. He exhibited, to give only one instance, very considerable powers of research, when, in 1773, he published, in the first edition of the *Encyclopædia Britannica*, an article under the head "Monsoon." In this he clearly predicted the result of Captain Cook's first voyage; namely, that there did not exist, nor ever would be found, any continent or large island in the southern hemisphere except New Holland alone; and this was completely verified on Captain Cook's return seven months afterwards. Upon the whole, though the name of Dr. Anderson is associated with no scientific or literary triumphs of great splendour, his exertions, by their eminent and uniform usefulness, have given him very considerable claims to respect. A minute specification of his works is to be found in the *Scots Magazine* for 1809.

ANDERSON, JOHN, M. A. An eminent Presbyterian clergyman of last century, grandfather of Professor Anderson, the subject of the next article. Of his early history very little is known, except that he received a university education, and took his degree in arts. He was afterwards preceptor to the great John, Duke of Argyle, and he mentions in his *Letters upon the Overtures concerning Kirk Sessions and Presbyteries*, that he had resided in Edinburgh for twenty-five years in early life. He seems also to have taught a school, and he is upbraided by "Curat Calder" with having been "an old pedantic dominie, teaching *hæc dat a.*" It was not, however, till after his settlement as minister of Dumbarton, that he

became known as an author. The earliest of his productions that has been discovered is entitled *A Dialogue between a Curat and a Countryman concerning the English Service, or Common-Prayer Book of England*, which was printed in quarto at Glasgow, about 1710. The question relative to the form of prayer used in Scotland immediately after the Reformation, was at this time keenly canvassed by the Scottish Episcopalians and Presbyterians, and the clergy of the former persuasion had very shortly before introduced the liturgy into their church service. (Carstares' *State Papers*.) Mr., afterwards Bishop, Sage endeavoured, in his *Fundamental Charter of Presbytery Examined*, to show that the English liturgy had been used in Scotland for at least seven years after the establishment of the Protestant religion. In this he was opposed by Mr. Anderson, who adduced many arguments to prove that it was not the English liturgy that is spoken of by the Scottish historians, but that used by the English church at Geneva. Soon afterwards Anderson published a *Second Dialogue* (dated 1711), in which, says he, "there is hardly anything of importance which is not said in the very words of the writers of the other side," and in which South, Beveridge, Hammond, and Burnet are the curates whose sentiments are opposed. *A Letter from a Countryman to a Curat* followed the dialogues, and received several answers, of which we shall only mention one, written by Robert Calder, an Episcopalian clergyman, the friend of Dr. Archibald Pitcairn, and printed in his *Miscellany Numbers relating to the Controversies about the Book of Common Prayer, &c.*, folio, 1713. To this attack Anderson replied in a pamphlet entitled *Curat Calder Whipt*. He soon after published *A Sermon preached in the Church of Ayr at the Opening of the Synod, on Tuesday the 1st of April, 1712*, printed at the desire of the Synod of Glasgow and Ayr (quarto, price sixpence); and in 1714 the work by which he is best known appeared. It has for its title, *A Defence of the Church Government, Faith, Worship, and Spirit of the Presbyterians, in answer to a Book entitled An Apology for Mr. Thomas Rhind, &c.*, 4to, and is dedicated to Archibald, Earl of Islay. About the beginning of the year 1717, Anderson informs us, "The people of Glasgow were pleased to move that I should be called to be one of the ministers of that place" (*Letter to Stewart of Pardovan*, p. 1), but the proceedings relative to this transaction strikingly illustrate the truth of Wodrow's remark in a letter to Dr. Cotton Mather.¹ "We are biting and devouring one another," says the venerable historian, "and like to be consumed one of another." After a course of opposition and debate with which it is unnecessary to trouble the reader, Mr. Anderson was at length settled in Glasgow in 1720, although it appears from M'Ure's *History* that the North-west Church, to which he was appointed, was not founded till 1721, nor finished for "a year or two thereafter." Mr. Anderson did not long survive his call to Glasgow,—the date of his death has not been ascertained, but his successor was appointed in 1723. His controversial writings are full of valuable historical information, and show him to have been thoroughly versed in theological literature, but it cannot be too much regretted that he so far indulged in intemperate language. We have not alluded to some of his smaller pamphlets, which refer merely to subjects of a temporary or local nature.

Upon the family tombstone, erected by the will of Professor Anderson, over the grave of his grand-

¹ *Wodrow's History*, new edition, vol. i. p. xxv.

father, upon the front of the North-west Church, Glasgow, was inscribed the following memorial of Mr. Anderson:—"Near this place ly the remains of the Rev. John Anderson, who was preceptor to the famous John, Duke of Argyle and Greenwich, and minister of the gospel in Dumbarton in the beginning of the eighteenth century, and in this church in the year 1720. He was the author of *The Defence of the Church-government, Faith, Worship, and Spirit of the Presbyterians*, and of several other ecclesiastical and political tracts. As a pious minister and an eloquent preacher, a defender of civil and religious liberty, and a man of wit and learning, he was much esteemed; he lived in the reign of Charles II., James II., William III., Anne, and George I. Such times, and such a man, forget not, reader, while thy country, liberty, and religion are dear to thee."

ANDERSON, JOHN, F.R.S., professor of natural philosophy in the university of Glasgow, and founder of the eminently useful institution bearing his name in that city, was born in the parish of Roseneath, in Dumbartonshire, in the year 1726. He was the eldest son of the Rev. James Anderson, minister of Roseneath, who was, in his turn, the eldest son of the Rev. John Anderson, preceptor to John, Duke of Argyle, afterwards minister of the gospel at Dumbarton, and of whom a notice is given in the preceding article. The subject of this memoir, having the misfortune to lose his father in early life, was educated by his aunt Mrs. Turner, widow of one of the ministers of the High Church of Stirling. While residing at this town, where he received the rudiments of learning, he appeared as an officer in the burgher corps raised in February, 1746, to defend it against the forces of the young Chevalier. His conduct on this occasion was worthy of his distinguished ancestor, from whose example he appears to have derived that attachment to the principles of civil and religious liberty which marked his character through life. The carbine and other arms which he carried on the walls of Stirling are preserved in the museum connected with his institution at Glasgow. He received the more advanced part of his education at the college of Glasgow, where, in 1756, he was appointed professor of oriental languages, being then in the thirtieth year of his age.

It was not in this sphere that Mr. Anderson was destined to shine with greatest lustre. His mind had a decided bent towards the exact sciences, and to the illustration of the arts with which they are connected. His translation, therefore, to the chair of natural philosophy, which took place in 1760, was highly agreeable to him, and also most fortunate for the world. While he took an early opportunity, after this event, to fulfil an important private duty, by repaying his aunt for the expenses of his education, he entered upon the business of his class with an enthusiastic ardour of application, which we may safely pronounce to have been without example in any Scottish university. Not contented with the ordinary duty of delivering a course of lectures—though he performed that duty in a manner alone sufficient to obtain distinction—he was indefatigable in studying and exemplifying the application of science to mechanical practice; visiting, for this purpose, the workshops of artisans in the town, and receiving, in return for the scientific doctrine which he had to communicate, a full equivalent of experimental knowledge. The most estimable characteristic of Professor Anderson, was a liberal and diffusive benevolence in regard to the instruction of his race. Under the inspiration of a feeling, which was in that age more rare, and therefore more meritorious, than

it is at present, he instituted, in addition to his usual class, which was strictly mathematical, one for the working-classes and others whose pursuits did not enable them to conform to the prescribed routine of academical study, illustrating his precepts by experiments, so as to render it in the highest degree attractive. He continued to teach this *anti-tega* class, as he called it, twice every week, during the session, to the end of his life; and it would not be easy to estimate the amount of good which he thus rendered to his fellow-creatures. As an instance of the liberal good sense by which he was governed in his eminently useful scheme, it is related that a mechanic having complained to his assistant, that he had scarcely time, after leaving his work, to change his dress before coming to the class, and having suggested the propriety of the operatives being allowed to attend without such change, Mr. Anderson at once acceded to it. His was a mind too strongly bent on mere usefulness to regard empty form. Yet, as a lecturer, he is allowed to have himself exhibited a surpassing elegance of manner. His style was easy and graceful, his command of language unlimited, and the skill and success with which his manifold experiments were performed could not be surpassed. He excited the interest and attracted the attention of his pupils, by the numerous and appropriate anecdotes with which he illustrated and enlivened his lectures. Enthusiastic in his profession, his whole ambition and happiness consisted in the dissemination of useful knowledge; and nothing afforded him purer pleasure than hearing that any of his pupils had distinguished themselves in the world. The only distinct work which he published in connection with his favourite science, was a valuable one, entitled *Institutes of Physics*, which appeared in 1786, and went through five editions during the next ten years.

At the commencement of those political changes in France which ended in such unhappy results, Mr. Anderson, from his ardent and liberal character, was among those who sympathized with the proceedings of the emancipated people. Previous to that period, he had invented a species of gun, the recoil of which was stopped by the condensation of common air within the body of the carriage. Having in vain endeavoured to attract the attention of the British government to this invention, he went to Paris, in 1791, carrying with him a model, which he presented to the national convention. The governing party in France at once perceived the benefit which would be derived from this invention, and ordered Mr. Anderson's model to be hung up in their hall, with the following inscription over it—"THE GIFT OF SCIENCE TO LIBERTY." Whilst he was in France, he got a six-pounder made from his model, with which he made numerous experiments in the neighbourhood of Paris, at which the famous Paul Jones, amongst others, was present; and who gave his decided approbation of the gun, as likely to prove highly useful in landing troops from boats, or firing from the round tops or poops of ships of war. Mr. Anderson, at this period, took a keen interest in the transactions which passed before his eyes. He was present when Louis XVI. was brought back from Varennes; and on the 14th of July, on the top of the altar of liberty, and in the presence of half a million of Frenchmen, he sang *Te Deum* with the Bishop of Paris, when the king took the oath to the constitution, amen being said to the ceremony by the discharge of 500 pieces of artillery. As the Emperor of Germany had drawn a military cordon around the frontiers of France, to prevent the introduction of French newspapers into

Germany, he suggested the expedient of making small balloons of paper, varnished with boiled oil, and filled with inflammable air, to which newspapers and manifestoes might be tied. This was accordingly practised, and when the wind was favourable for Germany, they were sent off, and descending in that country, were, with their appendages, picked up by the people. They carried a small flag or streamer, inscribed with a motto, of which the following is a translation:—

“O'er hills and dales, and lines of hostile troops, I float
majestic,
Bearing the laws of God and Nature to oppressed men,
And bidding them with arms their rights maintain.”

Mr. Anderson died, January 13th, 1796, in the seventieth year of his age, and the forty-first of his professorship, directing by his will, dated May 7th, 1795, that the whole of his effects, of every kind, should be devoted to the establishment of an educational institution in Glasgow, to be denominated *Anderson's University*, for the use of the unacademical classes; so that, even while he was consigned to the silent dust, he might still, by means of his honourably acquired wealth, prove of service to those whom he had benefited so much, during his own life, by personal exertion. His will was carried into effect on the 9th of June following, by the magistrates granting a charter of incorporation to the proposed institution. According to the design of the founder, there were to be four colleges—for arts, medicine, law, and theology—besides an initiatory school. Each college was to consist of nine professors, the senior professor being the president or dean. As the funds, however, were inadequate to the plan, it was at first commenced with only a single course of lectures on natural philosophy and chemistry, by Dr. Thomas Garnett, well known for his numerous scientific and medical works, and also for his *Tour through the Highlands and part of the Western Isles of Scotland*. This course was attended for the first year by nearly 1000 persons of both sexes. In 1798 a professor of mathematics and geography was appointed. The splendid apparatus and library of the founder, which were valued at £3000, added greatly to the advantages of the infant institution. In 1799 Dr. Garnett, being appointed professor in the Royal Institution at London, was succeeded by the eminent Dr. Birbeck, who, in addition to the branches taught by his predecessor, introduced a familiar system of philosophical and mechanical information to 500 operative mechanics, free of all expense, thus giving rise to mechanics' institutions. The Andersonian Institution was placed, by the will of the founder, under the inspection and control of the lord-provost, and many other honourable persons, as ordinary visitors, and under the more immediate superintendence of eighty-one trustees, who are elected by ballot, and remain in office for life. Since the first establishment of the *university*, as it may very properly be called, it has gradually been extended nearer and nearer to the original design of the founder. There are now fifteen professors, who deliver lectures on surgery, institutes of medicine, chemistry, practical chemistry, midwifery, practice of medicine, anatomy, materia medica, pharmacy and dietetics, medical jurisprudence and police, mathematics, natural philosophy, botany, logic, geography, modern languages, English literature, drawing and painting, &c. The institution now possesses handsome and commodious buildings, which belong to the corporation, and, among other additions to its means of cultivating and illustrating science, is an extensive museum of natural history

and antiquities. *Anderson's University* must be considered a wonderful example of the amount of good which one man, of no very great material resources, may do for his kind. The private fortune of one professor in the original college of Glasgow has here been found sufficient to produce a new fount of learning, not unworthy to rank with the old, and of very great practical utility to the public.

A posthumous work of Professor Anderson, entitled *Observations on Roman Antiquities between the Forth and Clyde*, appeared in 1804.

ANDERSON, ROBERT, M.D., the biographer of Smollett and Johnson, was born on 7th of January, 1750, and was the son of a feuar in the rural village of Carnwath in Lanarkshire. He received the earlier part of his education in his native place, and in the adjacent village of Libberton; was subsequently placed under the tuition of Mr. Robert Thomson, master of the grammar-school of Lanark; and finally studied in the university of Edinburgh, where he commenced attendance upon the divinity class, with the view of becoming a clergyman. He took the degree of M.D. at St. Andrews in 1778. In his early years, when pursuing his studies at Carnwath, he could find but one congenial mind in the whole of that rural district; this was an unfortunate youth, named James Græme, the son of a neighbour, who, after exhibiting considerable powers as a poet, died in his twenty-second year, and whose reliques were afterwards included by Dr. Anderson, more perhaps through the influence of friendship than deliberate taste, in his edition of the *British Poets*. Dr. Anderson first entered into practice as surgeon to the dispensary of Bamborough Castle in Northumberland; he afterwards removed to Alnwick, where he married Miss Gray, daughter of Mr. John Gray, a relation of the noble family of that name. The declining state of his wife's health, which rendered a change of air necessary, induced him, in 1784, to remove to Edinburgh, where he ever afterwards resided. He had here the misfortune to lose his amiable partner, who sank under a consumption, leaving him with three infant daughters. Dr. Anderson having secured a small independence, practised no more after this period, but engaged in such literary avocations as he felt to be agreeable to his taste, and became the centre of an agreeable coterie, in which the talents of many a youth of genius were for the first time brought into notice. About the year 1793 he began to prepare his edition of the *British Poets*, which forms thirteen volumes, large octavo, and appeared between the years 1795 and 1807. To the works of each poet is prefixed a biographical memoir by Dr. Anderson. In 1793 he married for his second wife Miss Dale, daughter of Mr. David Dale, schoolmaster in East Lothian. A collection of the works of Smollett, by Dr. Anderson, with a memoir prefixed, has gone through eight editions. To the last edition is affixed a highly characteristic likeness of the editor. The memoir has been published repeatedly in a distinct shape, and is a very respectable production. Dr. Anderson also published a *Life of Dr. Samuel Johnson, with Critical Observations on his Works*, which has passed through several editions. For several years before the end of the eighteenth century, Dr. Anderson was editor of the *Edinburgh Magazine*, a rival of the *Scots Magazine*, more varied and lively in its details, and which afforded him an opportunity of bringing forward the productions of his young friends. This work commenced in the year 1784, and at the end of 1803 was incorporated with the *Scots Magazine*: it was much indebted to its proprietor, James Sibbald,

editor of the *Chronicle of Scottish Poetry*, to Lord Hailes, and other eminent literary characters. Among the publications which Dr. Anderson gave to the world, must be included his edition of the *Works of John Moore, M.D., with Memoirs of his Life and Writings*, Edinburgh, 1820, 7 vols. 8vo; and an edition of the poems of Robert Blair, Edinburgh, 1826, 12mo. The great incident of Dr. Anderson's literary life was his connection with the commencement of the career of Thomas Campbell. When Campbell first visited Edinburgh in 1797, being then in his twentieth year, he gained the friendship of Dr. Anderson, who, on being shown a copy of elegiac verses, written by him two years before, when an obscure tutor in Mull, predicted his great success as a poet. It was through Dr. Anderson, in 1798, that Campbell was introduced to the circle of his distinguished literary associates in Edinburgh; and he it was who encouraged him by his friendly advice, and assisted him by his critical acumen, in the publication of his celebrated poem, the *Pleasures of Hope*, for the high character of which he had, previously to its appearance, pledged his word to the public. In acknowledgment of his friendship, the grateful poet dedicated his work to Dr. Anderson. During the later years of his life, this venerable author, though he indulged as much as ever in literary society, gave no work to the public.

As a literary critic, Dr. Anderson was distinguished by a warm sensibility to the beauties of poetry, and by extreme candour. His character as a man was marked by perfect probity in all his dealings, and unshaken constancy in friendship. His manner was lively and bustling; and from his long-continued acquaintance with the literary world, he possessed an unrivalled fund of that species of gossip and anecdote which gives so much pleasure in Boswell's *Life of Johnson*.

Dr. Anderson died of dropsy in the chest, February 20, 1830, in his eighty-first year.

ANDERSON, Rev. T. G. TORRY. This clerical poet, the son of the Rev. Patrick Torry, D.D., titular Bishop of St. Andrews, Dunkeld, and Dunblane, was born at Peterhead on the 9th of July, 1805. Having been taught the elements of learning at the parish school of Peterhead, he afterwards became a student in Marischal College, Aberdeen, and the university of Edinburgh. He was admitted into holy orders in 1827, as minister of St. John's Episcopal church, Portobello; afterwards became assistant in St. George's Episcopal chapel, Edinburgh; and finally was transferred to the ministerial charge of St. Paul's Episcopal church, Dundee. This charge he was obliged to resign in 1855, in consequence of bad health; and after this period he resided on his estate of Fawside, Kincardineshire, to which he had succeeded in 1850, in consequence of the death of Dr. Young, his maternal uncle. Mr. Anderson died at Aberdeen on the 20th of June, 1856. He was three times married, and left at his death a widow and six children. Although he diligently fulfilled the duties of his sacred office, Mr. Anderson was better known by his songs than his sermons, some of which attained a wide popularity, especially those entitled "The Araby Maid," "The Maiden's Vow," and "I love the Sea," the music as well as the words of these last two songs being his own composition. It was a union of the musical and poetical in the same mind, which, however common among the poets of the classical, and minstrels of the mediæval ages, is very seldom found among the bards and song-makers of our own day,

and is therefore the more worthy of notice and commendation. Mr. Anderson was also an extensive contributor to *Poetical Illustrations of the Achievements of the Duke of Wellington and his Companions in Arms*, published in 1852.

ANDERSON, WALTER, D.D. The era of this gentleman's birth is unknown; he died at an advanced age, July, 1800, after having been minister of the parish of Chirnside for fifty years. He is a remarkable specimen of that class of authors who, without the least power of entertaining or instructing their fellow-creatures, yet persist in writing and publishing books, which nobody ever reads, and still, like the man crazed by the lottery, expect that the next, and the next, and the next will be attended with success. Perhaps Anderson's *cacoethes scribendi* received its first impulse from the following ludicrous circumstance. His parish comprehending the house of Ninewells, he was often entertained there, in company with the brother of the proprietor—the celebrated David Hume. The conversation having turned one day on the success of Mr. Hume as an author, Anderson said, "Mr. David, I dare say other people might write books too; but you clever fellows have taken up all the good subjects. When I look about me, I cannot find one unoccupied." Hume, who liked a joke upon an unsuspecting clergyman, said, "What would you think, Mr. Anderson, of a history of Croesus, King of Lydia—that has never yet been written." Mr. Anderson was delighted with the idea, and, in short, "upon that hint he wrote." In 1755 was published the *History of Croesus, King of Lydia*, in four parts; containing Observations on the ancient notion of Destiny or Dreams, on the origin and credit of the Oracles, and the Principles upon which their Oracles were defended against any attack. What is perhaps the best part of the jest, the work was honoured with a most serio-burlesque notice in the first *Edinburgh Review*, then just started by Hume, Smith, Carlyle, and other wits—the article being written, we have no doubt, by the very man who incited the unhappy author to his task.

The *History of Croesus* was also the subject of a critique in the second number of the *Critical Review*, which had then been just started in London by Smollett. The article in the latter periodical bears such evident marks of the pen of the distinguished editor, and refers to such an extraordinary work, that we shall make no apology for the following extracts.

After remarking that the volume has been chiefly compiled from the episodes of Herodotus, that it exhibits a miserable flatness of style, and that all the facts scattered throughout its 235 pages might have been related in three or four, the critic proceeds to say—"We are apt to believe that this is the first essay of some young historian, who has been more intent upon forming his style and displaying his learning, than careful in digesting his plan and combining his materials; the subject is too meagre to afford nourishment to the fancy or understanding; and one might as well attempt to build a first-rate man-of-war from the wreck of a fishing-boat, as to compose a regular history from such a scanty parcel of detached observations. The compiler has been aware of this deficiency, and has filled up his blank paper with unnecessary argument, and a legion of eternal truths, by way of illustration. What could be more unnecessary, for example, than a detail of reasons for doubting the divinity or dæmoniacism of the ancient oracles? Who believes, at this time of day, that they were either inspired by the deity or influenced by the devil? What can be more super-

fluous than a minute commentary and investigation of the absurdities in the plea of the priestess, when she was taxed with falsehood and equivocation? But we beg the author's pardon; he wrote for readers that dwell beyond the Tweed, who have not yet renounced all commerce with those familiar spirits, which are so totally discarded from this part of the island. There is still a race of soothsayers in the Highlands, derived, if we may believe some curious antiquaries, from the Druids and Bards, that were set apart for the worship of Apollo. The author of the history now before us may, for aught we know, be one of these venerable seers; though we rather take him to be a Presbyterian teacher, who has been used to expound apothegms that need no explanation."

The *History of Cræsus, King of Lydia*, one of the most curious productions recognized in the history of *literary mania*, is now extremely rare—not by any means from the absorbing appreciation of the public, but rather apparently from the very limited extent of its first circulation.

The worthy author, though perhaps daunted a little by the reception of his first attempt, in time recovered the full tone of his literary ambition; and he next attempted a work of much larger compass, which appeared in 1769, in two quarto volumes, under the title of the *History of France during the Reigns of Francis II. and Charles IX.*, to which is prefixed a review of the General History of the Monarchy from its origin to that period. The success of this work was much like that of its predecessor; yet in 1775 the author published a continuation in one volume, under the title, *The History of France, from the commencement of the reign of Henry III., and the rise of the Catholic League, to the peace of Worms and the establishment of the famous Edict of Nantes in the reign of Henry IV.* In 1783 appeared two further volumes, embracing the history from the commencement of the reign of Louis XIII. to the general peace of Munster. But these continuous efforts were not drawn forth by the encouragement of the public; they were solely owing to the desperate *cacoethes* of the worthy writer, which would take no hint from the world—no refusal from fame. It is said that he was solely enabled to support the expense of his unrequited labour by a set of houses belonging to himself in Dunse (too appropriate locality!), one of which was sold for every successive quarto, till at last something like a street of good habitable tenements in that thriving town was converted into a row of unreadable volumes in his library. "Dr. Anderson," says the *Gentleman's Magazine*, "displays none of the essential qualities of historic writing, no research into the secret springs of action, no discrimination of character, and no industry in accumulating and examining authorities. Even as a compiler he is guided only by one set of materials which he found in the French writers, and may therefore be consulted by the English reader, as a collection of their opinions, while he is highly censurable in not having recourse to original papers and documents respecting the affairs of his own country. His style is uniformly tame, and defaced by colloquial barbarisms."

In a literary history of this deplorable character, it is gratifying to find that one effort was at length judged worthy of some praise. This was a work subsequent to the above, entitled *The Philosophy of Ancient Greece investigated, in its origin and progress, to the era of its greatest celebrity, in the Ionian, Italian, and Athenian Schools, with remarks on the delineated system of their founders*. His principle in this work, according to the authority just quoted, appears to have been "to supply the deficiencies in Mr. Stanley's work, and to give place to remarks upon the mean-

ing employed by the most eminent Grecian philosophers, in support of their physical, theological, and moral systems; and to give a fuller and more connected display of their theories and arguments, and to relieve the frigidty of their bare details by interspersing observations." In this work he displays much learning, and is in general both accurate and perspicuous, although he is still deficient in the graces of style. Perhaps it would have been more successful had it not appeared at the same time with Dr. Enfield's excellent abridgment of Brucker's *History of Philosophy*.

One of the last attempts of Dr. Anderson was a pamphlet against the principles of the French Revolution. This being not only written in his usual heavy style, but adverse to the popular sentiments, met with so little sale that it could scarcely be said to have been ever published. However the doctor was not discouraged; adopting rather the maxim, "*contra audentior ito*," he wrote a ponderous addition or appendix to the work, which he brought with him to Edinburgh, in order to put it to the press. Calling first upon his friend Principal Robertson, he related the whole design, which, as might be expected, elicited the mirthful surprise of the venerable historian. "Really," said Dr. Robertson, "this is the maddest of all your schemes—what! a small pamphlet is found heavy, and you propose to lighten it by making it ten times heavier! Never was such madness heard of!" "Why, why," answered Dr. Anderson, "did you never see a kite raised by boys?" "I have," answered the principal. "Then, you must have remarked that, when you try to raise the kite by itself, there is no getting it up: but only add a long string of papers to its tail, and up it goes like a laverock!" The reverend principal was completely overcome by this argument, which scarcely left him breath to reply, so heartily did he laugh at the ingenuity of the resolute author. However, we believe, he eventually dissuaded Dr. Anderson from his design.

ANDERSON, WILLIAM. This poet and miscellaneous writer was born in the end of December, 1805. He originally studied for the law, but instead of entering the profession of a lawyer, he made the dangerous choice of authorship, and adhered to it for the rest of his life. It was unfortunate that this choice was made at so early a period, as his excellent natural talents were not directed by a literary education or extensive reading, by which he might have won both distinction and success. Having thrown himself into the tide with all the generous enthusiasm of youth, he was borne along in its whirl, and in the career that awaited him it was much that he was enabled to keep his head above water, and educate his family for a life of respectability and comfort. As a literary adventurer thus circumstanced, he was everything by turns—editor or sub-editor of newspapers, publishers' literary assistant, compiler or author of histories and biographies, or occasionally publishing a work at his own risk; while his sphere of operation in these different capacities was sometimes London, sometimes Edinburgh, and occasionally the provincial towns of England and Scotland. Like many in a similar situation, he had no independent choice either of locality for his residence or subject for his pen, and in both cases was drifted to and fro by the requirements of the press or the engagement of his publisher. But bravely he fought out this battle of life from youth to old age; and even when his body was racked out of form by an excruciating malady that had wasted him for years, and when his mind was embittered by ever-recurring disappointment, he was still industrious, still

ready for a fresh attempt in authorship, and still hopeful of the result. Even those who knew nothing of him save his indomitable perseverance, wondered that it could still make head against such adverse circumstances. Visited at last by heart disease, the inevitable consequence of a body so distorted by rheumatism, he had nevertheless gone to London by sea, when he died suddenly on the 2d of August, 1866, being a few days after his arrival there, and was buried in the cemetery of Highgate.

The last and also the largest and best work written by Mr. Anderson, and the one through which his name will longest survive, is that called *The Scottish Nation*, published by the Messrs. Fullarton, Edinburgh, in three large volumes imperial 8vo. It is not only a biographical record of eminent Scotsmen, but a history of the Scottish clans and distinguished families, and contains a mass of valuable information, which the author was employed many years in collecting. In all his multifarious prose writings, although most of them were written for the day and upon the spur of urgency, Mr. Anderson's style was always distinguished by its elegance and correctness, its clearness and force. Under happier circumstances, it was evident from these that he might have held a distinguished place in authorship. In conversation his wit was remarkable, whether telling a story or making an observation, and it assumed every variety of character from the light and comic to the caustic and severe. Poetry, however, had been the chief object from the beginning of Mr. Anderson's literary affections, and he only abandoned it with reluctance, when the experience of years showed him that it was an unprofitable resource, except to those who had leisure and talent to reach the loftier summits of Parnassus. His chief poetical publications were a small volume of short poems and songs written in early life—among which are some of high merit, so that they have been published in some of our best popular collections; and *Landscape Lyrics*, written in matured life, and which he always regarded as the best of his poetical productions.

ARBUTHNOT, ALEXANDER, an eminent divine of the reign of James VI., son of the laird of Arbuthnot, was born in the year 1538. Having studied languages and philosophy in the university of Aberdeen, and civil law under the famous Cujacius at Bourges in France, he took ecclesiastical orders, and became in his own country a zealous supporter of the Reformation. The period of his entrance into public life was 1563, when Queen Mary was in possession of the kingdom. His eminent abilities and acquirements pointed him out, young as he was, as a leading man in the church, and accordingly he took a prominent part in several General Assemblies. In that of 1568 he was appointed by his brethren to examine a work entitled *The Fall of the Roman Church*, which was objected to because it styled the king the head of the church. The result of his deliberations was an order to Bassandynne, the printer, not to print any more books till he had expunged this passage, and also taken away a lewd song which he had published at the end of an edition of the Psalms. The assembly also ordered that henceforth no book should be published till licensed by their commission. "Thus," it has been remarked, "the reformed clergy, who owed their emancipation to the right of private judgment, with strange inconsistency obstructed the progress of free inquiry by taking upon themselves the regulation of the press."

Arbuthnot was soon after appointed minister of

the parishes of Arbuthnot and Logic-Buchan, and in 1569 he became principal of the university of Aberdeen. He was a member of the General Assembly held at St. Andrews in 1572, in which strenuous opposition was made to a scheme of church-government called the *Book of Policy*, which was invented by certain statesmen, at the head of whom was the Regent Morton, to restore the old titles of the church, and by means of titular incumbents, retain all the temporalities among themselves. In the General Assemblies held at Edinburgh in 1573 and 1577, Arbuthnot was chosen moderator; and he appears to have been constantly employed, on the part of the church, in the commission for conducting the troublesome and tedious contest with the regency concerning the plan of ecclesiastical government to be adopted in Scotland. This commission, under the name of the Congregation, at length absorbed so much power, that the assembly was left little to do but to approve its resolutions. The part which Arbuthnot took in these affairs gave offence to James VI., and the offence was increased by the publication of Buchanan's *History*, of which Arbuthnot was the editor. It was therefore resolved to restrain him by an oppressive act of arbitrary power; and a royal order was issued, forbidding him to absent himself from his college at Aberdeen. The clergy, who saw that the design of this order was to deprive them of the benefit of Arbuthnot's services, remonstrated; the king, however, remained inflexible, and the clergy submitted. This persecution probably affected Arbuthnot's health and spirits; for the next year, 1583, he fell into a gradual decline and died. Arbuthnot appears to have possessed much good sense and moderation, and to have been well qualified for public business. His knowledge was various and extensive; he was a patron of learning; and at the same time that he was active in promoting the interests of the reformed church, he contributed to the revival of a taste for literature in Scotland. The only prose production which he has left, is a learned and elegant Latin work, entitled *Orationes de Origine et Dignitate Juris* [Orations on the Origin and Dignity of the Law], which was printed in 4to at Edinburgh in 1572. For some specimens of vernacular poetry, supposed to be his composition, we may refer to Irving's *Lives of the Scottish Poets*, and M'Crie's *Life of Andrew Melville*. His character has received a lasting eulogy, in the shape of an epitaph, from the pen of his friend Melville. See *Deliciae Poetarum Scotorum*, ii. p. 120.

ARBUTHNOT, JOHN, M.D., one of the constellation of wits in the reign of Queen Anne, and the most learned man of the whole body, was the son of a Scottish clergyman, who bore a near relationship to the noble family of this name and title. He was born at Arbuthnot in Kincardineshire, soon after the Restoration, and received his education at the university of Aberdeen, where he took the degree of M.D. The father of Arbuthnot was one of those members of the Church of Scotland who, not being able to comply with the Presbyterian system introduced at the Revolution, were obliged to resign their charges. He retired to a small estate, which he possessed by inheritance; while his sons, finding their prospects blighted in their own country, were under the necessity of going abroad to seek their fortune. John carried his Jacobitism, his talents, and his knowledge of physic to London, where he at first subsisted as a teacher of mathematics. His first literary effort bore a reference to this science: it was an *Examination of Dr. Wood-*

ward's *Account of the Deluge*, a work which had been published in 1695, and which, in Dr. Arbuthnot's estimation, was irreconcilable with just philosophical reasoning upon mathematical principles. This publication, which appeared in 1697, laid the foundation of the author's literary reputation, which not long after received a large and deserved increase by his *Essay on the Usefulness of Mathematical Learning*. The favour which he acquired by these publications, as well as by his agreeable manners and learned conversation, by degrees introduced him into practice as a physician. Being at Epsom when Prince George of Denmark was suddenly taken ill, he was called in, and had the good fortune to effect a cure. The prince immediately became his patron, and in 1709 he was appointed fourth physician in ordinary to the queen (Prince George's royal consort), in which situation he continued till her majesty's death in 1714. In 1704 Dr. Arbuthnot had been elected a member of the Royal Society, in consequence of his communicating to that body a most ingenious paper on the equality of the numbers of the sexes; a fact which he proved by tables of births from 1629, and from which he deduced the reasonable inference that polygamy is a violation of the laws of nature. In 1710 he was elected a member of the Royal College of Physicians.

This was the happy period of Dr. Arbuthnot's life. Tory principles and Tory ministers were now triumphant; he enjoyed a high reputation, a lucrative practice, and a most honourable preferment; he also lived in constant intercourse with a set of literary men, almost the greatest who had ever flourished in England, and all of whom were of his own way of thinking in regard to politics. This circle included Pope, Swift, Gay, and Prior. In 1714 he engaged with Pope and Swift in a design to write a satire on the abuse of human learning in every branch, which was to have been executed in the humorous manner of Cervantes, the original inventor of this species of satire, under the history of feigned adventures. But the prosecution of this design was prevented by the queen's death, which lost Arbuthnot his situation, and proved a death-blow to all the political friends of the associated wits. In the dejection which befell them, they never went farther than an essay, chiefly written by Arbuthnot, under the title of the *First Book of the Memoirs of Martinus Scriblerus*. "Polite letters," says Warburton in his edition of Pope's works, "never lost more than in the defeat of this scheme, in the execution of which, each of this illustrious triumvirate would have found exercise for his own particular talents; besides constant employment for those which they all had in common. Dr. Arbuthnot was skilled in everything which related to science; Mr. Pope was a master in the fine arts; and Dr. Swift excelled in a knowledge of the world. Wit they had in equal measure; and this so large, that no age perhaps ever produced three men to whom nature had more bountifully bestowed it, or art had brought it to higher perfection." We are told by the same writer that the *Travels of Gulliver* and the *Memoirs of a Parish Clerk* were at first intended as a branch of the *Memoirs of Scriblerus*. In opposition to what Warburton says of the design, we may present what Johnson says of the execution. "These memoirs," says the doctor, in his life of Pope, "extend only to the first part of a work projected in concert by Pope, Swift, and Arbuthnot. Their purpose was to censure the abuses of learning by a fictitious life of an infatuated scholar. They were dispersed; the design never was completed: and Warburton laments its miscarriage, as an event very disastrous to polite letters.

If the whole may be estimated by this specimen, which seems to be the production of Arbuthnot, with a few touches by Pope, the want of more will not be much lamented; for the follies which the writer ridicules are so little practised, that they are not known; nor can the satire be understood but by the learned. He raises phantoms of absurdity, and then drives them away. He cures diseases that were never felt. For this reason, this joint production of three great writers has never attained any notice from mankind." With the opinion of Dr. Johnson we entirely coincide, so far as the *Scriblerus* is concerned; but we think that Arbuthnot was unfortunate in the part of the design which he selected, and that, in satirising more palpable follies, he might have been more successful. The success of Swift, in ridiculing mankind in general in his *Gulliver*, is surely a sufficient reason, if no other existed, for the lamentation of Warburton.

At the death of the queen, when it pleased the new government to change all the attendants of the court, the immortal suffered with the mortal; Arbuthnot, displaced from his apartments at St. James', took a house in Dover street, remarking philosophically to Swift that he "hoped still to be able to keep a little habitation warm in town." His circumstances were never so prosperous or agreeable after this period. With the world at large, success makes merit—the want of it the reverse; and it is perhaps impossible for human nature to think so highly of a man who has been improperly deprived of some external mark of distinction and honour, as of him who wears it without so much desert. The wit, left to his own resources, and with a rising family to support, seems to have now lived in some little embarrassment.

In 1717 Arbuthnot, along with Pope, gave assistance to Gay, in a farce entitled "Three Hours after Marriage," which, strange to say, was condemned the first night. A rival wit wrote upon this subject:—

"Such were the wags who boldly did adventure
To club a farce by tripartite indenture;
But let them share their dividend of praise,
And wear their own fool's cap instead of bays."

In 1722 Dr. Arbuthnot found it necessary for his health to indulge in a visit to Bath. He was accompanied on this occasion by a brother who was a banker at Paris, and whose extraordinary character called forth the following striking description from Pope: "The spirit of philanthropy, so long dead to our world, seems revived in him: he is a philosopher all fire; so warmly, nay so wildly, in the right, that he forces all others about him to be so too, and draws them into his own vortex. He is a star that looks as if it were all on fire, but is all benignity, all gentle and beneficial influence. If there be other men in the world that would serve a friend, yet he is the only one, I believe, that could make even an enemy serve a friend." About this time, the doctor thus described himself in a letter to Swift: "As for your humble servant, with a great stone in his right kidney, and a family of men and women to provide for, he is as cheerful in public affairs as ever."

Arbuthnot, in 1723, was chosen second censor of the Royal College of Physicians; in 1727 he was made an Elect, and had the honour to pronounce the Harveian oration for the year. In 1727 also appeared his great and learned work, entitled *Tables of Ancient Coins, Weights, and Measures, explained and exemplified in several Dissertations*. He continued to practise physic with good reputation, and diverted his leisure hours by writing papers of wit and humour. Among these may be mentioned one,

which appeared in 1731, in the shape of an epitaph upon the infamous Colonel Charteris, and which we shall present in this place as perhaps the most favourable specimen of Dr. Arbuthnot's peculiar vein of talent:—

“Here continueth to rot the body of Francis Charteris, who, with an inflexible constancy, and inimitable uniformity of life, persisted, in spite of age and infirmities, in the practice of every human vice; excepting prodigality and hypocrisy; his insatiable avarice exempted him from the first, his matchless impudence from the second. Nor was he more singular in the undeviating pravity of his manners, than successful in accumulating wealth; for, without trade or profession, without trust of public money, and without bribe-worthy service, he acquired, or more properly created, a ministerial estate. He was the only person of his time who could cheat with the mask of honesty, retain his primeval meanness when possessed of ten thousand a year, and, having daily deserved the gibbet for what he did, was at last condemned to it for what he could not do.—Oh! indignant reader! Think not his life useless to mankind! Providence connived at his execrable designs, to give to after-ages a conspicuous proof and example of how small estimation is exorbitant wealth in the sight of God, by his bestowing it on the most unworthy of all mortals.”¹

Arbuthnot, about this time, wrote a very entertaining paper on the *Alterations or Scolding of the Ancients*. In 1732 he contributed towards detecting and punishing the scandalous frauds and abuses that had been carried on under the specious name of *The Charitable Corporation*. In the same year he published his *Treatise on the Nature and Choice of Aliments*, which was followed, in 1733, by his *Essay on the Effects of Air on Human Bodies*. He is thought to have been led to these subjects by the consideration of his own case—an asthma, which, gradually increasing with his years, became at length desperate and incurable. A little before his last publication, he had met with a severe domestic affliction in the loss of his son Charles, “whose life,” he says in a letter to Swift, “if it had so pleased God, he would willingly have redeemed with his own.” He now retired in a state of great debility to Hampstead; from whence, in a letter to Pope, July 17th, 1734, he gives the following philosophic, and we may add, touching, account of his condition:—

“I have little doubt of your concern for me, nor of that of the lady you mention. I have nothing to repay my friends with at present, but prayers and good wishes. I have the satisfaction to find that I am as officiously served by my friends, as he that

¹ This paragon of wickedness, who was a native of Scotland, is thus described by Pope, but we believe, as in the epitaph itself, with much exaggeration. “Francis Charteris, a man infamous for all vices. When he was an ensign in the army, he was drummed out of the regiment for a cheat; he was banished Brussels, and turned out of Ghent, on the same account. After a hundred tricks at the gaming-tables, he took to lending of money at exorbitant interest, and on great penalties, accumulating premium, interest, and capital into a new capital, and seizing to a minute when the payment became due; in a word, by a constant attention to the vices, wants, and follies of mankind, he acquired an immense fortune. . . . He was twice condemned for rapes and pardoned, and the last time not without imprisonment in Newgate, and large confiscations. He died in Scotland in 1731, aged sixty-two. The populace, at his funeral, raised a great riot, almost tore the body out of the coffin, and cast dead dogs, &c., into the grave along with it.” We may add that the mourners had to defend themselves from the mob with their swords. (See *Traditions of Edinburgh*.) One remarkable feature of Charteris's character is not generally known; though a bully and a coward, he had his fighting days; he would suffer himself to be kicked for refusing a challenge one day, and the next would accept another and kill his man.

has thousands to leave in legacies; besides the assurance of their sincerity. God Almighty has made my distress as easy as a thing of that nature can be. I have found some relief, at least sometimes, from the air of this place. My nights are bad, but many poor creatures have worse.”

In a letter about the same time to Swift, he says he came to Hampstead, not for life, but for ease. That he had gained in a slight degree from riding; but he was “not in circumstances to live an idle country life;” and he expected a return of the disorder in full force on his return in winter to London. He adds, “I am at present in the case of a man that was almost in harbour, but was again blown back to sea; who has a reasonable hope of going to a good place, and an absolute certainty of leaving a very bad one. Not that I have any particular disgust at the world, for I have as great comfort in my own family, and from the kindness of my friends, as any man; but the world in the main displeaseth me; and I have too true a presentiment of calamities that are like to befall my country. However, if I should have the happiness to see you before I die, you will find that I enjoy the comforts of life with my usual cheerfulness. . . . My family give you their love and service. The great loss I sustained in one of them gave me my first shock; and the trouble I have with the rest, to bring them to a good temper, to bear the loss of a father who loves them, and whom they love, is really a most sensible affliction to me. I am afraid, my dear friend, we shall never see one another more in this world. I shall, to the last moment, preserve my love and esteem for you, being well assured that you will never leave the paths of virtue and honour for all that is in the world. This world is not worth the least deviation from that way,” &c. In such a strain did this truly good man discourse of his own certain and immediate death, which accordingly took place, February, 1735, in his house, Cork Street, Burlington Gardens, to which he had returned from Hampstead at the approach of winter.

Arbuthnot's character was given by his friend Swift in one dash: “He has more wit than we all have, and more humanity than wit.” “Arbuthnot,” says Dr. Johnson in his life of Pope, “was a man of great comprehension, skilful in his profession, versed in the sciences, acquainted with ancient literature, and able to animate his mass of knowledge by a bright and active imagination; a scholar with great brilliancy of wit; a wit who, in the crowd of life, retained and discovered a noble ardour of religious zeal.” Lord Orrery has thus entered more minutely into his character: “Although he was justly celebrated for wit and learning, there was an excellence in his character more amiable than all his other qualifications, I mean the excellence of his heart. He has shown himself equal to any of his contemporaries in wit and vivacity, and he was superior to most men in acts of humanity and benevolence. His very sarcasms are the satirical strokes of good nature: they are like slaps in the face given in jest, the effects of which may raise blushes, but no blackness will appear after the blow. He laughs as jovially as an attendant upon Bacchus, but continues as sober and considerate as a disciple of Socrates.”

The wit, to which Swift's was only allowed the second place, was accompanied by a guileless heart, and the most perfect simplicity of character. It is related of its possessor, that he used to write a humorous account of almost every remarkable event which fell under his observation, in a folio book, which lay in his parlour; but so careless was he about his writings after he was done with them, that,

while he was writing towards one end of this work, he would permit his children to tear out the leaves from the other, for their paper kites. This carelessness has prevented many of the works of Dr. Arbuthnot from being preserved, and no correct list has ever been given. A publication in two volumes, 8vo, at Glasgow, in 1751, professing to be his *Miscellaneous Works*, was said by his son to consist chiefly of the compositions of other people. He was so much in the habit of writing occasional pieces anonymously, that many fugitive articles were erroneously attributed to him: he was at first supposed to be the author of *Robinson Crusoe*. He scarcely ever spoke of his writings, or seemed to take the least interest in them. He was also somewhat indolent. Swift said of him, that he seemed at first sight to have no fault, but that he could not walk. Besides this, he had too much simplicity and worth to profit by the expedients of life: in Swift's words,

"He knew his art, but not his trade."

Swift also must be considered as insinuating a certain levity of feeling, with all his goodness, when he says, in anticipation of his own death,

"Poor Pope will grieve a month, and Gay
A week, and Arbuthnot a day!"

though the habitual cheerfulness of his disposition may have been all that the poet had in his eye. The only other work ascertained as Arbuthnot's, besides those mentioned, is the celebrated *History of John Bull*, a political allegory, which has had many imitations, but no equal. He also attempted poetry, though without any particular effort. A philosophical poem, of his composition, entitled "ΓΝΩΘΙ ΣΕΑΤΤΟΝ" [Know Yourself], is printed in Dodsley's *Miscellanies*. He left a son, George, who was an executor in Pope's will, and who died in the enjoyment of a lucrative situation in the exchequer office towards the end of the last century; and a daughter, Anne, who was honoured with a legacy by Pope. His second son, Charles, who died before himself, had been educated in Christ Church College, Oxford, and entered into holy orders.

ARGYLE. See CAMPELL.

ARMSTRONG, JOHN, M.D., author of the well-known poem entitled *The Art of Preserving Health*, was born, about 1709, in the parish of Castleton, Roxburghshire, where his father and brother were successively ministers. He might almost be styled a poet by right of birthplace, for the parish of Castleton is simply the region of Liddesdale, so renowned for its heroic lays, the records of deeds performed by the Border reivers, among whom the family of the poet bore a distinguished rank. The rude and predatory character of this district had, however, passed away before the commencement of the eighteenth century; and young Armstrong, though his lullabies were no doubt those fine old ballads which have since been published by Sir Walter Scott, seems to have drawn from them but little of his inspiration. It was as yet the fashion to look upon legendary verses as only fit for nurses and children; and nothing was thought worthy of the term poetry, unless it were presented in trim artificial language, after the manner of some distinguished classic writer. It is therefore by no means surprising that Armstrong, though born and cradled in a land full of beautiful traditional poetry, looked upon it all, after he had become an educated man, as only Doric trash, and found his Tempe in the bowers of Twickenham instead of the lonely heaths of Liddesdale.

Being educated for the medical profession at the university of Edinburgh, under the elder Monro, Armstrong, in 1732, took his degree as M.D. with much reputation, the subject of his treatise being *Tabes Puerulenta*. He had ere this period addicted himself to the composition of verses. We are informed that, to relieve the tedium of a winter spent in "a wild romantic country"—probably Liddesdale—he wrote what he intended for an imitation of Shakspeare, but which turned out to resemble rather the poem of *Winter*, then just published by Thomson. The bard of the *Seasons*, hearing of this composition, which so strangely and so accidentally resembled his own, procured a sight of it by means of a mutual friend, and, being much pleased with it, brought it under the notice of Mr. David Mallet, Mr. Aaron Hill, and Dr. Young, all of whom joined with him in thinking it a work of genius. Mallet even requested the consent of the author to its publication, and undertook that duty, though he afterwards gave up the design.

Armstrong was probably led by this flattering circumstance to try his fortune in London, where his countrymen Thomson and Mallet had already gained literary distinction. In 1735 he is found publishing, in that capital, a humorous attack upon empirics, in the manner of Lucian, entitled *An Essay for Abridging the Study of Physic*, to which is added, A Dialogue betwixt Hygeia, Mercury, and Pluto, relating to the Practice of Physic, as it is managed by a certain illustrious Society; and an epistle from Ubsbeck the Persian to Joshua Ward, Esq. The essay, besides its sarcastic remarks on quacks and quackery, contains many allusions to the neglect of medical education among the practising apothecaries; but the author had exhausted his wit in it, and the dialogue and epistle are consequently flat and insipid. In 1737 he published a serious professional piece, styled *A Synopsis of the History and Cure of the Venereal Disease*, 8vo, inscribed in an ingenious dedication to Dr. Alexander Stuart, as to "a person who had an indisputable right to judge severely of the performance presented to him." He probably designed the work as an introduction to practice in this branch of the medical profession; but it was unfortunately followed by his poem entitled *The Economy of Love*, which, though said to have been designed as merely a burlesque upon certain didactic writers, was justly condemned for its warm and alluring pictures, and its tendency to inflame the passions of youth. It appears by one of the "cases of literary property," that Andrew Millar, the bookseller, paid fifty pounds for the copyright of this poem; a sum ill-gained, for the work greatly diminished the reputation of the author. After it had passed through many editions, he published one, in 1768, in which the youthful luxuries that had given offence to better minds were carefully pruned. But the offence had been already perpetrated, and it was too late to undo it.

In 1744 Dr. Armstrong made some amends for this indiscretion, by publishing *The Art of Preserving Health*, a didactic poem in blank verse, extending through four books, each of which contains a particular branch of the subject. This very meritorious work raised his reputation to a height which his subsequent efforts scarcely sustained. It is written in a taste which would not now be considered very pure or elegant; but yet, when the subject and the age are considered, there is amazingly little to be condemned. Dr. Warton has justly remarked the refined terms in which the poet, at the end of his third book, has described an English plague of the fifteenth century, entitled "the sweating sickness."

"There is a classical correctness and closeness of style in this poem," says Dr. Warton, "that are truly admirable, and the subject is raised and adorned by numberless poetical images." Dr. Mackenzie, in his *History of Health*, bestowed similar praises on this poem, which was indeed everywhere read and admired.

In 1741 Armstrong solicited the patronage of Dr. Birch, to be appointed physician to the fleet then about to sail for the West Indies; but he does not seem to have obtained the object of his desire. In 1746, when established in reputation by his *Art of Preserving Health*, he was appointed one of the physicians to the hospital for lame and sick soldiers behind Buckingham House. In 1751 he published his poem on *Benevolence*, in folio, a production which seems to have come from the heart, and contains sentiments which could have been expressed with equal ardour only by one who felt them. His *Taste*, an *Epistle to a Young Critic*, 1753, 4to, is a lively and spirited imitation of Pope, and the first production in which Armstrong began to view men and manners with a splenic eye. His next work was less meritorious. It was entitled *Sketches or Essays on Various Subjects*, and appeared under the fictitious name of Lancelot Temple, Esq. The critical examiners of Dr. Armstrong's merits allow to this work the credit of exhibiting much humour and knowledge of the world, but find it deformed by a perpetual flow of affectation, a struggle to say smart things, and, above all, a disgusting repetition of vulgar oaths and exclamations—forms of expression to which the poet, it seems, was also much addicted in conversation. In some of these sketches, Armstrong is said to have had assistance from the notorious John Wilkes, with whom he lived in habits of intimacy; but it is certain that the contributions of this gentleman cannot have been great, as the work is much inferior to the literary style of the demagogue of Aylesbury, who, whatever might be his moral failings, is allowed to have had a chaste classical taste, and a pure vein of humour.

Armstrong had sufficient professional interest in 1760 to obtain the appointment of physician to the army in Germany. From that country he wrote *Day*, a Poem, addressed as an epistle to John Wilkes, Esq. This lively piece, which professes to embody an account of all the proper indulgences, moral and physical, of twenty-four hours, was, it is said, published in an imperfect shape, by some clandestine editor. It was never added to the collected works of Dr. Armstrong till Dr. Anderson admitted it into his edition of the *British Poets*. After the peace of 1763, Dr. Armstrong returned to London, and resumed his practice, but with no eager desire of increasing the moderate competency he now enjoyed. He continued after this period rather to amuse than to exert himself in literary productions, chiefly spending his time in the society of men of wit and taste like himself. In 1771 he made a tour into France and Italy, in company with the celebrated Fuseli, who survived him for nearly fifty years, and always spoke highly of Dr. Armstrong's amiable character. In Italy he took a tender farewell of his friend Smollett, to whom he was much attached, and who died soon after. On returning home he published an account of his travels, under the name of *Lancelot Temple*.

The latter years of Dr. Armstrong's life were embittered by one of those quarrels which, arising between persons formerly much attached, are at once the most venomous and the most productive of uneasiness to the parties. In his poem of *Day*, he had asked, among other things,

"What crazy scribbler reigns the present wit?"

which the poet Churchill very properly took to himself, and resented in the following passage in his poem of *The Journey*:—

"Let them with Armstrong, taking leave of sense,
Read musty lectures on *Benevolence*;
Or con the pages of his gaping *Day*.¹
Where all his former fame was thrown away,
Where all but barren labour was forgot,
And the vain stiffness of a lettered Scot;
Let them with Armstrong pass the term of light,
But not one hour of darkness: when the night
Suspends this mortal coil, when memory wakes,
When for our past misdoings conscience takes
A deep revenge, when by reflection led
She draws his curtains, and looks comfort dead,
Let every muse be gone; in vain he turns,
And tries to pray for sleep; an Etna burns,
A more than Etna in his coward breast,
And guilt, with vengeance armed, forbids to rest;
Though soft as plumeage from young Zephyr's wing,
His couch seems hard, and no relief can bring:
Ingratitude hath planted daggers there,
No good man can deserve, no brave man bear."

We have no hesitation in saying that this severe satire was not justified either by the offence which called it forth or by the circumstances on which it was founded. Wilkes, the associate of Churchill, had lent money to Armstrong on some occasion of peculiar distress. When the attacks of Wilkes upon Scotland led to animosities between the two friends, it was not to be expected that the recollection of a former obligation was necessarily to tie up the natural feelings of Dr. Armstrong, and induce him to submit rather to the certain charge of meanness of spirit, than the possible imputation of ingratitude. Neither could Wilkes have fairly expected that the natural course of the quarrel was to be stayed by such a submission on the part of his former friend. It would have been equally mean for the obliged party to have tendered, and for the obliging party to have accepted, such a submission. There can be no doubt, therefore, that Dr. Armstrong, in giving way to resentment against Wilkes, was chargeable, properly, with no blame except that of giving way to resentment; and if it is to be supposed, from the character of the poet in respect of irritability, that the resentment would have taken place whether there had been a debt of kindness standing undischarged between the parties or not, we cannot really see how this contingent circumstance can enhance his offence.

There is unfortunately too great reason to suppose, that if the obligation tended to increase the blame of either party, it was that of Wilkes, who, from almost incontestable evidence, appears to have made a most ungenerous use of the advantage he had acquired over his former friend. Not only must he bear a portion of the guilt of Churchill's satire, which could have only been written as a transcript of his feelings, and with his sanction, but he stands almost certainly guilty of a still more direct and scurrilous attack upon Dr. Armstrong, which appeared in a much more insidious form. This was a series of articles in the well-known *Public Advertiser*, commencing with a letter signed *Dica*, which appeared to proceed from an enemy of the patriot, but, in the opinion of Dr. Armstrong, was written by the patriot himself.

Armstrong died at his house in Russel Street, Covent Garden, September 7, 1779, in consequence of an accidental contusion in his thigh, received while getting into a carriage. He was found, to the surprise of the world, to have saved the sum of £2000 out of his moderate income, which for many

¹ This poem was full of large hiatus supplied by asterisks.

years had consisted of nothing more than his half-pay.

Dr. Armstrong was much beloved and respected by his friends for his gentle and amiable dispositions, as well as his extensive knowledge and abilities; but a kind of morbid sensibility preyed upon his temper, and a languid listlessness too frequently interrupted his intellectual efforts. With Thomson's *Castle of Indolence* he is appropriately connected, both as a figure in the piece and as a contributor to the verse. The following is his portraiture:—

With him was sometimes joined in silent walk
 (Profoundly silent—for they never spoke),
 One slyer still, who quite detested talk:
 Oft stung by spleen, at once away he broke,
 To groves of pine, and broad o'ershadowing oak,
 There, inly thrilled, he wandered all alone,
 And on himself his pensive fury wroke:
 He never uttered word, save, when first shone
 The glittering star of eve—"Thank heaven! the day is done!"

His contributions consist of four stanzas descriptive of the diseases to which the votaries of indolence finally become martyrs.

The rank of Dr. Armstrong as a poet is fixed by his *Art of Preserving Health*, which is allowed to be among the best didactic poems in the language. It is true this species of poetry was never considered among the highest, nor has it been able to retain its place among the tastes of a modern and more refined age. Armstrong, however, in having improved upon a mode of composition fashionable in his own time, must still be allowed considerable praise. "His style," according to the judgment of Dr. Aikin, "is distinguished by its simplicity—by a free use of words which owe their strength to their plainness—by the rejection of ambitious ornaments, and a near approach to common phraseology. His sentences are generally short and easy; his sense clear and obvious. The full extent of his conceptions is taken in at the first glance; and there are no lofty mysteries to be unravelled by a repeated perusal. What keeps his language from being prosaic, is the vigour of his sentiments. He thinks boldly, feels strongly, and therefore expresses himself poetically. When the subject sinks, his style sinks with it; but he has for the most part excluded topics incapable either of vivid description or of the oratory of sentiment. He had from nature a musical ear, whence his lines are scarcely ever harsh, though apparently without much study to render them smooth. On the whole, it may not be too much to assert, that no writer in blank verse can be found more free from stiffness and affectation, more energetic without harshness, and more dignified without formality."

ARNOT, HUGO, a historical and antiquarian writer of the eighteenth century, was the son of a merchant and ship-proprietor at Leith, where he was born, December 8th, 1749. His name originally was Pollock, which he changed in early life for Arnot, on falling heir, through his mother, to the estate of Balcormo in Fife. As "Hugo Arnot of Balcormo, Esq.," he is entered as a member of the Faculty of Advocates, December 5, 1772, when just about to complete his twenty-third year. Previous to this period he had had the misfortune to lose his father. Another evil which befell him in early life was a settled asthma, the result of a severe cold which he caught in his fifteenth year. As this disorder was always aggravated by exertion of any kind, it became a serious obstruction to his progress at the bar: some of his pleadings, nevertheless, were much admired, and obtained for him the applause of the bench. Perhaps it was this interruption of his pro-

fessional career which caused him to turn his attention to literature. In 1779 appeared his *History of Edinburgh*, 1 vol. 4to, a work of much research, and greatly superior in a literary point of view to the generality of local works. The style of the historical part is elegant and epigrammatic, with a vein of causticity highly characteristic of the author. From this elaborate work the author is said to have only realized a few pounds of profit; a piratical impression, at less than half the price, was published almost simultaneously at Dublin, and, being shipped over to Scotland in great quantities, completely threw the author's edition out of the market. A bookseller's second edition, as it is called, appeared after the author's death, being simply the remainder of the former stock, embellished with plates, and enlarged by some additions from the pen of the publisher, Mr. Creech. Another edition was published in 8vo, in 1817.

Mr. Arnot seems to have now lived on terms of literary equality with those distinguished literary and professional characters who were his fellow-townsmen and contemporaries. He did not, however, for some years, publish any other considerable or acknowledged work. He devoted his mind chiefly to local subjects, and sent forth numerous pamphlets and newspaper essays, which had a considerable effect in accelerating or promoting the erection of various public works. The exertions of a man of his public spirit and enlarged mind, at a time when the capital of Scotland was undergoing such a thorough renovation and improvement, must have been of material service to the community, both of that and of all succeeding ages. Such they were acknowledged to be by the magistrates, who bestowed upon him the freedom of the city. We are told that Mr. Arnot, by means of his influence in local matters, was able to retard the erection of the *South Bridge of Edinburgh* for ten years—not that he objected to such an obvious improvement on its own account, but only in so far as the magistrates could devise no other method for defraying the expense than by a tax upon carters; a mode of liquidating it which Mr. Arnot thought grossly oppressive, as it fell in the first place upon the poor. He also was the means of preventing for several years the formation of the present splendid road between Edinburgh and Leith, on account of the proposed plan (which was afterwards unhappily carried into effect) of defraying the expense by a toll; being convinced, from what he knew of local authorities, that, if such an exaction were once established, it would always, on some pretext or other, be kept up.

In 1785 Mr. Arnot published *A Collection of Celebrated Criminal Trials in Scotland, with Historical and Critical Remarks*, 1 vol. 4to; a work of perhaps even greater research than his *History of Edinburgh*, and written in the same acutely metaphysical and epigrammatic style. In the front of this volume appears a large list of subscribers, embracing almost all the eminent and considerable persons in Scotland, with many of those in England, and testifying of course to the literary and personal respectability of Mr. Arnot. This work appeared without a publisher's name, probably for some reason connected with the following circumstance. Owing perhaps to the unwillingness of the author to allow a sufficient profit to the booksellers, the whole body of that trade in Edinburgh refused to let the subscription papers and prospectuses hang in their shops; for which reason the author announced, by means of an advertisement in the newspapers, that these articles might be seen in the coffee-houses. Mr. Arnot received the sum of six hundred pounds for the copies

sold of this work, from which he would have to pay the expenses of printing a thin quarto: it thus happened that what was rather the least laborious of his two works was the most profitable.

Mr. Arnot only survived the publication of his *Criminal Trials* about a twelvemonth. The asthma had ever since his fifteenth year been making rapid advances upon him, and his person was now reduced almost to a shadow. While still young, he carried all the marks of age, and accordingly the traditionary recollections of the historian of Edinburgh always point to a man in the extreme of life. Perhaps nothing could indicate more expressively the miserable state to which Mr. Arnot was reduced by this disease, than his own half-ludicrous, half-pathetic exclamation, on being annoyed by the bawling of a man selling sand on the streets: "The rascal!" cried the unfortunate invalid, "he spends as much breath in a minute as would serve me for a month!" Among the portraits and caricatures of the well-known John Kay may be found several faithful, though somewhat exaggerated, memorials of the emaciated person of Hugo Arnot. As a natural constitutional result of this disease, he was exceedingly *nervous*, and liable to be discomposed by the slightest annoyances: on the other hand, he possessed such ardour and intrepidity of mind, that in youth he once rode on a spirited horse to the end of the pier of Leith, while the waves were dashing over it and every beholder expected to see him washed immediately into the sea! On another occasion, having excited some hostility by a political pamphlet, and being summoned by an anonymous foe to appear at a particular hour in a lonely part of the King's Park, in order to fight, he went and waited four hours on the spot, thus perilling his life in what might have been the ambushade of a deadly enemy. By means of the same fortitude of character he beheld the gradual approach of death with all the calmness of a Stoic philosopher. The magistrates of Leith had acknowledged some of his public services by the ominous compliment of a piece of ground in their churchyard; and it was the recreation of the last weeks of Mr. Arnot's life to go every day to observe the progress made by the workmen in preparing this place for his own reception. It is related that he even expressed considerable anxiety lest his demise should take place before the melancholy work should be completed. He died November 20th, 1786, when on the point of completing his thirty-seventh year; that age so fatal to men of genius that it may almost be styled their climacteric. He was interred in the tomb fitted up by himself at South Leith.

Besides his historical and local works, he had published, in 1777, a fanciful metaphysical treatise, entitled *Nothing*, which was originally a paper read before a well-known debating-club styled the Speculative Society; being probably suggested to him by the poem of the Earl of Rochester on the equally impalpable subject of *Silence*. If any disagreeable reflection can rest on Mr. Arnot's memory for the free scope he has given to his mind in this little essay—a freedom sanctioned, if not excused, by the taste of the age—he must be held to have made all the amends in his power by the propriety of his deportment in later life; when he entered heartily and regularly into the observances of the Scottish Episcopal communion, to which he originally belonged. If Mr. Arnot was anything decidedly in politics, he was a Jacobite, to which party he belonged by descent and by religion, and also perhaps by virtue of his own peculiar turn of mind. In modern politics he was quite independent, judging all men and all measures by no other standard than

their respective merits. In his professional character he was animated by a chivalrous sentiment of honour worthy of all admiration. He was so little of a casuist, that he would never undertake a case unless he were perfectly self-satisfied as to its justice and legality. He had often occasion to refuse employment which fell beneath his own standard of honesty, though it might have been profitable, and attended by not the slightest shade of disgrace. On a case being once brought before him, of the merits of which he had an exceedingly bad opinion, he said to the intending litigant, in a serious manner, "Pray, what do you suppose me to be?" "Why," answered the client, "I understand you to be a lawyer." "I thought, sir," said Arnot sternly, "you took me for a scoundrel." The litigant, though he perhaps thought that the major included the minor proposition, withdrew abashed. Mr. Arnot left eight children, all very young; and the talent of the family appears to have revived in a new generation, viz. in the person of his grandson, Dr. David Boswell Reid, whose *Elements of Chemistry* has taken its place amongst the most useful treatises on the science, and who was selected by government, on account of his practical skill, to plan and superintend the ventilation of the new houses of parliament, in the prosecution of which object he for several years conducted the most costly and prolonged, if not the most successful, experiment of the kind ever made.

AYTON, SIR ROBERT, an eminent poet at the court of James VI., was a younger son of Andrew Ayton of Kinaldie, in Fife, and was born in the year 1570. From the registers of St. Andrews university, it appears that he was incorporated or enrolled as a student in St. Leonard's College, December 3, 1584, and took his master's degree, after the usual course of study, in the year 1588. Subsequently to this, he resided for some time in France; whence, in 1603, he addressed an elegant panegyric in Latin verse to King James, on his accession to the crown of England, which was printed at Paris the same year; and this panegyric had no doubt some influence in securing to the author the favour of that monarch, by whom he was successively appointed one of the gentlemen of the bed-chamber, and private secretary to his queen, Anne of Denmark, besides receiving the honour of knighthood. He was, at a later period of his life, honoured with the appointment of secretary to Henrietta Maria, queen of Charles I. It is recorded on Ayton's funeral monument, as a distinction, that he had been sent to Germany as ambassador to the emperor, with a work published by King James, which is supposed to have been his *Apology for the Oath of Allegiance*. If this conjecture be correct, it must have been in 1609, when his majesty acknowledged a work published anonymously three years before, and inscribed it to all the crowned heads of Europe. During Ayton's residence abroad, as well as at the court of England, he lived in intimacy with and secured the esteem of the most eminent persons of the day. "He was acquainted," says Aubrey, "with all the wits of his time in England; he was a great acquaintance of Mr. Thomas Hobbes of Malmesbury, whom Mr. Hobbes told me he made use of, together with Ben Jonson, for an Aristarchus, when he made his epistle dedicatory for his translation of Thucydides." To this information we may add, as a proof of this respect on the part of Ben Jonson, that in his conversations with Drummond of Hawthornden, he said, "Sir Robert Ayton loved him (Jonson) dearly." Sir Robert Ayton died at London, in March, 1637-8, in the sixty-eighth year of his age. He lies

buried in the south aisle of the choir of Westminster Abbey, at the corner of King Henry V.'s Chapel, under a handsome monument of black marble, erected by his nephew, David Aytoun of Kinaldie; having his bust in brass gilt, which has been preserved, while that of Henry, the hero of Agincourt (said to have been of a more precious metal), has long since disappeared. The following is a copy of the inscription:

M. S.

Clarissimi omnigenaq. virtute et eruditione, præsertim Poesi ornatissimi equitis, Domini Roberti Aytoun, ex antiqua et illustri gente Aytouna, ad Castrum Kinnadiuin apud Scotos, oriundi, qui a Serenissimo R. Jacobo in Cubicula Interiora admissus, in Germaniam ad Imperatorem, Imperiique Principes cum libello Regio, Regiæ autoritatis vindice, Legatus, ac primum Annæ, demum Mariæ, serenissimis Britanniarum Reginis ab epistolis, consiliis et libellis supplicibus, nec non Xenodochio S^{re} Catherinæ præfectus. Anima Creatoris reddita, hic depositis mortalibus exuvias secundum Redemptoris adventum expectat.

Carolum linquens, repetit Parentem
Et valedecens Mariæ revisit
Annæ et Aulæ decus, alto Olympi
Mutat Honore.

Hoc devoti gratiæ animi
Testimonium optimo Patruo
Jo. Aytoun M L P.

Obiit Cælebs in Regio Albaula

Non sine maximo Honore omnium

Luctu et Mærore, Ætat. sævæ LXXIII.

Salut. Humane M.DCCXXXVIII.

MESARUM DECUS HIC, PATRIÆQ. AULÆQ. DOMIQUE
ET FORIS EXEMPLAR SED NON IMITABILE HONESTI.

The poems of Sir Robert Aytoun, for the first time published together in the *Miscellany of the Bannatyne Club* (from which we derive these particulars of the poet's life), are few in number, but of great merit. He composed no Scottish poems, at least none that have come down to our times. He wrote in English, and was, indeed, one of the first of our countrymen who composed in that language with any degree of elegance or purity. It is unfortunate that the most of his poems are complimentary verses to the illustrious individuals with whom he was acquainted, and of course characterized only by a strain of conceited and extravagant flattery. Those, however, upon general topics, are conceived in a refined and tender strain of fancy, that reminds us more of the fairy strains of Herrick than anything else. John Aubrey remarks, "that Sir Robert was one of the best poets of his time," and adds the more important testimony that "Mr. John Dryden has seen verses of his, *some of the best of that age*, printed with some other verses." According to Dempster, Aytoun was also a writer of verses in Greek and French, as well as in English and Latin. Several of his Latin poems are preserved in the work called *Delicia Poetarum Scotorum*, which was printed in his lifetime (1637) at Amsterdam.

AYTOUN, WILLIAM EDMONDSTOUNE. This recent poet, essayist, popular lecturer, and professor, who in each attained to considerable distinction, was born in June, 1813. His father was a writer to the signet, and was descended from an old and respectable family in Fifehire. The future professor was first educated at the Edinburgh Academy, where he was noted among his young compeers as an apt scholar; and afterwards at the university of Edinburgh, where he went through the usual curriculum. In this transit young Aytoun became the pupil of John Wilson, professor of moral philosophy, in whom he found a kindred spirit, and of whom he subsequently became the son-in-law and literary collaborator; and in this class he distinguished himself at the early age of eighteen by his prize poem entitled *Judith*. After finishing his course at college, Aytoun completed his studies in Germany, the liter-

ature of which country had afterwards considerable influence on the spirit of his own writings. On his return to Edinburgh he passed as a writer to the signet, but not finding this a congenial occupation, he turned to the Scottish bar, to which he obtained admission in 1840. As an advocate, however, he had little opportunity of being distinguished as an eloquent pleader, being chiefly employed as counsel in criminal cases. His fame was chiefly confined to the outer or parliament-house, where he was noted as one of the wits of the day, and an eminent member of that light-hearted talented party of lawyers who were the successors of the "stove school." But such talents as his could not be confined to impromptu sayings, and satisfied with the applause they created; and he produced for the principal magazines contributions, both in prose and verse, which indicated a writer of no mean powers. While a contributor to *Tait's Magazine*, he also, in conjunction with his friend Theodore Martin, commenced the *Bon Gualtier Ballads*, the best collection of that kind of poetry extant.

The literary talents of Aytoun, which were now generally recognized, obtained him, in 1839, a welcome admission among the contributors to *Blackwood's Magazine*; and in this distinguished periodical he soon found rivals to quicken his powers, as well as a sphere for their best exertions. It was there also that from time to time he published those stirring national odes which he afterwards gave to the world in a collective form, under the title of *Lays of the Scottish Cavaliers*. Like most young men of ardent feelings and literary acquirements, he at the commencement of life had entertained liberal sentiments in politics, which he afterwards saw fit to change; and this change, as is usually the case, was into a farther extreme on the opposite side than if he had been born and bred a Tory. The effects of this conversion are apparent in his *Lays*, where cavalier-devotedness in loyalty is as absolute as it is enthusiastic, and the conclusive unanswerable argument of which is, "Thus saith the king." Such Jacobitism, however, in the nineteenth century is so rare, and withal so harmless, that his extravagance may be pardoned on account of its singularity and its disinterestedness. But still more ardent than his Jacobitism was his enthusiastic Caledonian patriotism, that delighted to dwell upon the ancient remembrances of his country, and which made him conspicuous as the champion of a party that lived for a brief period, and whose great demand was the redress of Scottish grievances. But the poetic element of his *Lays of the Scottish Cavaliers* is animated and inspired by either feeling, so that while *The Heart of Bruce*, and *Edinburgh after Flodden*, are lyrics ennobled by the purest national devotedness, his *Burial March of Dundee*, and *Charles Edward at Versailles*, are all the more poetical from the fervour of the Jacobite spirit by which they are characterized. But it was not merely by his poetry that Aytoun became one of the most distinguished writers in *Blackwood*. His essays, dissertations, and tales in that magazine were equally popular; and few of its mirth-inspiring stories can compete with his *Glenmuthkin Railway*, or *How I became a Yeoman*. How assiduously and exclusively his literary exertions were devoted to this one periodical may be understood from the fact that, between the year 1839, when he first appeared in its pages, until 1865, the year of his death, he contributed more than 120 articles upon a great diversity of subjects, but all of them distinguished by some particular excellence.

While Aytoun was thus establishing a high literary reputation through a medium generally thought so

precarious and evanescent as that of magazine writing, the chair of rhetoric and *belles-lettres* in the university of Edinburgh became vacant, and to this professorship he was appointed in 1845. It was a great change in the literary life of one who had hitherto frolicked over the whole field of intellect, and regulated his choice of subjects by the mood of the passing hour. A systematic course of lectures was to be delivered; but this was not all—he must train young tyros to accurate thought and correct graceful composition, and bear with those blunders that set the teeth of a refined critic on edge. He must subject his pupils to daily oral examination, and revise their themes and essays pen in hand and with a patience all-enduring. But on the other hand, every department of his course was already familiar to his mind; in training the youthful intellect he could remember how his own had been matured; and while leading them by the same way, he could enjoy the luxury of living over again, and seeing himself reproduced anew in the pupils who walked in his steps. His assiduity, his patience, and his sympathy as a teacher, and the popularity and success with which they were crowned, very soon appeared. A chair which had hitherto been little regarded, became one of the most popular in the university; and his class-room, which at first comprised about thirty students, was at the close of his life attended by a hundred and fifty.

The other particulars of Aytoun's life may be briefly enumerated. In 1849 he married Jane, the youngest daughter of Professor Wilson, who died ten years after. In 1852, on account of the services he had rendered as a writer to their party, Lord Derby and his friends acknowledged their obligation by appointing him sheriff and vice-admiral of Orkney and Shetland; and the duties of these offices he carefully fulfilled, spending for the purpose a considerable portion of each summer in these islands. After four years of widowhood, he, in December,

1863, married Miss Kinnear, a near relative of his friends, the Balfours of Trennabie, in Orkney. As yet in the prime of life, a large amount of happiness was thought to be still in store for him: but in the winter of 1864 he sickened, his constitution was gradually undermined, and he died on the 4th of August, 1865.

During such varied activity of a literary life, and so prolific in its various productions, much that Mr. Aytoun wrote was upon subjects of political interest for the day, and therefore they have quietly dropped, or are dropping, out of notice. His tales, however, will always be appreciated as veritable pictures of human nature, and will show how high a place he would have occupied if he had devoted himself to this kind of literature. But it is as a poet that he will be best remembered, and his *Lays* and touching songs will be quoted when his political dissertations are forgot. While he lived, not the least of his literary distinctions arose from being supposed the editor of *Blackwood's Magazine*, and that in this office he succeeded his father-in-law, Professor John Wilson. But that both suppositions were entirely unfounded has been declared by official authority in the following intimation:—"It was erroneously supposed in some quarters that Mr. Aytoun occupied the position of editor of this magazine. Indeed, it seems difficult to persuade our friends at a distance of what is well known to those nearer at hand, that the proprietors of this magazine have never, since its commencement, now nearly half a century ago, devolved upon others the powers or responsibilities of an editor. To this system, perhaps, they owe it that the magazine has preserved a uniform consistency of aim and purpose; and that, while warm in its advocacy of great views and principles, it has avoided those petty partizanships and predilections from which it is so difficult for an ordinary editor to keep free."¹

B.

BAIKIE, WILLIAM BALFOUR, M.D., R.N. The field of African exploration, although the most difficult and deadly, has always been the favourite choice of Scottish travellers. And whence this peculiarity? It perhaps arises from the national character, which only becomes more resolute from opposition, and which scorns to succumb as long as there are dangers to surmount or difficulties to be overcome. Although almost every new path of African discovery contains the grave of some unfortunate Scottish explorer who died mid-way, the lonely hillock only animates some successor to accomplish what the other has left undone, instead of compelling him to pause and turn back. Among these martyrs of African discovery, the list for the present terminates with the name of Dr. William Balfour Baikie.

This lamented traveller was the son of Captain John Baikie, R.N., and was born at Kirkwall, Orkney, 1820. After an education at the grammar-school of his native town, he went to Edinburgh, studied medicine, and highly distinguished himself in the medical classes of the university. Having obtained the degree of M.D. he entered the royal navy as assistant-surgeon in March 15, 1848, and in this capacity served for some time in the *Volage*, a surveying vessel in the Mediterranean. But it was

in 1855 that he was introduced to his proper vocation, by being sent out on board the *Pleid* steamer as an accredited envoy of the British government, for the purpose of opening up the trade of the Niger, forming a trading settlement in the interior of Africa, and thus bringing the various Niger expeditions to a practical conclusion. It was while thus employed that the iron steamer *Day Spring* was lost in going through some of the rapids of the river; but this disaster, instead of discouraging Dr. Baikie, only made him more active and self-reliant. Having saved all he could from the wreck, he took up his abode with the wild African tribes, and followed out his duties as a government commissioner by exploring the country in every direction, and entering into binding engagements with the African chiefs and their people in relation to their traffic with the British. But while thus employed as a pioneer of commerce and civilization, and collecting vocabularies of the native languages for the purpose of facilitating the intercourse of Europeans with the natives, his supplies from home were exhausted, his horses died, and he soon found himself as bare and helpless as the most impoverished of our African travellers. Yet still zealous to prosecute his work,

¹ *Blackwood's Magazine* for September, 1865.

and another vessel, the *Sunbeam*, being sent to his relief, he settled at Lukoja, near the junction of the Chadda with the Niger. The account of it, given by Dr. Baikie in September, 1861, invests it with considerable mercantile importance. "The King of Nupe, the most powerful next to the Sultan of Sokoto, being desirous of seeing a market for European produce here, entered into relations with us, and undertook to open various roads for the passage of caravans, traders, and canoes in this place, which promise has been faithfully performed; I, on my part, giving him to understand that it was the desire of her majesty's government to have a trading station here. . . . I have started a regular market here, and have established the recognition of Sunday as a non-trading day, and the exclusion of slaves from our market. Already traders come to us from Kabbi, Kano, and other parts of Hausa; and we hope, ere long, to see regular caravans with ivory and other produce. The step I am taking is not lightly adopted. After a prolonged absence from England, to stay another season here without any Europeans, with only a faint prospect of speedy communication, and after all my experience of hunger and difficulty last year, is by no means an inviting prospect. But what I look to are the securing for England a commanding position in Central Africa, and the necessity of making a commencement."

The most serious difficulty which Dr. Baikie had encountered arose from the precarious character of his official position. In consequence of the loss of the *Fleiad* and other disasters, the foreign office in 1860 recalled the expedition to the Niger; but his unaided attempts had been so successful, and he had brought over so many African chiefs to his views by promises of British co-operation, that our government cancelled the recall, and ordered the expedition to be continued. Baikie was therefore enabled to continue the good work which he had commenced at his settlement of Lukoja; and after having seen it securely established, he craved leave of absence in October, 1863. The wish he expressed was to see his aged father, from whom he had been absent seven years. In June, 1864, the foreign office assented, in the hope that in the following year he would return to his African settlement; and Dr. Baikie, eager to revisit his native home, arrived at Lagos in October. Had he immediately embarked for England as he had at first intended, and as he announced to his expecting friends at home, his safety might have been insured. But the labour of arranging his African preparations occupied so much time, that the favourable opportunity was lost. Arriving at Sierra Leone, that place so fatal to European constitutions, he was attacked with illness which in two short days ended his adventurous career.

Such is the brief narrative of one whose travels and exertions in Africa would of themselves suffice to fill a whole volume of interesting biography. But it was not in action alone that his energies were expended. His earnest studies in a climate so enervating and exhausting, his extensive geographical and physiological observations, his contributions to scientific societies, and his copious correspondence, would of themselves furnish an amount of knowledge about the people, climate, and productions of the interior of Africa as would vastly enrich the storehouse of our African research. Nor were his labours less abundant in the African languages, so that his vocabularies of the Hausa, Pulo, and Fulfulde tongues comprise each of them between three and four thousand words. Out of so large a collection of manuscripts, and where there is so much excellence from which

to choose, we hope that a publication will be given as an enduring monument of the sterling worth of Dr. Baikie. This good work indeed is already in progress, his numerous journals descriptive of his travels and researches, now in the foreign office, having been placed in the hands of Dr. Kirk, the accomplished African traveller, for revision and arrangement. The printed communications of Dr. Baikie are comprised in the following short list:—*Despatches from — of the Niger Expedition relative to the Trade of that River, and to the Eligibility of Central Africa as a future Cotton-field.* Map. Folio, 1862. (Blue Book.)—*Report on the Geographical Position of the Countries in the neighbourhood of the Niger, &c.* Map. Folio, 1862.—*Observations on the Hausa and Fulfulde Languages.* Privately printed, Svo, 1862.—*Narrative of an Exploring Voyage up the Rivers Kwadra and Binue* (commonly known as the Niger and Tsada), in 1854: 8vo, 1856.

BAILLIE, JOANNA, authoress of *Plays on the Passions*, and various other dramatic works and poems, was born on September 11, 1762, in the manse of Bothwell in Lanarkshire. Her father, Dr. James Baillie, the minister of that parish, and subsequently professor of divinity in the university of Glasgow, sprang from a family allied to that of the celebrated Principal Robert Baillie, and likewise to that of the Baillies of Jerviswood, memorable in the history of Scotland. All these lines were derived from the ancient stem of the Baillies of Lamington. Her mother, also, was one of a race well known in Scottish heraldry, for she was descended from the Hunters of Hunterston, and was the sister of William and John Hunter, both renowned in the annals of science. The children, by the marriage of Dr. James Baillie with Miss Hunter, were Agnes; Matthew, afterwards the eminent physician; and Joanna, a twin—the other child being still-born.

The early youth of Joanna Baillie was passed among the romantic scenes of Bothwell, where every element existed to awaken the fancy of the poet; but when she had attained her sixth year the family removed to Hamilton, to the collegiate church of which place her father had been appointed minister. During her childhood Joanna Baillie was not remarkable for acquirement, yet, nevertheless, showed much originality and quickness of intellect. She made verses before she could read, and soon manifested dramatic talent. She took every opportunity of arranging among her young companions theatrical performances, in which her power of sustaining characters was remarkable, and she frequently wrote the dialogue herself. She was also conspicuous for fearlessness of disposition, which in after-years displayed itself in moral courage—a virtue often prominent in her conduct. Notwithstanding the decided tendency of her mind, she did not become an author till at a later period than is usual with those who are subject to the strong impulses of genius. In 1778 her father died; and in 1784, his widow, with her daughters, having lived for some years at Long Calderwood, near Hamilton, proceeded to London to reside with her son, who had there entered on his medical career, and who, upon the death of his uncle, Dr. William Hunter, had become possessed of the house in Great Windmill Street which the latter had built and inhabited.

It was in this abode that Joanna Baillie, in 1790, first resolved upon publishing, and the result was a small volume of miscellaneous poems, to which she did not affix her name. These evinced considerable talent, but not the power she afterwards manifested. In 1798 she gave to the world, also anonymously,

her first volume of dramas, in which the true bent of her genius was fully seen. This was entitled *A Series of Plays, in which it is attempted to Delineate the Stronger Passions of the Mind, each Passion being the subject of a Tragedy and a Comedy*, and these were accompanied by an introductory discourse of some length, in which dramatic composition was discussed, in which, also, many original views were announced, together with the peculiar system she proposed to adopt. Rich though the period was in poetry, this work made a great impression, and a new edition of it was soon required. The writer was sought for among the most gifted personages of the day, and the illustrious Scott, with others then equally appreciated, was suspected as the author. The praise bestowed upon *Basil and De Montfort* encouraged the authoress, and in 1802, she published another volume of plays on the *Passions*. Although much objection was made to the opinions she had enunciated in the preface to her first dramas, and though the criticism from an influential quarter was severe, she adhered to her purpose, and continued to write on the same plan which she had at first evoked; for, in 1812, she sent forth another volume of plays on the *Passions*, and in 1836, three more volumes of plays, containing some in prosecution of her primary design, which she thus completed, and some on miscellaneous subjects. Besides those above-mentioned, during the long period of her career she published various other dramas, and all her writings in this form exhibit great originality, power, and knowledge of human nature. Her works also are rich in imagery, and a pure and energetic strain of poetry pervades them. For the great effects she produced she was little indebted to study, of which her pages bear few indications. The characters she portrayed, the stories on which her plays were founded, and the management of them, proceeded almost entirely from her own invention. She was the authoress, also, of some poems, as well as songs, of high merit, among which may be especially mentioned those well-known favourite Scottish ones entitled "The bride, she is winsome and bonnie," and "It fell on a morning when we were thrang;" and the lyrical compositions scattered through her dramas are distinguished by their freshness and beauty. Some of her plays were represented on the stage, but without much success. Passion in them is forcibly and faithfully delineated, but without those startling and effective situations calculated to obtain theatrical triumph. Unmarried, and dwelling out of London, she had not those opportunities of frequenting the theatre which are necessary for the production of compositions popular in representation. It must be remembered, also, that female delicacy places a limit not only to the exuberance of passion, but also to the choice of subjects, which interfered both with the force and variety of her plays.

After Joanna Baillie had left Scotland, in 1784, she did not return to her native land except for occasional visits. Upon the marriage of her brother, in 1791, with Miss Denman, the sister of the Lord Chief-justice Denman, Joanna Baillie, with her mother and sister, passed some years at Colchester, but subsequently settled at Hampstead, near London, where she resided for more than half a century. Her mother died in 1806, and her sole companion during the remainder of her life was her sister, whose character, virtues, and claims upon the affections of the poetess are beautifully commemorated by her in an address to Miss Agnes Baillie on her birth-day. The means of Joanna Baillie were sufficient for every comfort, and enabled her to see many of the most distinguished individuals

the great metropolis contained, who, attracted by her high reputation, her perfect simplicity of manners, and the talent and shrewdness of her conversation, resorted freely to her home. Sir Walter Scott was one of her warmest friends and most ardent admirers, as many passages in his writings declare. Joanna Baillie was under the middle size, but not diminutive, and her form was slender. Her countenance indicated high talent, worth, and decision. Her life was characterized by the purest morality. Her principles were sustained by a strong and abiding sense of religion, while her great genius, and the engrossing pursuits of composition, never interfered with her active benevolence or the daily duties of life. She died in her house, in Hampstead, on the 23d day of February, 1851.

BAILLIE, MATTHEW, M.D., a distinguished modern physician and anatomist, was the son of the Rev. James Baillie, D.D., professor of divinity in the university of Glasgow. He was born October 27, 1761, in the manse of Shotts, of which parish his father was then minister. The father of Dr. Matthew Baillie was supposed to be descended from the family of Baillie of Jerviswood, so noted in the history of Scottish freedom; his mother was a sister of the two celebrated anatomists, Dr. William and Mr. John Hunter; and one of his two sisters was Miss Joanna Baillie, the well-known and amiable authoress of *Plays on the Passions*. After receiving the rudiments of his education under his father's immediate superintendence, he began his academical course in 1773, in the university of Glasgow, where he distinguished himself so highly as to be transferred, in 1778, upon Snell's foundation, to Baliol College, Oxford. Here, when he had attained the proper standing, he took his degrees in arts and physic. In 1780, while still keeping his terms at Oxford, he commenced his anatomical studies at London, under the care of his uncles. He had the great advantage of residing with Dr. William Hunter, and when he became sufficiently advanced in his studies, of being employed to make the necessary preparations for the lectures, to conduct the demonstrations, and to superintend the operations of the students. On the death of Dr. Hunter, March, 1783, he was found qualified to become the successor of that great man, in conjunction with Mr. Cruickshank, who had previously been employed as Dr. Hunter's assistant. His uncle appointed him by will to have the use of his splendid collection of anatomical preparations, so long as he should continue an anatomical lecturer, after which it was to be transferred to Glasgow College. Dr. Baillie began to lecture in 1784, and soon acquired the highest reputation as an anatomical teacher. He was himself indefatigable in the business of forming preparations, adding, it is said, no fewer than eleven hundred articles to his uncle's museum. He possessed the valuable talent of making an abstruse and difficult subject plain; his prelections were remarkable for that lucid order and clearness of expression which proceed from a perfect conception of the subject; and he never permitted any vanity of display to turn him from his great object of conveying information in the simplest and most intelligible way, and so as to become useful to his pupils. The distinctness of his elocution was also much admired, notwithstanding that he never could altogether shake off the accent of his native country. In 1795 Dr. Baillie embodied the knowledge he possessed through his own observations and those of his uncle in a small but most valuable work, entitled *The Morbid Anatomy of some of the most important Parts of the Human Body*, which was immediately translated

into French and German, and extended his name to every land where medical science was cultivated. The publication of this little treatise was, indeed, an era in the history of medical knowledge in this country. It combined all the information formerly scattered through the writings of Bonetus, Lieutaud, and Montagni, besides the immense store of observations made by the ingenious author. The knowledge of the changes produced on the human frame by disease had previously been very imperfect; but it was now so completely elucidated that, with the assistance of this little volume, any person previously acquainted with morbid symptoms, but unacquainted with the disease, could, upon an examination after death, understand the whole malady. Perhaps no production of the period ever had so much influence on the study of medicine, or contributed so much to correct unfounded speculations upon the nature of disease, to excite a spirit of observation, and to lead the attention of the student to fact and experience. Along with all its excellencies, it was delightful to observe the extreme modesty and total absence of pretension with which the author, in the fulness of his immense knowledge, ushered it into the world.

In 1787 Dr. Baillie had been elected physician to St. George's Hospital, a situation which afforded him many of those opportunities of observation upon which the success of his work on *Morbid Anatomy* was founded. In 1789, having taken his degree of M.D. at Oxford, he was admitted a candidate at the College of Physicians, and in the following year had the full privileges of fellowship conferred upon him. About the same time he was elected a fellow of the Royal Society, to which he had contributed two essays. He served the office of censor in the Royal College of Physicians, in 1792 and 1797, and that of commissioner under the act of parliament for the inspection and licensing of mad-houses in 1794 and 1795.

In 1799 Dr. Baillie relinquished the business of an anatomical lecturer, and in 1800 resigned his duties as physician to St. George's Hospital. Partly by the influence of his fame as an anatomist, and partly through the disinterested recommendations of several members of his own profession, he found himself gradually tempted into the less agreeable business of a general physician. He was always resorted to when more than ordinary scientific precision was required. About the year 1801, when he had attained the mature age of forty, he had become completely absorbed in practice. As a physician, he possessed, in an eminent degree, a facility in distinguishing diseases—one of the most important qualifications in the practice of medicine, as a want of accuracy in discriminating symptomatic from primary affections leads to the most serious errors; whilst it may be said that, when a disease is once distinctly characterized, and the peculiarities of the case defined, the cure is half performed. Habits of attentive observation had enabled Dr. Baillie to know, with great accuracy, the precise extent of the powers of medicine; indeed, there was no class of cases more likely to fall under his observation than those in which they had been abused, younger practitioners being apt to carry a particular system of treatment beyond its proper limits; Dr. Baillie's readiness, therefore, in seeing this abuse, rendered his opinions, in many cases, of great value. Yet he was always scrupulously anxious, through the natural benignity of his disposition, to use his knowledge with a delicate regard to the interests of those juniors whose procedure he was called upon to amend. He managed, indeed, this part of his practice with so much delicacy that he was held in the utmost affec-

tion and esteem by the younger branches of the profession.

Dr. Baillie was remarkable for forming his judgment of any case before him from his own observations exclusively; carefully guarding himself against any prepossessions from the opinions suggested by others. When he visited a patient, he observed him accurately, he listened to him attentively, he put a few pointed questions—and his opinion was formed. Beneath a most natural and unassuming manner, which was the same on all occasions, was concealed an almost intuitive power of perceiving the state of his patient. His mind was always quietly, but eagerly, directed to an investigation of the symptoms; and he had so distinct and systematic a mode of putting questions, that the answers of his patients often presented a connected view of the whole case. On such occasions, he avoided technical and learned phrases; he affected none of that sentimental tenderness which is sometimes assumed by a physician with a view to recommend himself to his patient; but he expressed what he had to say in the simplest and plainest terms; with some pleasantry if the occasion admitted of it, and with gravity and gentleness if they were required; and he left his patient either encouraged or tranquilized, persuaded that the opinion he had received was sound and honest, whether it was unfavourable or not, and that his physician merited his confidence. In delivering or writing his opinions he was equally remarkable for unaffected simplicity. His language was sometimes so plain, that his patients have been able to repeat to their other medical attendants every word which he had uttered. In consultation he gave his opinion concisely, and with a few grounds; those grounds being chiefly facts, rather than arguments, so that little room was left for dispute. If any difference or difficulty arose, his example pointed out the way of removing it, by an appeal to other facts, and by a neglect of speculative reasoning.

In every relation and situation of private life Dr. Baillie was equally to be admired; and it must be added, that the same liberal and just ideas which, on all occasions, guided his conduct as an individual, ruled him in his many public duties; he never countenanced any measures which had the appearance of oppression or hostility towards the members of his profession. Men seldom act, collectively, with the same honour and integrity as they would do individually; and a member of a public body requires an unusual share of moral courage, who opposes those measures of his associates which he may not himself approve of; but if there was one qualification more than another which gave Dr. Baillie the public confidence he enjoyed, and raised him to the zenith of professional distinction, it was his inflexible integrity.

In 1799 Dr. Baillie commenced the publication of *A Series of Engravings to illustrate some Parts of Morbid Anatomy*, in successive fasciculi, which were completed in 1802. The drawings for this splendid work were done by Mr. Clift, the conservator of the Hunterian Museum in Lincoln's Inn Fields; and they were creditable at once to the taste and liberality of Dr. Baillie, and to the state of art in that day. Dr. Baillie afterwards published *An Anatomical Description of the Gravid Uterus*; and throughout the whole course of his professional life, he contributed largely to the transactions and medical collections of the time. When he was at the height of his popularity, he enjoyed a higher income than any preceding physician, and which was only inferior to the sum received by one particular contemporary. In one of his busiest years, when he had scarcely

time to take a single meal, it is said to have reached £10,000. He was admitted to have the greatest *consultation business* of his time; and it was known that he was applied to for medical advice from many distant quarters of the world. From his arduous, and to his mind often irksome, duties, he enjoyed no relaxation for many years, till at length he began to indulge in an annual retirement of a few months to the country. On one of the first of these occasions he paid a visit to the land of his birth, which, during an absence of thirty years, spent in busy and distracting pursuits, he had never ceased to regard with the most tender feelings. The love of country was, indeed, a prominent feature in his character; and he was prepared on this occasion to realize many enjoyments which he had previously contemplated with enthusiasm, in the prospect of once more beholding the land and friends of his youth. The result was far different from his expectations. He found most of his early companions either scattered over the world, in search, as he himself had been, of fortune, or else forgotten in untimely graves; of those who survived, many were removed beyond his sympathies by that total alteration of feeling which a difference of worldly circumstances so invariably effects in the hearts of early friends, on the side of the depressed party as well as the elevated.

Dr. Baillie was introduced to the favourable notice of the royal family, in consequence of his treatment of the Duke of Gloucester. Being subsequently joined in consultation with the king's physicians upon his majesty's own unhappy case, he came more prominently than ever into public view, as in some measure the principal director of the royal treatment. The *political* responsibility of this situation was so very weighty, that, if Dr. Baillie had been a man of less firmness of nerve, he could scarcely have maintained himself under it. Such, however, was the public confidence in his inflexible integrity, that, amidst the hopes and fears which for a long time agitated the nation on the subject of the king's health, the opinion of Dr. Baillie ever regulated that of the public. On the first vacancy, which occurred in 1810, he was appointed one of the physicians to the king, with the offer of a baronetcy, which, however, his good sense and unassuming disposition induced him to decline.

Dr. Baillie at length sunk under the weight of his practice, notwithstanding that for several years he had taken every possible expedient to shift off his duties to the care of younger aspirants. At the last quarterly meeting of the College of Physicians before his death, when there was a full assemblage of members, in the midst of the affairs for the consideration of which they were called together, Dr. Baillie entered the room, emaciated, hectic, and with all the symptoms of approaching dissolution. Such was the effect of his sudden and unexpected appearance, that the public business was suspended, and every one present instantly and spontaneously rose, and remained standing until Dr. Baillie had taken his seat; the incident, though trivial, evinces the affectionate reverence with which he was regarded. Besides the natural claim he had upon this body, from his unapproached anatomical and medical skill, and the extraordinary benignity and worth of his character, he had entitled himself to its peculiar gratitude by leaving to it the whole of his valuable collection of preparations, together with the sum of £600 to keep it in order. Dr. Baillie died on the 23d of September, 1823.

Dr. Baillie had married, 5th May, 1791, Miss Sophia Denman, second daughter of Dr. Denman of London, a distinguished physician, and sister of

Mr., subsequently Lord Denman and Lord High-chancellor of England. By her he left one son, to whom he bequeathed his estate of Dantisbourne, in Gloucestershire; and one daughter. The sums and effects destined by his will, many of which were given to medical institutions and public charities, were sworn in the prerogative court at less than £80,000.

Dr. Baillie is thus characterized in the *Annual Obituary* for 1824:—"He seemed to have an innate goodness of heart, a secret sympathy with the virtuous, and to rejoice in their honourable and dignified conduct, as in a thing in which he had a personal interest, and as if he felt that his own character was raised by it as well as human nature ennobled. He censured warmly what he disapproved, from a strong attachment to what is right, not to display his superiority to others, or to give vent to any asperity of temper; at the same time he was indulgent to failings, his kindness to others leading him on many occasions to overlook what was due to himself; and even in his last illness he paid gratuitous professional visits which were above his strength, and was in danger of suddenly exhausting himself by exertions for others. His liberal disposition was well known to all acquainted with public subscriptions; the great extent to which it showed itself in private benefactions is known only to those who were nearly connected with him, and perhaps was fully known only to himself."

BAILLIE, ROBERT, one of the most eminent, and perhaps the most moderate, of all the Scottish Presbyterian clergy during the time of the civil war, was born at Glasgow in 1599. His father, Thomas Baillie, citizen, was descended from the Baillies of Lamington; his mother, Helen Gibson, was of the family of Gibson of Durie, both of which stocks are distinguished in Presbyterian history. Having studied divinity in his native university, Mr. Baillie in 1622 received episcopal orders from Archbishop Law of Glasgow, and became tutor to the son of the Earl of Eglintoune, by whom he was presented to the parish church of Kilwinning. In 1626 he was admitted a regent at the college of Glasgow, and, on taking his chair, delivered an inaugural oration *De Mentis Agente*. About this period he appears to have prosecuted the study of the oriental languages, in which he is allowed to have attained no mean proficiency. For some years he lived in terms of the strictest intimacy with the noble and pious family of Eglintoune, as also with his ordinary, Archbishop Law, with whom he kept up an epistolary correspondence. Baillie was not only educated and ordained as an Episcopalian; but he had imbibed from Principal Cameron of Glasgow the doctrine of passive resistance. He appears, however, to have been brought over to opposite views during the interval between 1630 and 1636, which he employed in discussing with his fellow-clergymen the doctrines of Arminianism, and the new ecclesiastical regulations introduced into the Scottish church by Archbishop Laud. Hence, in the year 1636, being desired by Archbishop Law to preach at Edinburgh in favour of the canon and service-books, he positively refused, writing, however, a respectful apology to his lordship. Endeared to the resisting party by this conduct, he was chosen to represent the presbytery of Irvine in the General Assembly of 1638, by which the royal power was braved in the name of the whole nation, and Episcopacy formally dissolved. In this meeting Baillie is said to have behaved with great moderation; a term, however, which must be understood as only comparative, for the expressions used in his

letter regarding the matters condemned are not what would now be considered moderate.

In the ensuing year, when it was found necessary to vindicate the proceedings of the Glasgow Assembly with the sword, Baillie entered heartily into the views of his countrymen. He accompanied the army to Dunse Law, in the capacity of preacher to the Earl of Eglington's regiment; and he it was who has handed down the well-known description of that extraordinary camp. "It would have done you good," he remarks in one of his letters, "to have cast your eyes athort our brave and rich hills, as oft as I did with great contentment and joy; for I was there among the rest, being chosen preacher by the gentlemen of our shire, who came late with Lord Eglington. I furnished to half a dozen of good fellows muskets and pikes, and to my boy a broadsword. I carried myself, as the fashion was, a sword, and a couple of Dutch pistols at my saddle; but I promise, for the offence of no man, except a robber in the way; for it was our part alone to pray and preach for the encouragement of our countrymen, which I did to my power most cheerfully" (*Letters*, vol. i. p. 174). He afterwards states, "Our soldiers grew in experience of arms, in courage, and favour daily. Every one encouraged another. The sight of their nobles and their beloved pastors daily raised their hearts. The good sermons and prayers, morning and evening, under the roof of heaven, to which their drums did call them for bells; the remonstrance very frequent of the goodness of their cause; of their conduct hitherto by a hand clearly divine; also Leslie's skill, and prudence, and fortune, made them as resolute for battle as could be wished. We were feared that emulation among our nobles might have done harm when they should be met in the field; but such was the wisdom and authority of that old, little, crooked soldier, that all, with an incredible submission, from the beginning to the end, gave over themselves to be guided by him, as if he had been great Solymán. Had you lent your ear in the morning, or especially at even, and heard in the tents the sound of some singing psalms, some praying, and some reading the Scripture, ye would have been refreshed. True, there was swearing, and cursing, and brawling, in some quarters, whereat we were grieved; but we hoped, if our camp had been a little settled, to have gotten some way for these misorders; for all of any fashion did regret, and all promised to do their best endeavours for helping all abuses. For myself, I never found my mind in better temper than it was all that time since I came from home, till my head was again homeward; for I was as a man who had taken my leave from the world, and was resolved to die in that service without return." This expedition ended in a treaty between the Scottish leaders and their sovereign, in terms of which hostilities ceased for a few months. On the renewal of the insurrectionary war next year, Baillie accompanied the Scottish army on its march into England, and became the chronicler of its transactions. Towards the end of the year 1640 he was selected by the Scottish leaders as a proper person to go to London, along with other commissioners, to prepare charges against Archbishop Laud for his innovations upon the Scottish church, which were alleged to have been the origin of the war. He had, in April, before the expedition, published a pamphlet entitled *Ladenium Avokarakpous: the Canterburian's Self-conviction; or an Evident Demonstration of the Avowed Arminianisme, Poperie, and Tyrannie of that Faction, by their own Confessions*, which perhaps pointed him out as fit to take a lead in the prosecutions of the great Antichrist of Scottish Presbytery.

Of this and almost all the other proceedings of his public life he has left a minute account in his letters and journals, which are preserved entire in the archives of the Church of Scotland, and in the university of Glasgow, and of which excerpts were published in 2 vols. 8vo, Edinburgh, 1775. They were afterwards published in their entire form by the Bannatyne Club, in 3 vols. 4to, in 1841. These reliques of Mr. Baillie form valuable materials of history.

Not long after his return to his native country, in 1642, he was appointed joint-professor of divinity at Glasgow, along with Mr. David Dickson, an equally distinguished, but less moderate, divine. It affords some proof of the estimation in which he was now held, that he had the choice of this appointment in all the four universities of Scotland. He performed his duties from this period till the Restoration, and at the same time attended all the General Assemblies as a member, except during an interval in 1643-6, when he was absent as a delegate to the Westminster assembly of divines. In this latter capacity he conducted himself in an unobtrusive manner, but fully concurred in the principles and views of the more prominent men. It is observable from his letters that, with the pardonable earnestness of his age and party, he looked upon toleration as a thing fatal to religion, and strenuously asserted the divine right of the Presbyterian church to be established in complete ascendancy and power as a substitute for the Church of England. From 1646 to 1649 he discharged his ordinary duties as a theological teacher without taking a leading part in public affairs. But in the latter year he was chosen by the church as the fittest person to carry its homage to King Charles II. at the Hague, and to invite that youthful monarch to assume the government in Scotland, under the limitations and stipulations of the covenant. This duty he executed with a degree of dignity and propriety which could have been expected from no member of his church but one, who, like him, had spent several years in conducting high diplomatic affairs in England. Indeed, Mr. Baillie appears in every transaction of his life to have been an accomplished man of the world, and yet retaining, along with habits of expediency, the most perfect sincerity in his religious views. When the necessary introduction of the malignants into the king's service caused a strong division in the church in 1651, Baillie, as might have been expected from his character and former history, sided with the yielding or Resolutionist party, and soon became its principal leader. On this account he and many other sincere men were charged by the Protesting and less worldly party with a declension from the high principles of the covenant, a charge to which he, at least, certainly was not liable. After the Restoration, though made principal of his college through court patronage, he scrupulously refused to accept a bishopric, and did not hesitate to express his dissatisfaction with the re-introduction of Episcopacy. His health now declining, he was visited by the new-made archbishop, to whom he thus freely expressed himself: "Mr. Andrew," said he, "I will not now call you my lord. King Charles would have made me one of these lords; but I do not find in the New Testament that Christ has any lords in his house." He considered this form of religion and ecclesiastical government as "inconsistent with Scripture, contrary to pure and primitive antiquity, and diametrically opposed to the true interest of the country." He died, July, 1662, in the sixty-third year of his age.

Mr. Baillie, besides his *Letters and Journals*, and a variety of controversial pamphlets, suitable to the spirit of the times, was the author of a respectable

and learned work, entitled *Opus Historicum et Chronologicum*, which was published in folio at Amsterdam. He was a man of extensive learning—understood no fewer than thirteen languages, among which were Hebrew, Chaldee, Syriac, Samaritan, Arabic, and Ethiopic—and wrote Latin with almost Augustine elegance. He left a large family; one of his daughters becoming the wife of Walkinshaw of Barrowfield, was, by a strange chance, the ancestress of Miss Clementina Walkinshaw, well known from her connection with the history of Prince Charles Stuart—and also grandmother to the celebrated Henry Home, better known under the judicial designation of Lord Kames.

BAILLIE, ROBERT, of Jerviswood, an eminent patriot of the reign of Charles II., was the son of George Baillie, of St. John's Kirk in Lanarkshire, cadet of the ancient family of Baillie of Lamington, who appears to have purchased the estate of Jerviswood, also in Lanarkshire, in the reign of Charles I., from a family of the name of Livingstone. It is stated by the Jacobite, Robert Mylne, in the publication called *Fountainhall's Notes*, that the first circumstance which alienated the mind of Robert Baillie from the government was his marrying a daughter of Sir Archibald Johnstone of Warristoun, who, having borne a conspicuous part in the civil war from the beginning, was executed after the Restoration. Whatever be the truth of this allegation, Baillie appears before the year 1676 to have been otherwise allied to the nonconformist party.

The incident which first brought him forward into view as a subject of persecution was one of those interferences in behalf of natural justice, where all sense of consequences is overcome by the exigency of the occasion. During the misgovernment of the Duke of Lauderdale, a wretched profligate of the name of Carstairs had bargained with Archbishop Sharpe to undertake the business of an informer upon an uncommonly large scale, having a troop of other informers under him, and enjoying a certain reward for each individual whom he could detect at the conventicles, besides a share of the fines imposed upon them. It may be supposed that an individual who could permit himself to enter upon a profession of this kind would not be very scrupulous as to the guilt of the persons whom he sought to make his prey. He accordingly appears to have, at least in one noted instance, pounced upon an individual who was perfectly innocent. This was the Rev. Mr. Kirkton, a nonconformist minister it is true, but one who had been cautious to keep strictly within the verge of the law. Kirkton was the brother-in-law of Mr. Baillie of Jerviswood by his marriage to the sister of that gentleman; and he is eminent in Scottish literary history for a memoir of the church during his own times, which was of great service in manuscript to the historian Wodrow, and was at length published in 1817. One day in June, 1676, as Mr. Kirkton was walking along the High Street of Edinburgh, Carstairs, whose person he did not know, accosted him in a very civil manner, and expressed a desire to speak with him in private. Mr. Kirkton, suspecting no evil, followed Carstairs to a very mean-looking house, near the common prison. Carstairs, who had no warrant to apprehend or detain Mr. Kirkton, went out to get one, locking the door upon his victim.¹ The unfortunate clergyman then perceived that he was in some danger, and prevailed upon a person in the house to go to seek his brother-in-law, Mr. Baillie, and apprise him of his

situation. Carstairs, having in vain endeavoured to get the requisite number of privy-councillors to sign a warrant, now came back, resolved, it appears, to try at least if he could not force some money from Mr. Kirkton for his release. Just as they were about to confer upon this subject, Mr. Baillie came to the door, with several other persons, and called to Carstairs to open. Kirkton, hearing the voices of friends, took courage, and desired his captor either to set him free, or to show a warrant for his detention. Carstairs, instead of doing either, drew a pocket-pistol, and Kirkton found it necessary, for his own safety, to enter into a personal struggle, and endeavour to secure the weapon of his antagonist. The gentlemen without, hearing a struggle and cries of murder, burst open the door, and found Carstairs sitting upon Mr. Kirkton on the floor. Baillie drew his sword, and commanded the poltroon to come off, asking him at the same time if he had any warrant for apprehending Mr. Kirkton. Carstairs said he had a warrant for conducting him to prison, but he utterly refused to show it, though Mr. Baillie said that if he saw any warrant against his friend, he would assist in carrying it into execution. The wretch still persisting in saying he had a warrant, but was not bound to show it, Mr. Baillie left the place with Mr. Kirkton and other friends, having offered no violence whatever to Carstairs, but only threatened to sue him for unlawful invasion of his brother-in-law's person.

It might have been expected from even a government so lost to all honour and justice as that which now prevailed in Scotland, that it would have had at least the good sense to overlook this unhappy accident to one of its tools. On the contrary, it was resolved to brave the popular feeling of right, by listening to the complaints of Carstairs. Through the influence of Archbishop Sharpe, who said that, if Carstairs was not countenanced, no one would be procured to apprehend fanatics afterwards, a majority of the council agreed to prosecute Baillie, Kirkton, and the other persons concerned. For this purpose, an antedated warrant was furnished to Carstairs, signed by nine of the councillors. The Marquis of Atholl told Bishop Burnet that he had been one of the nine who lent their names to this infamous document. The whole case was therefore made out to be a tumult against the government; Baillie was fined in six thousand merks (£318 sterling),² and his friends in smaller sums, and to be imprisoned till they should render payment.

This award was so opposite, in every particular, to the principles of truth, honour, and justice, that, even if not directed against individuals connected with the popular cause, it could not have failed to excite general indignation. It appears that a respectable minority of the council itself was strongly opposed to the decision, and took care to let it be known at court. Mr. Baillie was therefore released at the end of four months, in consideration of payment of one-half of his fine to the creature Carstairs. Lord Halton, however, who was at this time a kind of pro-regent under his brother Lauderdale, had interest to obtain the dismissal of his opponents from the council, namely, the Duke of Hamilton, the Earls of Morton, Dumfries, and Kincardine, and the Lords Cochrane and Primrose, whom he branded, for their conduct on this occasion, as enemies to the church and favourers of conventicles.

After this period nothing is known of Mr. Baillie till the year 1683, when he is found taking a prominent share in a scheme of emigration, agitated by a

¹ Burnet. Wodrow's account is slightly different.

² Wodrow says £500 sterling, new edit. v. ii, p. 328.

number of Scottish gentlemen, who saw no refuge but this from the tyranny of the government. These gentlemen entered into a negotiation with the patentees of South Carolina, for permission to convey themselves thither, along with their families and dependants. While thus engaged, Mr. Baillie was induced, along with several of his friends, to enter into correspondence and counsel with the heads of the Puritan party in England, who were now forming an extensive plan of insurrection, for the purpose of obtaining a change of measures in the government, though with no ulterior view. Under the pretext of the American expedition, Lord Melville, Sir John Cochrane of Ochiltree, Mr. Baillie, and three others, were invited and repaired to London, to consult with the Duke of Monmouth, Sydney, Russell, and the rest of that party. This scheme was never properly matured; indeed, it never was anything but a matter of talk, and had ceased to be even that, when a minor plot for assassinating the king, to which only a small number of the party were privy, burst prematurely, and involved several of the chiefs, who were totally ignorant of it, in destruction. Sydney and Russell suffered for this crime, of which they were innocent; and Baillie and several other gentlemen were seized and sent down to be tried in Scotland.¹

The subsequent judicial proceedings were characterized by the usual violence and illegality of the time. Baillie endured a long confinement, during which he was treated very harshly, and not permitted to have the society of his lady, though she offered to go into irons, as an assurance against any attempt at facilitating his escape. An attempt was made to procure sufficient proof of guilt from the confessions wrought out of his nephew-in-law, the Earl of Tarras (who had been first married to the elder sister of the Duchess of Monmouth); but, this being found insufficient, his prosecutors were at last obliged to adopt the unlawful expedient, too common in those distracted times, of putting him to a purgative oath. An accusation was sent to him, not in the form of an indictment, nor grounded on any law, but on a letter of the king, in which he was charged with a conspiracy to raise rebellion, and a concern in the Rye-house Plot. He was told that, if he would not clear himself of these charges by his oath, he should be held as guilty, though not as in a criminal court, but only as before the council, who had no power to award a higher sentence than fine and imprisonment. As he utterly refused to yield to such a demand, he was fined by the council in £6000, being about the value of his whole estates. It was then supposed that the prosecution would cease, and that he would escape with the doom of a captive. For several months he continued shut up in a loathsome prison, which had such an effect upon his health that he was brought almost to the last extremity. Yet "all the while," to use the words of Bishop Burnet,² "he seemed so composed, and even so cheerful, that his behaviour looked like a reviving of the spirit of the noblest of the old Greeks or Romans, or rather of the primitive Christians and first martyrs in those last days of the church." At length, on the 23d of December, 1684,

he was brought before the court of judicary. He was now so weak as to be obliged to appear at the bar in his night-gown, and take frequent applications of cordials, which were supplied to him by his sister, the wife of Mr. Ker of Graden. The only evidence that could be produced was the confessions forced from his friends by torture, one of whom, the Rev. Mr. Carstairs, afterwards the distinguished principal of the Edinburgh university, had only emitted a declaration, on an express promise that no use was to be made of it. Mr. Baillie solemnly denied having been accessory to any conspiracy against the king's life, or being unfavourably disposed to monarchical government. He complained that his friends had been forced to bring forth untrue representations against him. Indeed, there can be no doubt that the whole extent of his offence was a *desire* to procure some amelioration of the measures, and not any change of the members of the government; we say *desire*, because it never could be proved that a single step had been taken in the matter, nor is there the least probability that it would have ever been heard of, but for the trials of several innocent persons.

A cavalier and contemporary writer has alleged that Mr. Baillie conducted himself on his trial in a very haughty and scornful manner—"very huffy and proud" is the expression used—but this probably is only the colour given by a political enemy to the Roman dignity which Burnet saw in his behaviour. After the evidence had been adduced, and when the lord-advocate had ended his charge, the following remarkable dialogue took place between him and that officer:—

"My lord, I think it very strange that you charge me with such abominable things; you may remember that when you came to me in person, you told me that such things were laid to my charge, but that you did not believe them. How then, my lord, did you come to lay such a stain upon me with so much violence? Are you now convinced in your conscience that I am more guilty than before? You may remember what passed betwixt us in prison."

The whole audience fixed their eyes upon the advocate, who appeared in no small confusion, and said,

"Jerviswood, I own what you say. My thoughts there were as a private man; but what I say here is by special direction of the privy-council. And," pointing to Sir William Paterson, clerk, "he knows my orders."

"Well," said Baillie, "if your lordship have one conscience for yourself, and another for the council, I pray God forgive you; I do. My lords," he added, "I trouble your lordships no further."

The assize was empannelled at midnight, and sat till nine in the morning of the succeeding day, when a verdict of guilty was returned against Mr. Baillie, and he was sentenced to be executed that afternoon at the cross, and his limbs to be afterwards exhibited on the jails of four different Scottish towns. The reason for such precipitation was the fear of his judges that a natural death would disappoint the wishes of the government, which called imperatively at this moment for a public example to terrify its opponents. Baillie only said, "My lords, the time is short, the sentence is sharp, but I thank my God, who hath made me as fit to die as you are to live." On returning to the prison he experienced what Wodrow describes as "a wonderful rapture of joy, from the assurance he had that in a few hours he should be inconceivably happy."

Mr. Baillie was attended to the scaffold by his faithful and affectionate sister. He had prepared an

¹ Mr. Rose, in his *Observations on Mr. Fox's History*, relates that the hope of a pardon being held out to him, on condition of his giving information respecting some friends supposed to be engaged with him, his answer was, "They who can make such a proposal to me neither know me nor my country;" an expression of which the latter part is amply justified by fact, for, as Lord John Russell has justly observed, in his *Memoirs of Lord William Russell*, "It is to the honour of Scotland, that [on this occasion] no witnesses came forward voluntarily to accuse their associates, as had been done in England."

² Burnet, being the nephew of Sir Archibald Johnstone, was cousin by marriage to Mr. Baillie.

address to the people; but knowing that he might be prevented from delivering it, he had previously given it to his friends in writing. It is said that the government afterwards offered to give up his body for burial, if his friends would agree to suppress this document. They appear to have rejected the proposition. The unfortunate gentleman was so weak that he required to be assisted in mounting the ladder: he betrayed, however, no symptom of moral weakness. Just before being consigned to his fate, he said, in the self-accusing spirit of true excellence, "Aly faint zeal for the Protestant religion has brought me to this end." His sister-in-law, with the stern virtue of her family, waited to the last.

"Thus," says Bishop Burnet, "a learned and worthy gentleman, after twenty months' hard usage, was brought to death, in a way so full, in all the steps of it, of the spirit and practice of the courts of inquisition, that one is tempted to think that the methods taken in it were suggested by one well studied, if not practised, in them. The only excuse that ever was pretended for this infamous prosecution was, that they were sure he was guilty; and that the whole secret of the negotiation between the two kingdoms was intrusted to him; and that, since he would not discover it, all methods might be taken to destroy him. Not considering what a precedent they made on this occasion, by which, if they were once possessed of an ill opinion of a man, they were to spare neither artifice nor violence, but to hunt him down by any means."

Dr. Owen has testified in a strong manner to the great abilities of the Scottish Sydney. Writing to a Scottish friend, he said, "You have truly men of great spirits among you; there is, for a gentleman, Mr. Baillie of Jerviswood, a person of the greatest abilities I ever almost met with."

Mr. Baillie's family was completely ruined by his forfeiture. He left a son, George Baillie, who, after his execution, was obliged to take refuge in Holland, whence he afterwards returned with the Prince of Orange, by whom he was restored to his estates. The wife of this gentleman was Miss Grizel Hume, daughter of Sir Patrick Hume of Polwarth, a fellow-patriot of Mr. Robert Baillie. The occasion of their meeting was very remarkable. Miss Grizel, when a very young girl, was sent by her father from the country, to endeavour to convey a letter to Mr. Baillie in prison, and bring back what intelligence she could. She succeeded in this difficult enterprise; and having at the same time met with Mr. Baillie's son, the intimacy was formed, which was afterwards completed by their marriage.

BAIRD, THE RIGHT HONOURABLE GENERAL. SIR DAVID, a distinguished commander during the wars of the French revolution, was the second surviving son of William Baird, Esq., heir, by settlement, of his second cousin, Sir John Baird of Newbyth, Bart. He entered the army, December 16, 1772, as an ensign in the 2d foot, joined the regiment at Gibraltar, April, 1773, and returned to Britain in 1776. Having been promoted to a lieutenancy in 1778, he immediately after obtained a company in the 73d, a regiment then just raised by Lord Macleod, with which he sailed for India, and arrived at Madras, January, 1780.

This young regiment was here at once ushered

into the trying and hazardous scenes of the war against Hyder Ali, whom the English Company had provoked by a shameful breach of faith into a hostility that threatened to overwhelm it. In July, 1780, while the Company, exclusive of Lord Macleod's regiment, had only about 5000, men under arms, Hyder burst into the Carnatic with an army of 100,000 men, disciplined and commanded by French officers, and laid siege to Arcot, the capital of the only native prince friendly to the British. Sir Hector Munro, commander-in-chief of the Company's troops, set out to relieve this city on the 25th of August, expecting to be joined on the 30th by a large detachment then in the Northern Circars under Colonel Baillie. On learning this movement Hyder left Arcot, and threw himself in the way of Colonel Baillie. In order to favour, if possible, the approach of this officer, Sir Hector Munro, on the 5th of September, changed his position a little, and advanced two miles on the Trepasore road, which brought him within a short distance from the enemy. Hyder then detached his brother-in-law Meer Saib, with 8000 horse, to attack Colonel Baillie, and afterwards an additional force of 6000 infantry, 18,000 cavalry, and twelve pieces of cannon, under his son the celebrated Tippoo. He at the same time made demonstrations on his front, to keep up the attention of Sir Hector and the main army. Baillie, though commanding no more than 2000 sepoys and a few European companies, gained a complete victory over the immense force sent against him, but at the same time sent word to Sir Hector that, unless provision were made for accomplishing a junction, he must certainly be cut off. The commander-in-chief held a council of war, when it was determined at all hazards to send a reinforcement, for the purpose of achieving the relief of this gallant officer. A small force was selected, consisting principally of the grenadier and infantry companies of Lord Macleod's regiment, which, having received strict injunctions as to the necessity of a secret and expeditious march, set off towards Colonel Baillie's position, under the command of Colonel Fletcher and Captain Baird. Hyder Ali had secret intelligence of this movement, and sent a detachment to cut it off; but Colonel Fletcher and Captain Baird, having fortunately conceived some suspicion of their guides, suddenly altered their line of march, and were thereby enabled to gain their point. Hyder was determined that Colonel Baillie, with his friends, should not advance so safely to the main army. He therefore, with the most consummate ability, and under his own personal inspection, prepared an ambuscade at a particular pass through which they would have to march. This part of the road he had occupied and enfiladed with several batteries of cannon, behind which lay large bodies of his best foot, while he himself, with almost his whole force, was ready to support the attack. While these real dispositions were made, a cloud of irregular cavalry was employed in several motions on the side of Conjeveram, in order to divert the attention of the English camp.

The morning of the 10th of September had scarcely dawned, when the silent and expectant enemy perceived Colonel Baillie's little army advancing into the very toils planted to receive it. The ambuscade reserved their fire with admirable coolness and self-command, till the unhappy English were in the midst of them. The army marched in column. On a sudden, while in a narrow defile, a battery of twelve guns poured a storm of grape-shot into their right flank. The English faced about; another battery immediately opened on their rear. They had no alternative, therefore, but to

¹ "The Lady Graden, with a more than masculine courage, attended him on the scaffold till he was quartered, and went with the hangman and saw his quarters sodden, oyled, &c." (*Fountainhall's Notes*, 117, 118). It is scarcely possible for an individual accustomed to the feelings of modern society to believe such a statement.

advance; other batteries met them here likewise, and in less than half an hour 57 pieces of cannon were so brought to bear on them as to penetrate into every part of the British line. By seven o'clock in the morning the enemy poured down upon them in thousands, and every Englishman in the army was engaged. Captain Baird, at the head of his grenadiers, fought with the greatest heroism. Surrounded and attacked on all sides by 25,000 cavalry, by 30 regiments of sepoy infantry, besides Hyder Ali's European corps, and a numerous artillery playing upon them from all quarters within grape-shot distance, yet this heroic column stood firm and undaunted, alternately facing their enemies on every side of attack. The French officers in Hyder's camp beheld the scene with astonishment, which was increased when, in the midst of all this tumult and extreme peril, they saw the British grenadiers performing their evolutions with as much precision, coolness, and steadiness, as if under the eyes of a commander on a parade. At length, after a dubious contest of three hours (from six in the morning till nine), victory began to declare for the English, when an unlucky accident altered the fortune of the day. The tumbrils containing the ammunition suddenly blew up, with two dreadful explosions, in the centre of the British line. The whole face of their column was laid open, and their artillery overturned and destroyed. Tippoo Saib instantly seized the moment of advantage, and, without waiting for orders, fell with the Mogul and Carnatic horse into the broken square, which had not yet time to form anew. This attack by the enemy's cavalry being immediately seconded by the French corps, and by the first line of infantry, determined at once the fate of our unfortunate army. Out of 4000 sepoys and 800 Europeans who had commenced this engagement, only about 200 of the latter survived. Colonel Fletcher was among the slain, and Captain Baird was wounded in four places. When he and Colonel Baillie, with other captive officers, were taken before Hyder Ali, the latter gentleman said to the barbarous chief, "Your son will inform you that you owe the victory to our disaster, rather than to our defeat." Hyder angrily ordered them from his presence, and commanded them instantly to prison. The slaughter among the Mysore troops was very great, amounting, it is said, to three times the whole British army. When Sir Hector Munro learned the unhappy fate of his detachment, he found it necessary to retreat to Madras.

Captain Baird, with the officers, remained in a dungeon in one of Hyder's forts for three days and a half; he was chained by the leg to another prisoner, as much of the slaughter in Hyder's army was attributed to the grenadiers. At length, in July, 1784, he was released and joined his regiment at Arcot. In 1787 he removed with his regiment (now styled the 71st) to Bombay, and returned to Madras next year. On the 5th of June, 1789, he received the majority of the 71st, and in October obtained leave of absence, and returned to Britain. In 1791 he returned as lieutenant-colonel of the 71st, and joined the army under the Marquis Cornwallis. As commander of a brigade of sepoys, he was present at the attack of a number of droogs, or hill-forts, and at the siege of Seringapatam, in 1791 and 1792; and likewise at the storming of Tippoo Sultaun's lines and camps in the island of Seringapatam. In 1793 he commanded a brigade of Europeans, and was present at the siege of Pondicherry. He received a colonelcy in 1795. In October, 1797, he embarked at Madras with his regiment for Europe; in December, when he arrived

at the Cape of Good Hope, he was appointed brigadier-general, and placed on that staff, in command of a brigade. June 18, 1798, he was appointed major-general, and returned to the staff in India. In January, 1799, he arrived at Madras, in command of two regiments of foot, together with the drafts of the 28th dragoons. May 4, he commanded the storming party at that distinguished action the assault of Seringapatam; when, in requital of his brilliant services, he was presented by the army, through the commander-in-chief, with the state sword of Tippoo Sultaun, and also with a dress-sword from the field-officers serving under his immediate command at the assault.

The eminent merit of Brigadier-general Baird was now fully known and acknowledged by the government at home. He was therefore, in 1800, appointed to the command of an expedition against Batavia, but which was afterwards sent to Egypt. He landed at Coscir in June, crossed the desert, and, embarking on the Nile, descended to Grand Cairo; whence he set out for Alexandria, which he reached a few days before it surrendered to General Hutchison. Next year he led the Egyptian-Indian army overland to India, where he was concerned in various military transactions. His services, however, being soon after superseded by Sir Arthur Wellesley (afterwards the illustrious protector of Europe), he sailed for Britain with his staff, March, 1803, and after a tedious voyage, during which he was taken prisoner by a French privateer, but afterwards retaken, he arrived in England in November.

Sir David Baird was received at the British court with great distinction. In December he received the royal permission to wear the Turkish order of the Crescent. In June, 1804, he received the honour of knighthood; and on the 18th of August following became a knight-companion of the Bath. With the increased rank of lieutenant-general he commanded an expedition which sailed in October, 1805, for the Cape of Good Hope. Landing there, January 6, 1806, he attacked and beat the Dutch army, and on the 18th received the surrender of the colony. Being recalled, he arrived in Britain, April, 1807, and was shifted from the colonelcy of the 54th, which he had held for some years, to that of the 24th, and placed on the foreign staff under General Lord Cathcart. He commanded a division at the siege of Copenhagen, where he was twice slightly wounded; and returned with the army in November.

After a short period of service in Ireland, Sir David sailed in command of an armament of 10,000 men for Corunna, where he arrived in November, 1808, and formed a junction with the army under General Sir John Moore. He commanded the first division of that army, and in the battle of Corunna, January 16, 1809, he lost his left arm.

By the death of Sir John Moore in this action, Sir David succeeded to the chief command, and had the honour of communicating intelligence of the victory to government. On this occasion he received, for the fourth time in his life, the thanks of parliament, and, April 13, was created a baronet, with very honourable armorial bearings allusive to the transactions of his life. After this period he never again appeared in active service. In 1810 he married Miss Preston Campbell, of Ferntower and Lochlane, Perthshire, by whom he left no issue. In 1814 he was promoted to the rank of general, and in 1819 became governor of Kinsale in Ireland, and in 1827 of Fort George in the north of Scotland. This brave veteran died at an advanced age, August 18, 1829, at his seat of Ferntower in Perthshire. His lady, who survived him till 1847, erected a monu-

ment to his memory on the top of a romantic hill, named Tom-na-chaisleil (*i.e.* the hill of the castle), in the neighbourhood of Ferntower.

BALCANQUEL, WALTER, D.D., an eminent divine of the seventeenth century, was the son of the Rev. Walter Balcanquel, who was a minister of Edinburgh for forty-three years, and died in August, 1616. Dr. Walter Balcanquel was born at Edinburgh. It has been supposed that he was himself a minister of Edinburgh; but probably the writer who makes this statement only mistakes him for his father, who bore the same name. He entered a bachelor of divinity at Pembroke Hall, Oxford, where, September 8th, 1611, he was admitted a fellow. He appears to have enjoyed the patronage and friendship of King James, and his first preference was to be one of the royal chaplains. In 1617 he became Master of the Savoy in the Strand, London; which office, however, he soon after resigned in favour of Mark Antony de Dominis, Archbishop of Spalatro, who came to England on account of religion, and became a candidate for the king's favour. In 1618 Dr. Balcanquel was sent to the celebrated synod of Dort, as one of the representatives of the Church of Scotland. He has given an account of a considerable part of the proceedings of this grand religious council, in a series of letters to Sir Dudley Carleton, which are to be found in *The Golden Remains of the ever-memorable Mr. John Hales of Eaton*, 4to, 1673. In 1621, the Archbishop of Spalatro having resigned the mastership of the Savoy, Dr. Balcanquel was re-appointed; and on the 12th of March, 1624, being then doctor of divinity, he was installed Dean of Rochester. George Heriot, at his death, February 12th, 1624, ordained Dr. Balcanquel to be one of the three executors of his last will, and to take the principal charge of the establishment of his hospital at Edinburgh. Probably the experience which he had already acquired in the management of the Savoy Hospital might be the chief cause of his being selected for this important duty. Heriot appointed Dr. Balcanquel, by his will, "to repair with all the convenience he can, after my decease, to the town of Edinburgh," in order to conclude with the magistrates about the business of the hospital; allowing him, for his pains, in addition to the sum of one hundred merks, which he enjoyed as an ordinary executor, one hundred pounds sterling, payable by two equal instalments—the first three months after the decease of the testator, and the second at the completion of the hospital.

Dr. Balcanquel is entitled to no small commendation for the able manner in which he discharged this great and onerous trust. The statutes, which, in terms of the testator's will, were drawn up by him, are dated 1627, and do great credit to his sagacity and practical good sense.

Dr. Balcanquel's next appearance in the public concerns of his native country was of a less happy character. In 1638, when Charles I. sent down the Marquis of Hamilton to Scotland, to treat with the Covenanters, the Dean of Rochester accompanied his grace in the capacity of chaplain. What was his external behaviour on this occasion we do not know; but it was afterwards surmised by the Covenanters, that he had been deputed by Archbishop Laud as a spy, at once upon the marquis, who was suspected of moderation, and the people with whom he was dealing. It is asserted by Sir James Balfour, in his *Memorials of State*, that Dr. Balcanquel also communicated intelligence of all that happened in Scotland to Signor George Con, the pope's legate, "as

some of his intercepted letters can beare recorde." Early in the ensuing year was published an apologetical narrative of the court-proceedings, under the title of *His Majesties Large Declaration, concerning the Late Tumults in Scotland*, which by universal and apparently uncontradicted report was ascribed to the pen of Dr. Balcanquel. While this work was received by the friends of the king as a triumphant vindication of his attempts upon the purity of the Scottish church, it only excited new indignation in the minds of the outraged people, who soon after appeared in arms at Dunse Law, to defend their religious freedom with the sword. On the 14th of May, 1639, at the very time when the armies were about to meet on the borders, Dr. Balcanquel, apparently in requital of his exertions, was installed Dean of Durham. He had now rendered himself a marked man to the Scottish Presbyterians, and accordingly his name is frequently alluded to in their publications as an "incendiary." Under this character he was denounced by the Scottish estates, July 29, 1641, along with the Earl of Traquair, Sir John Hay, clerk register, Sir Robert Spottiswoode, and Maxwell, Bishop of Ross, all of whom were regarded as the principal causes of the war between the king and his people. In the *Canterburian's Self-convention*, a pamphlet written in 1641, by the Rev. Robert Baillie, against Archbishop Laud, he is spoken of in a style of such asperity, as might have convinced him that, in the event of a complete triumph of the Presbyterian party, he would share in the proceedings which were now directed against that unhappy prelate. Accordingly, the very next year, when the king could no longer protect his partisans, Dr. Balcanquel was forced from his mastership of the Savoy, plundered, sequestered, and obliged to flee from London. Repairing to Oxford, he attached himself to the precarious fortunes of his sovereign, and for several years afterwards had to shift about from place to place, wherever he could find security for his life. At length, having taken refuge in Chirk Castle, Denbighshire, he died there in a very cold season, on Christmas day, 1645. He was buried next day in the parish church of Chirk, where, some years after, a splendid monument was erected to his memory by a neighbouring royalist, Sir Thomas Middleton of Chirk Castle.

BALFOUR, ALEXANDER. This novelist, poet, and miscellaneous writer was a native of the parish of Monikie, Forfarshire, and was born on the 1st of March, 1767. As he was a twin, and born of parents in humble life, his support in childhood and means of education might have equally been precarious, had he not been supported in boyhood by a friend of the family, who also bestowed upon him such a religious training as not only developed his talents, but fitted him for those adversities which were afterwards to be his lot.

Having received a very limited education at the parish school, where, however, he distinguished himself at the age of twelve years by his attempts in English composition, Alexander Balfour was apprenticed to a weaver; but disliking this occupation, which gave no scope for his growing talents, he returned home, and betook himself to the more congenial attempt of teaching a private school. In this way he also taught himself, and during the intervals of his daily toil gave proofs of his growing proficiency, by writing several articles for the provincial newspapers, and also for Dr. Anderson's miscellany, *The Bee*. After he had wielded the ferula long enough in a rustic seminary to find that he was fit for something better, Balfour in his twenty-sixth

year removed to the thriving town of Arbroath, and became clerk to a sail-cloth manufacturer, on the death of whom he entered into partnership in business with the widow of the deceased; and upon her death, in 1800, he took another partner into the firm. A government contract into which they had entered for supplying the navy with canvas made their business a prosperous one, and Balfour, now in circumstances of comfort, was able to cultivate his literary tastes, and correspond with the learned and talented of the Scottish capital. Having married also in 1794, the year after his arrival in Arbroath, he, in 1814, when he found himself father of a rising family, removed to a country residence at Troctick, near Dundee. Here he also undertook the management of the branch of a London house which for many years had been connected with his own firm, and into which he embarked his whole fortune. But it was an unfortunate mercantile speculation, as in 1815 the mercantile reaction which had occurred on the sudden restoration of peace ruined the London establishment, and Balfour found himself reduced by the unforeseen stroke to utter bankruptcy.

Being thus reduced to his original poverty, with the bitterness of disappointment and failure added to it, the subject of this memoir was fain to accept the situation of manager at a manufacturing establishment in Balgonie, Fifeshire. Resigning this appointment, he afterwards, in 1818, removed to Edinburgh, where he became a clerk in the establishment of Mr. Blackwood, the eminent publisher. Here however a worse calamity than that of mere bankruptcy in fortune awaited him, for in 1819 symptoms of paralysis in his constitution began to appear, which in October became so confirmed that he was obliged to be moved in a wheeled chair. It was well that the vigour of his mind and his literary aptitudes were still untouched, as these were henceforth to form his only occupation as well as means of subsistence.

Being now an author by compulsion as well as choice, Balfour bravely girded himself for the task; and his first production under these circumstances, and upon which he had been some time previously employed, was the novel entitled *Campbell, or the Probationer*, which was published in 1819. It was a subject seldom attempted, as it comprised the literary exertions, the privations, the sorrows, and disappointments of a licentiate of the church scrambling for the bare means of life while in search of a living—the manifold changes of occupation he must undergo, and the unmerited rebuffs he must endure in such a pilgrimage, now happily so rare, but which were so abundant about forty years ago, out of which Balfour contrived to manufacture a marvellous tale of mirth, pathos, and varied incident. It was suited to the day and has now passed into oblivion; but at its appearance it became highly popular, and being published anonymously, the interest of it was heightened, and the public was anxious to know the name and circumstances of the author. After this his pen was not allowed to lie idle, and from his wheeled chair his productions issued with a rapidity that would have been wonderful, had not authorship been not merely his only occupation but his solace. In the same year that his novel of *Campbell* appeared, he edited the poetical works of his deceased friend Richard Gall, to which he also supplied a biographical preface. In 1822 he produced a three-volume novel entitled *The Farmer's Three Daughters*, and this in 1823 was followed by *The Foundling of Glenthorn, or the Smuggler's Cave*, also in three volumes. It was unfortunate, however, that the last two novels proceeded from the Minerva press, a circumstance sufficient to condemn them to

neglect let their merits be what they might. It was not to prose alone that Balfour confined himself, and in 1820 he published *Contemplation, and other Poems*, in one volume 8vo, which added considerably to his literary reputation. To the *Scots Magazine* he had long been a contributor, and on the establishment of Constable's *Edinburgh Magazine* his services were secured for it by Thomas Fringle, its editor. His contributions to this periodical during the nine years of its existence were so numerous, that of themselves they would have filled three octavo volumes; and the articles embraced a variety of themes, but chiefly the manners of Scottish rural life—the theme in which his commencing novel of *Campbell* had excelled, and in which he showed himself completely at home. To Constable's *Magazine* he also contributed many articles in verse, the chief of which were "Characters omitted in Crabbe's Parish Register." In these the delineations were so truthful and striking, and the versification so musical and terse, that they were perused with pleasure and surprise, and thought to be scarcely inferior to those of Crabbe himself. In consequence of this favourable reception, Balfour was induced to publish these sketches in one volume in 1825. In 1827, in consequence of an application from Mr. Joseph Hume, M.P., Mr. Canning conferred on Balfour a treasury donation of £100, in consideration of his genius and misfortunes. Alexander Balfour, in addition to his other literary labours, was until his death a copious contributor to the *Edinburgh Literary Gazette*. The last novel which he published was *Highland Mary*, in four volumes, a work of considerable beauty and pathos, and soon after he died on the 12th of September, 1829. After his death, a volume of his remains was collected and published under the title of *Weeds and Wild-flowers*, by Mr. D. M. Moir, M.D., who also prefixed an excellent memoir of the author.

During the long illness of Alexander Balfour, and the necessity of constant labour for the wants of the day, he bore up not only with resignation and patience, but constant cheerfulness. Although so long a prisoner to his chair, a continual smile was upon his lips; and notwithstanding an impediment in his speech, the effect of his malady, his conversation was always cheerful, and enriched with thought and humour. He was also rigidly temperate in his habits, affectionate in his relationships of father and husband, and religious in his feelings and principles. Upon few indeed have misfortunes and sufferings sat more amiably than upon Alexander Balfour.

BALFOUR, SIR ANDREW, Bart., M.D., who first introduced the dissection of the human body into Scotland, and that at a very superstitious period; who projected the first hospital in the country for the relief of disease and poverty at the public expense; who was the founder of the botanic garden at Edinburgh, and almost the father of the science in Scotland; who planned the Royal College of Physicians at Edinburgh; and bequeathed to the public a museum, which at that time would have been an ornament to any university or any metropolis—was the fifth and youngest son of Sir Michael Balfour of Denmylne in Fife, and was born at that place on the 18th of January, 1630. He prosecuted his studies in the university of St. Andrews, where he took his degree of A.M. At this period his education was superintended by his brother Sir James Balfour, the famous antiquary, and lyon king-at-arms to Charles I., who was about thirty years older than himself. At college he first discovered his attachment to botany, which in him is said to have led to the study of

physic, instead of being, as it generally is, a handmaid to that art. Quitting the university about the year 1650, he removed to London, where his medical studies were chiefly directed by the celebrated Harvey, by Sir Theodore Mayerne the distinguished physician of King James I., and various other eminent practitioners. He afterwards travelled to Blois in France, and remained there for some time, to see the botanic garden of the Duke of Orleans, which was then the best in Europe, and was kept by his countryman Dr. Morison. Here he contracted a warm friendship for that great botanist, which continued unimpaired while they lived. From Blois he went to Paris, where, for a long time, he prosecuted his medical studies with great ardour. He completed his education at the university of Caen, from which he received the degrees of bachelor and doctor of physic, on the 20th of September, 1661.

Returning to London soon afterwards, Dr. Balfour was introduced to Charles II., who named him as the most proper person to attend the young Earl of Rochester on his continental travels. After an absence of four years, he returned with his pupil in 1667. During their tour he endeavoured, and at that time not without some appearance of success, to recall that abandoned young nobleman to the paths of virtue, and to inspire him with the love of learning. Rochester himself often acknowledged, and to Bishop Burnet in particular, only three days before his death, how much he was bound to love and honour Dr. Balfour, to whom, next to his parents, he thought he owed more than to all the world.

On returning to his native country, Balfour settled at St. Andrews as a physician. "He brought with him," says Dr. Walker, in his *Essays on Natural History*, "the best library, especially in medicine and natural history, that had till then appeared in Scotland; and not only these, but a perfect knowledge of the languages in which they were written; likewise many unpublished manuscripts of learned men, a series of antique medals, modern medallions, and pictures and busts, to form the painter and the architect; the remarkable arms, vestments, and ornaments of foreign countries; numerous mathematical, philosophical, and surgical instruments, which he not only possessed, but used; with operations in surgery till then unknown in this country; a complete cabinet with all the simples of the *materia medica*, and new compositions in pharmacy; and large collections of the fossils, plants, and animals, not only of the foreign countries he traversed, but of the most distant parts of the world."

Dr. Balfour's merit was too conspicuous to suffer him to remain long at St. Andrews. In the year 1670 he removed to Edinburgh, where he immediately came into great practice. Here, among other improvements, he prosecuted the manufacture of paper, and was the means of introducing that valuable art into the country—though for many years it remained in a state of complete or nearly complete dormancy; the people deriving stationary articles of all kinds from Holland. Adjoining to his house he had a small botanic garden, which he furnished by the seeds he received from his foreign correspondents; and in this garden he raised many plants which were then first introduced into Scotland. One of his fellow-labourers in this department was Patrick Murray of Livingston, whom he had initiated into the study of natural history. This young gentleman, who enjoyed an ample fortune, formed at his seat in the country a botanic garden, containing 1000 species of plants, which at that period was a very large collection. He traversed the whole of France in quest of the plants of that country; and on his

way to Italy he prematurely died of a fever. Soon after his death Dr. Balfour transferred Murray's collection from Livingston to Edinburgh; and with it, joined to his own, he had the merit of laying the foundation of the public botanic garden. The necessary expense of this new institution was at first defrayed by Dr. Balfour, Sir Robert Sibbald, and the Faculty of Advocates. But at length the city allotted a piece of ground near Trinity College church for a public garden, and out of the revenues of the university allowed a certain sum for its support. As the first keeper of this garden, Dr. Balfour selected Mr. James Sutherland; who, in 1684, published a work entitled *Hortus Edinburgensis*. (See SUTHERLAND.) The new institution soon became considerable: plants and seeds were sent from Morison at Oxford, Watts at London, Marchant at Paris, Herman at Leyden, and Spottiswood at Tangier. From the last were received many African plants, which flourished in this country.

Such efforts as these, by a native Scotsman, occurring at a time when the attention of the country seems to have been almost exclusively devoted to contending systems of church-government, are truly grateful to contemplate. It is only to be lamented, that the spirit which presided over them was premature in its appearance; it found no genial field to act upon, and it was soon forgotten in the prevailing distraction of the public mind. Sir Andrew Balfour was the morning-star of science in Scotland, but he might almost be said to have set before the approach of day.

He was created a baronet by Charles II., which seems to indicate that, like most men of literary and scientific character in that age, he maintained a sentiment of loyalty to the existing dynasty and government, which was fast decaying from the nation. His interest with the ministry, and with the municipality of Edinburgh, seems to have always been considerable, and was uniformly exerted for the public good and for the encouragement of merit.

Upon his settlement in Edinburgh, he had found the medical art taught in a very loose and irregular manner. In order to place it on a more respectable footing, he planned, with Sir Robert Sibbald, the Royal College of Physicians; and of that respectable society his brethren elected him the first president. When the college undertook the publication of a *Pharmacopœia*, the whole arrangement of the *materia medica* was committed to his particular care. For such a task he was eminently qualified by his skill in natural history. This performance made its appearance in 1685; and, in the opinion of Dr. Cullen, it is superior to any *pharmacopœia* of that era.

Not long before his decease, his desire to promote the science of medicine in his native country, joined to the universal humanity of his disposition, led him to project the foundation of an hospital in Edinburgh. The institution was at first narrow and confined, but it survived to be expanded into full shape, as the Royal Infirmary, under the care of George Drummond. Sir Andrew died in 1694, in the sixty-fourth year of his age, after a severe conflict with the gout and other painful disorders; which afforded him an opportunity of displaying, upon the approach of death, those virtues and that equanimity which had distinguished him during his life. His person, like his mind and manners, was elegant. He was possessed of a handsome figure, with a pleasing and expressive countenance; of a graceful elocution; and, by his natural disposition, as well as his long intercourse with the higher ranks in society, of a most courteous and polite demeanour. A print of him was executed at Paris; but no copy is known to exist.

His library and museum were the anxious result of fourteen years of travelling, and between twenty and thirty more of correspondence. For their accommodation he had built an addition to his house when he had nearly arrived at his fortieth year; but after the building was completed, he found himself so infirm as to be unable to place them in that order which he intended. After his death his library, consisting of about 3000 volumes, besides manuscripts, was sold, we suppose by public auction. There is a printed catalogue still extant. His museum was deposited in the hall which was, till 1829, occupied as the university library. There it remained many years, useless and neglected; some parts of it falling to inevitable decay, and other parts being abstracted. "Yet, even after 1750," says Dr. Walker, "it still continued a considerable collection, which I have good reason to remember, as it was the sight of it, about that time, that first inspired me with an attachment to natural history. Soon after that period," to pursue a narrative so deeply disgraceful to the age and the institution referred to, "it was dislodged from the hall where it had been long kept; was thrown aside, and exposed as lumber; was further and further dilapidated, and at length almost completely demolished. In the year 1782, out of its ruins and rubbish I extracted many pieces still valuable and useful, and placed them here in the best order I could. These, I hope, may remain long, and be considered as so many precious relics of one of the best and greatest men this country has produced."

From the account that has been given of Sir Andrew Balfour, every person conversant in natural history or medicine must regret that he never appeared as an author. To his friend Mr. Murray of Livingston he addressed a series of familiar letters, for the direction of his researches while abroad. These letters, forming the only literary relics of Balfour, were subsequently published by his son, in the year 1700.

BALFOUR, SIR JAMES, an eminent lawyer and public character of the sixteenth century, was a son of Balfour of Monquhanny, in Fife, a very ancient family. In youth, being designed for the church, he made considerable proficiency, not only in ordinary literature, but in the study of divinity and law; which were all alike necessary in those times for an ecclesiastic, on account of the mixed character which the age admitted to be assumed by such individuals. Balfour, while still a young man, was so unfortunate as to join with the conspirators who, after assassinating Cardinal Beaton, held out the castle of St. Andrews against the governor Arran. He seems, however, not to have been a very cordial partizan of the conspirators. John Knox, in his own vigorous and plain-spoken manner, styled him the *Blasphemous Balfour*, on account of his having refused to communicate along with his reforming associates. Balfour shared the fate of his companions in being sent to the French galleys,¹ and was confined in the

same vessel along with Knox, from which he escaped in 1550, along with the rest, by the tacit permission of the French government.

Balfour seems to have afterwards joined in the proceedings of the reformers, but only with courtier-like temperance, and without exhibiting much zeal in the Protestant cause. He was preferred to the ecclesiastical appointment of official of Lothian, and afterwards became rector of Flisk, a parish in his native county. In 1563 he was appointed by Queen Mary to be a lord of session, the court then being composed partly of churchmen and partly of laics. In 1564, when the commissary court was instituted in place of the ecclesiastical tribunal, which had been dissolved at the Reformation, Balfour became one of the four commissaries, with a salary of 400 merks, while the others had only 300. In July, 1565, the queen extended the further favour of admitting him into her privy-council.

Balfour was one of those servants of the state who, being advanced rather on account of merit than birth, used at all times to give great offence to the Scottish nobility. It seems to have never been supposed by this haughty class, that there was the least necessity for talented or faithful service in the officials employed by majesty; birth and *following* were the only qualifications allowed by them to be of any value. Accordingly, it is not surprising to find that the same conspiracy which overthrew the "kinless" adventurer Rizzio, contemplated the destruction of Balfour. He was so fortunate, however, as to escape, and even derived some advantage from the event, being promoted to the office of clerk-register, in room of Mr. James Macgill, who was concerned in the conspiracy. He was also about this time made a knight, and appointed to be one of the commissioners for revising, correcting, and publishing the ancient laws and statutes of the kingdom.

In the beginning of the year 1567 Sir James Balfour was appointed governor of Edinburgh Castle. In this important situation he naturally became an object of great solicitude to the confederate lords, who, in the ensuing May, commenced a successful rebellion against Queen Mary. It would appear that Sir James was not now more loyal than many other persons who had experienced the favour of Mary. He is said to have even been the means of throwing into the hands of the confederates that celebrated box of letters upon which they endeavoured to ground the proof of her guilt. There can be no doubt that he was at this time in the way of receiving high favours from the Earl of Murray, who was the chief man opposed to the dethroned queen. He was, in September, 1567, admitted by Murray a lord of his privy-council, and made commendator of the priory of Pittenweem; and in December, a bargain was accomplished, by which he agreed to accept a pension of £500 and the presidency of the court of session, in lieu of the clerk-registry, which Murray wished to be restored to his friend Macgill. Sir James continued faithful to the party which opposed Queen Mary till the death of Murray, January, 1569-70, when he was in some measure compelled to revert to the queen's side, on account of a charge preferred against him by the succeeding regent,

land and see if he knew it. Though at that time very sick, he replied, 'Yes, I know it well, for I see the steeple of that place where God first opened my mouth in public to his glory; and I am fully persuaded, how weak soever I now appear, that I shall not depart this life till that my tongue shall glorify his godly name in the same place.' This striking reply Sir James repeated in the presence of many witnesses, a number of years before Knox returned to Scotland, and when there was very little prospect of his words being verified."—*Life of Knox*, 1st edit. p. 53.

¹ The following anecdote of Balfour in connection with Knox is related by Dr. M'Crie:—"The galleys returned to Scotland in summer 1548, as near as I can collect, and continued for a considerable time on the east coast, to watch for English vessels. Knox's health was now greatly impaired by the severity of his confinement, and he was seized with a fever, during which his life was despaired of by all in the ship. But even in this state his fortitude of mind remained unsubdued, and he comforted his fellow-prisoners with hopes of release. To their anxious desponding inquiries, natural to men in their situation, 'If he thought they would ever obtain their liberty,' his uniform answer was, 'God will deliver us to his glory, even in this life.' While they lay on the coast between Dundee and St. Andrews, Mr. (afterwards Sir) James Balfour, who was confined in the same ship, desired him to look at the

Lennox, who taxed him with a share in the murder of Darnley. For this accusation no proof was ever adduced, but even allowing Sir James to have been guilty, it will only add another to the list of great men concerned in the transaction, and show the more clearly how neither learning, rank, official dignity, nor any other ennobling qualification, prevented a man in those days from staining his hands with blood. Balfour outlived Lennox, and was serviceable in bringing about the pacification between the king's and queen's party, under Morton, in 1573. He would appear to have been encouraged by Morton in the task of revising the laws of the country, which he at length completed in a style allowed at that time to be most masterly. Morton afterwards thought proper to revive the charge brought by Lennox against Sir James, who was consequently obliged to retire to France, where he lived for some years. He returned in 1580, and revenged the persecution of Morton, by producing against him, on his trial, a deed to which he had acceded, in common with others of the Scottish nobility, alleging Bothwell's innocence of the king's murder, and recommending him to the queen as a husband. Sir James died before the 14th of January, 1583-4. As a politician his time-serving character, and facility with which he veered from one party to the other, was pithily characterized by the saying, "He wagged as the bush wagged." Each change of the political wind could be discovered by the changes of Sir James.

The *Practicks of Scots Law*, compiled by Sir James Balfour of Pittendreich, president of the court of session, continued to be used and consulted in manuscript, both by students and practitioners, till nearly a century after his decease, when it was for the first time supplanted by the *Institutes* of Lord Stair. Even after that event it was held as a curious repository of the old practices of Scottish law, besides fulfilling certain uses not answered by the work of Lord Stair. It was therefore printed in 1754 by the Ruddimans, along with an accurate biographical preface by Walter Goodal. The work was of considerable service to Dr. Jamieson in his *Dictionary of the Scottish Language*.

BALFOUR, SIR JAMES, an eminent antiquary, herald, and annalist, was born about the close of the sixteenth century. He was the eldest son of a small Fife laird, Michael Balfour of Denmyne, who derived his descent from James, son of Sir John Balfour of Balgarvy, a cadet¹ of the ancient and honourable house of Balfour of Balfour in Fife. James Balfour, the ancestor of Sir Michael, had obtained the estate of Denmyne from James II., in the fourteenth year of his reign, which corresponds with 1450-1. Michael Balfour, the father of Sir James, and also of Sir Andrew, whose life has been already commemorated, was, in the words of Sir Robert Sibbald, "equally distinguished for military bravery and civil prudence." He bore the honourable office of comptroller of the Scottish household, in the reign of Charles I., and in 1630 was knighted at Holyrood House by George, Viscount Dupplin, chancellor of Scotland, under his majesty's special warrant. This eminent personage was, by Jean Durham, daughter of James Durham of Pitarrow, the father of five sons, all of whom attained to distinction in public life, besides nine daughters, who all formed honourable alliances except two, who died unmarried. He

lived to see three hundred of his own descendants, a number which his youngest son, Sir Andrew, lived to see doubled.

Sir Michael Balfour gave his eldest son an education suitable to the extended capacity which he displayed in his earliest years. This education, of which the fruits are apparent in his taste and writings, was accompanied by a thorough initiation into the duties of religion, as then professed on a Presbyterian model. The genius of the future antiquary was first exhibited in a turn for poetry, which was a favourite study among the scholars of that period, even where there was no particular aptitude to excel in its composition, but for which Sir James Balfour appears to have had a genuine taste.

No specimens indeed of his poetry have survived, but the poetical temperament of Sir James, and the courtly grace which generally is, and ever ought to be, the accompaniment of that character, is shown in the following epistle to a lady, which we consider a very elegant specimen of the English prose of the age of Charles I., and, indeed, singularly so, when the native country of the writer is considered:—

"TO A LADY FOR A FRIEND,

"Madam,—You must appardone me if, after the remembring of my best love to you, I should rander you hartly thanks for your affectione, since thankes are the best knowen blossomes of the hartes strongest desyres. I never, for my pairt, doubtit of your affectione, bot persuadit myselve that so good a creature could never prove unconstant; and altho the fairest dayes may have some stormy overshadowings, yet I persuade myselve that these proceids not from heavenly things, bot from vapors arising from below, and though they for a tyme cont[ra]ct the sun's heat, yet make they that heat in the end to be more powerful. I hope your friends sall have all the contentment that layes in my power to gif them: And, since Malice itselve can not judge of you bot noble, I wisch that tyme make your affectione als constant, as my harte sall ever prove, and remaine loyall; and lest I seime to weirey you more than myselve, again I must beg pardone for all my oversights (if you think of ancy) wich will be a rare perfectione of goodness in you to forgive freely, and love constantly him quhosse greatest happines under heaven is always to leive and die

"Your trewly affectionat servant."

Sir James seems to have spent some of the years subsequent to 1626 in foreign countries, where he is said to have improved himself much by observing the manners of nations more polished than his own, and by forming the acquaintance of eminent literary men. At the close of his continental travels he spent some time in London, and obtained the friendship of the distinguished antiquary Sir Robert Cotton, and also of Sir William Segar, garter king-at-arms. He had now turned his attention to the study of heraldry, and the friendship of these men was of material service in the completion of what might be called his professional education. He also contracted a literary acquaintance with Roger Dodsworth and Sir William Dugdale, to whom he communicated several charters and other pieces of information regarding Scottish ecclesiastical antiquities, which they attached to their *Monasticon Anglicanum*, under the title *Canobia Scotica*.

Besides these antiquarian friends, Balfour secured several others of a more courtly complexion, who were natives of his own country. He enjoyed the friendship of Sir Robert Aytoun, the poetical courtier, with whom he afterwards became distantly connected by marriage. He was also on the most

¹ This branch was ennobled in 1607, in the person of Michael Balfour of Balgarvy, who, having served King James in several embassies to the principal courts of Europe, was created Lord Balfour of Burligh. This peerage was attained in consequence of the concern of its occupant in the civil war of 1715.

familiar terms with another poetical attendant on the elegant court of Charles I.—the Earl of Stirling. His chief patron, however, was George, Viscount Dupplin,¹ who held the high and almost vice-regal office of chancellor of Scotland. By the recommendation of this nobleman, aided by his own excellent qualifications, he was created by Charles I. lord-lyon king-at-arms, a dignified legal office in Scotland, in which resides the management of all matters connected with armorial honours, as also all public ceremonials. Sir Jerome Lyndsay having previously resigned the office, Balfour was crowned and installed at Holyrood House, June 15, 1630, having in the preceding month been invested with the necessary honour of knighthood by the king. On this occasion Lord Dupplin officiated as royal commissioner.

Sir James Balfour now settled in Scotland, in the enjoyment of his office. On the 21st of October he was married to Anna Aiton, daughter of Sir John Aiton of that ilk, and in January, 1631, he obtained, in favour of himself and his spouse, a grant of the lands and barony of Kinnaird in Fife. In December, 1633, he was created a baronet by Charles I., probably in consequence of the able manner in which he marshalled the processions and managed the other ceremonials of the royal visit that year. At this period of peace and prosperity a number of learned and ingenious men were beginning to exert themselves in Scotland. It was a peaceful interval between the desolating civil wars of the minority of King James and the equally unhappy contest which was soon after incited by religious and political dissensions. Like soldiers enjoying themselves during a truce, the people were beginning to seek for and cultivate various sources of amusement in the more elegant arts. This was the era of Jamieson the painter—of Drummond the poet—of the geographer Pont—and the historians Spottiswood, Calderwood, Johnston, and Hume.² Sir James Balfour, inspired with the common spirit of these men, commenced the writing of history with as much zeal as could be expected in an age when the printing of a written work being a comparatively rare occurrence, literature might be said to want the greater part of its temptations.

Sir James, as already mentioned, had been bred a strict Presbyterian. In this profession he continued to the last, notwithstanding that, in politics, he was an equally firm royalist. In a letter to a young nobleman (Correspondence, Advocates' Library) he is found advising a perusal of "Calvine, Beza, Parens, and Whittaker," as "orthodox writers."

¹ Afterwards created Earl of Kinnoull, on the occasion of the coronation of King Charles at Edinburgh in 1633. Sir James Balfour relates the following curious anecdote of his lordship. The king, in 1626, had commanded, by a letter to his royal council, that the Archbishop of St. Andrews should have precedence of the chancellor. To this his lordship would never submit. "I remember," says Sir James, "that K. Charles sent me to the lord-chancellor on the day of his coronation, in the morning, to show him that it was his will and pleasure, but only for that day, that he would cede and give way to the archbishop; but he returned by me to his majesty a very bruske answer, which was, that he was ready in all humility to lay his office doune at his majestie's feet; but since it was his royal will he should enjoy it with the known privileges of the same, never a priest in Scotland should sett a foot before him, so long as his blood was hote. When I had related his answer to the kinge, he said, 'Weel, Lyone, lets goe to business: I will not meddle farther with that olde cankered scottish man, at whose hand there is nothing to be gained but soure words.'" What makes this anecdote the more expressively illustrative of the rancour with which the secular officers and nobility beheld the newly dignified clergy is, that the lord-chancellor had just on the preceding afternoon been raised to the rank of Earl of Kinnoull.

² David Hume of Godscroft, author of the *History of the House of Douglas*.

When the introduction of the liturgy imposed by Charles I. roused Scotland from one end to the other in a fit of righteous indignation, Sir James Balfour, notwithstanding his connection with the government, joined cordially with his countrymen, and wrote an account of the tumult of the 23^d of July, under the burlesque title of *Stoneyfield Day*.

But, though indignant, in common with all people of his own persuasion, at the religious innovations attempted by the government, Sir James appears to have very soon adopted different feelings. Like many moderate persons who had equally condemned the ill-advised conduct of the king, he afterwards began to fear that the opposition would produce greater mischiefs than the evil which was opposed.

It was probably in consequence of this feeling that he retired to the royal hunting-palace of Falkland, where, and at his seat of Kinnaird, he devoted himself to those studies by which the present may be forgotten in the past. His annals, however, show that he still occasionally appeared in public affairs in his capacity of lord-lyon. It is also clear that his political sentiments must have been of no obtrusive character, as he continued in his office during the whole term of the civil war, and was only at last deprived of it by Cromwell. During his rural retirement at Falkland and Kinnaird, he collected many manuscripts relative to heraldry, and wrote many others in his own language, of which some are preserved in the Advocates' Library, while others were either lost at the capture of Perth (1651), to which town he had conveyed them for safety, or have since been dispersed. Persevering with particular diligence in illustrating the *History of Scotland*, he had recourse to the ancient charters and diplomas of the kingdom, the archives of monasteries, and registers of cathedral churches, and in his library was a great number of chronicles of monasteries, both originals and the abridgments; but it is to be deeply regretted that many of these valuable manuscripts fell into the hands of children, or perished in the flames during the civil wars. A few only were opportunely rescued from destruction by those who were acquainted with their value. The style of these monastic chronicles was indeed rude and barbarous; but they were remarkable for the industry, judgment, and fidelity to truth, with which they were compiled. For some time after the erection of monasteries in this kingdom, these writers were almost the only, and certainly the most respectable, observers in literature, as scarcely any other persons preserved in writing the memory of the important occurrences of the times. In these registers and chronicles were to be found an accurate record of transactions with foreign powers, whether in forming alliances, contracting marriages of state, or regulating commerce; letters and bulls of the holy see; answers, edicts, and statutes of kings; church rescripts; provincial constitutions; acts of parliament; battles; deaths of eminent persons; epitaphs and inscriptions; and sometimes the natural appearances of the seasons; the prevalent diseases; miracles and prodigies; the heresies that sprung up, with an account of the authors and their punishments. In short, they committed to writing every important occurrence in church and state, that any question arising in after-ages might be settled by their authority, and the unanimous confirmation of their faithful and accurate chronicles. In collecting and preserving these manuscripts, Balfour therefore raised a monument to his memory which the latest posterity must revere. For he did so from a conviction that these old and approved authors were the only guides to the knowledge of facts, as well as

to correct evidence and reasoning on the remote history of Scotland; and he considered them not only of signal use to himself, but a valuable treasure to the literature of the country. He therefore persevered throughout life in collecting such manuscripts, without regard to either trouble or expense. The catalogue which he left is still extant,¹ although many, as already mentioned, were lost by the depredations of the English and other causes. He formed with great industry, and at a considerable expense, a library of the most valuable books on every subject, particularly in the branches of Scottish history, antiquities, and heraldry. From these he extracted every assistance they could afford in the pursuit of his inquiries, and for further aid he established a correspondence with the most respectable living historians, such as Robert Maule, Henry Maule, David Buchanan, Gordon of Straloch, and Drummond of Hawthornden, all of whom he regarded through life with the warmest esteem and with the greatest respect for their talents and accomplishments.

He endeavoured to elucidate our history (which was then involved in confusion) from the examination of ancient medals, coins, rings, bracelets, and other relics of antiquity, of which he formed a separate collection as an appendage to his library. Observing also from historians that the Romans had long been settled in Scotland, and had made desperate attempts to expel our ancestors, both Scots and Picts, he collected the inscriptions which they had left on certain stone buildings, and transcribed them among his notes. In compiling the work to which he gave the title of *Annals*, our author was more anxious to supply the deficiencies of other historians, and to bring to light obscure records, than to exhibit a continued and regular history of Scotland. He therefore carefully extracted from old manuscripts, the names, dignities, and offices of distinguished public characters, the dates of remarkable transactions, and every other circumstance of importance, and arranged them in separate paragraphs. He was actuated by a generous disposition to rescue from oblivion and the grave the memory of illustrious men; for which purpose he visited all the cathedrals and the principal parish churches of the kingdom, and examined their sepulchres and other monuments, from which he copied the epitaphs and inscriptions, carefully preserving them in a volume. He deeply interested himself in some laudable attempts to improve the geography of Scotland. Sir James made also a survey of Fife, his native county, examining particularly ancient monuments, and the genealogies of the principal families. He afterwards compiled a description of the whole kingdom, of which the manuscript was so useful to Bleau, that he dedicated to our author the map of Lorne in his *Theatrum Scotiæ*, and embellished it with the arms of Balfour.

Zealous in the improvement and knowledge of heraldry, he carefully reviewed, not only the public acts and diplomas of nobility, but the contents of ancient edifices, temples, and palaces, shields and sepulchral monuments. When it had become proper, from his years, to allow the Prince of Wales a separate establishment, an inquiry was ordered concerning the revenues of the hereditary princes, as stewards or lords-marshal of Scotland, in which Balfour appears to have taken part, as we find among his manuscripts the following: "The true present state of the principality of Scotland, with the means how the same may be most conveniently

increased and augmented; with which is joined an survey, and brief notes from the public registers of the kingdoms, of certain infeftments and confirmations given to princes of Scotland; and by them to their vassals of diverse baronies and lands of the principality, since the fifteenth year of the reign of Robert III."

In the history of this country he displayed his uncommon industry in his numerous collection of manuscripts, in the great assemblage of historical works in his own library, and in his careful inspection of the various manuscripts dispersed over the kingdom, from which he generally extracted the substance, if he did not wholly transcribe them, forming a general index to such as were useful in Scottish history. He made several abridgments of the registers of Scone, Cambuskenneth, and others, and from the works of Major, Boece, Leslie, and Buchanan, which, in proper order, formed parts of his chronological works, along with relations of important transactions throughout the world. Besides this he wrote a remarkably concise yet comprehensive *History of the Kings of Scotland, from Fergus I. to Charles I.* He also intended to have enlarged the annals of the Scottish Kings from James I. to the beginning of Charles II., of which he had finished the two first James's on a more diffuse and extensive scale. In other works, he wrote memoirs of James III. IV. V., of Queen Mary, and of James VI., and the transactions of Charles I., brought down to his death. In natural history, he wrote an alphabetical list of gems, with descriptions, their names and qualities, and the places where they are produced. Another work upon the same subject, written in Latin, exhibited, from various authors, an account of ingenious inventions or frauds practised in counterfeiting and imitating precious stones.

Sir James concluded an industrious, and, it would appear, a most blameless life, in February, 1657, when he must have been about sixty years of age. He had been four times married: 1st, to Anna Aiton, by whom he had three sons and six daughters, and who died August 26th, 1644; 2d, to Jean Durham, daughter of the laird of Pitarrow, his own cousin, who died without issue only eleven months subsequent to the date of his first wife's death; 3d, to Margaret Arnot, only daughter of Sir James Arnot of Fernie, by whom he had three sons and three daughters; 4th, to Janet Auchinleck, daughter of Sir William Auchinleck of Balmanno, by whom he had two daughters. Yet his family is now extinct in the male line. The *Annals and Short Passages of State*, above alluded to, were, after nearly two centuries of manuscript obscurity, published in 1824, in 4 volumes 8vo, by Mr. James Haig of the Advocates' Library.

BALFOUR, ROBERT, a distinguished philosopher of the seventeenth century, was principal of Guyenne College, Bordeaux, and is mentioned by Morhof as a celebrated commentator on Aristotle. According to Dempster, he was "the phoenix of his age; a philosopher profoundly skilled in the Greek and Latin languages; a mathematician worthy of being compared with the ancients: and to those qualifications he joined a wonderful suavity of manners, and the utmost warmth of affection towards his countrymen." This eminent personage appears to have been one of that numerous class of Scotsmen, who, having gained all their honours in climes more genial to science than Scotland was a few centuries ago, are to this day better known abroad than among their own countrymen. According to the fantastic Urquhart, who wrote in the reign of Charles I.,

¹ *Memoria Balfouriana*, p. 29-33.

"Most of the Scottish nation, never having astricted themselves so much to the proprieties of words as to the knowledge of things, where there was one preceptor of languages amongst them, there were above forty professors of philosophy: nay, to so high a pitch did the glory of the Scottish nation attain over all the parts of France, and for so long a time continue in that obtained height, by virtue of an ascendant the French conceived the Scots to have above all nations, in matter of their subtlety in philosophical disceptations, that there hath not been, till of late, for these several ages together, any lord, gentleman, or other, in all that country, who being desirous to have his son instructed in the principles of philosophy, would intrust him to the discipline of any other than a Scottish master; of whom they were no less proud than Philip was of Aristode, or Tullius of Cratippus. And if it occurred (as very often it did) that a pretender to a place in any French university, having, in his tender years, been subterfugally to some other kind of schooling, should enter in competition with another aiming at the same charge and dignity, whose learning flowed from a Caledonian source, commonly the first was rejected and the other preferred." It nevertheless appears that Robert Balfour prosecuted the study of philology, as well as that of philosophy, with considerable success. His edition of Cleomedes, published at Bordeaux, in 1605, "*Latine versa, et perpectuo commentario illustrata*," is spoken of in the highest terms of praise by the erudite Barthius. Other works by Balfour are, *Gelasii Cysiceni Commentarius Actorum Niceni Concilii, Roberto Balfouro interprete*, 1604, folio; *Commentarius R. Balforei in Organum Logicum Aristotelis*, 1616, 4to; and *R. Balforei Scoti Commentariorum in lib. Arist. de Philosophia, tomus secundus*, 1620, 4to.

BALFOUR, DR. ROBERT.—This distinguished minister of the Church of Scotland was born in Edinburgh, in April, 1740. He was early trained by his pious parents to the knowledge and practice of Christianity. He received his education at Edinburgh, and when a mere youth he became a member of a society which met for religious conversation and prayer. The devotional tendency of his mind, thus early acquired, was a prominent feature of his character through life. Of his college career no record has been preserved. In 1774 he was ordained to the ministry of the gospel in the small rural charge of Lecropt, near Stirling. Here he laboured with much acceptance for five years, not inattentive meanwhile to his personal improvement, and in his pulpit duties giving no doubtful presages of the professional distinction and influence to which he was destined to rise. In June, 1779, he was translated to the Outer High Church of Glasgow, then vacant by the removal of Mr. Randal (afterwards Dr. Davidson) to Edinburgh.

At the time of Dr. Balfour's settlement in Glasgow evangelical religion was at a low ebb in the Established Church throughout Scotland, and Moderatism was in the ascendant. Dr. Balfour, from the outset of his ministry, warmly espoused the evangelical cause, which he recommended alike by the power of his preaching and by the active benevolence and consistency of his life. His ministry in Glasgow gave a fresh impulse to the revival and diffusion of pure and undefiled religion in the west of Scotland. Christian missions were then in their infancy, and in Scotland met with much opposition from the dominant party in the Established Church. Dr. Balfour was one of the founders of the Glasgow Missionary Society, which was established in 1796, a few months after the institution of the London Missionary

Society. He preached a striking sermon at the commencement of the society, which was one of the few discourses he ventured on publishing; and one of his last public acts, twenty-two years afterwards, was to sign a circular letter as its president. The following passage from the discourse just mentioned bears testimony to the earnest interest he felt in the missionary cause, and affords an example of a style of appeal, which, with the aid of his melodious voice, keen eye, and graceful and fervid elocution, must have proved singularly animating. After describing the true missionary spirit and character, he proceeded—"We invite and press all of this description to come forward full of the Holy Ghost and of faith. We cannot, we will not tempt you with worldly prospects—if you are right-hearted men according to your profession, you will not seek great things for yourselves—you must not think of an easy life—you must labour hard—you must encounter difficulties, opposition, and dangers; for these, however, you are not unprovided. . . . We will follow you with our prayers, and with every blessing in our power to bestow. But what is of infinitely greater moment and advantage to you is, that the Lord Jesus, whose religion you are to teach, will be with you, and that he is greater than all who can be against you. Depending then on him alone for your own salvation, and for the salvation of the heathen; seeking not your own pleasure, profit, or honour, but that he may be glorified in and by you, and by sinners converted from the error of their way, be not afraid—be strong and of good courage. To all who thus devote themselves to his service we most heartily bid God speed. Fly, ye angels of grace, from pole to pole, and from the rivers to the ends of the earth, bearing to all men the glad tidings of the everlasting gospel; stop not in this bold flight of philanthropy, till you convey to the simple sons of the isles the knowledge of the true God and eternal life—till you arrest the wanderings of the roving savage with the wonders of redeeming grace—till you dart the beams of celestial light and love into the dark habitations of ignorance and cruelty—till you convert the barbarous cannibal to humanity, to Christian gentleness and goodness. Hasten to the shores of long-injured Africa, not to seize and sell the bodies of men, but to save their perishing souls. Follow the miserable captives to their several sad destinations of slavery, with the inviting proclamation of spiritual liberty, while you inculcate the strictest duty to their masters. Speed your way to India, to repay her gold with the unsearchable riches of Christ. Meet all the high pretensions of the Brahmim religion and literature, and all their fatal delusions and cruel impositions, with the overpowering evidence of the Christian as a divine revelation—with the full luminous display of evangelical truth and holiness. Cease not, till you see the whole earth filled with the knowledge of the Lord, as the waters cover the channel of the sea."

Dr. Balfour was an eloquent man, but his was not an eloquence which sought its reward in popular applause. It flowed spontaneously from a heart deeply imbued with love to the Saviour and to the souls of men. Earnest preaching made earnest listening, and whilst his reputation in the pulpit continued unimpaired to the close of his life, the fruits of his ministry were abundant, and his influence extended far beyond the limits of his own congregation. His preaching was clear and comprehensive; textual, luminous, and pointed; exhibiting a remarkable intimacy with the varieties of Christian experience, and a profound knowledge of human nature; animated with a warm and persuasive earnest-

ness; faithful and close in applying the truth; and exhibiting an exuberant flow of appropriate and powerful expression. He was not in the habit of writing his discourses at full length, but his preparations for the pulpit were never relaxed. Although not displaying the plodding habits of the scholar, he kept up his knowledge of general literature, and cultivated an acquaintance with the works of the best authors in his own profession. His morning hours were consecrated to study and devotion. He possessed the power of readily commanding his thoughts in the intervals of daily occupation, and was in the habit, to use his own expression, of "carrying about" with him the subjects on which he intended to preach. His stores of thought and illustration were ample and exuberant, and, being gifted with a ready utterance, he could on every occasion express himself with ease and propriety. Without the appearance of much labour, therefore, he was able to appear in the pulpit with a felicity and success to which men of inferior minds find it impossible to attain after the most laborious efforts. He seldom engaged in controversy, and did not often obtrude himself upon the notice of church courts, for the business of which, however, he showed no want of aptitude. His modesty and humility prevented him from issuing more than a few of his more public and elaborate productions through the press. An anecdote is related of him, which illustrates his disinclination to publish, as well as the readiness with which he could draw in an emergency upon the resources of his richly-stored mind. On one occasion, after having preached with much acceptance on the divinity of Christ, he was waited upon by a young man, who, on his own part and that of two companions, preferred an urgent request that he would print his discourse, assigning as a reason that it had completely relieved their minds of doubts which they had been led to entertain on this momentous doctrine, and that it was fitted to have the same effect upon the minds of others similarly situated. On the doctor expressing his aversion to appear in print, his visitor entreated the favour of a perusal of the manuscript. In this he was equally unsuccessful; for it then appeared that the doctor, on proceeding to the church, had found himself—from some unwonted and inexplicable cause—utterly incapable of recalling the train of thought which had occupied his mind in preparing for the pulpit; and at the last moment he was under the necessity of choosing a new text, from which he delivered the unprepared discourse that had produced such a salutary impression upon the minds of his three youthful hearers.

His attachment to his congregation was evinced on the occasion of his receiving an offer to be presented to Lady Glenorchy's chapel in Edinburgh, which he declined, although, in a worldly point of view, it possessed considerable advantages over his charge in Glasgow. He was alike frank, friendly, and accessible to all classes of his people, and had always a kind word for the poor. He showed great tact in dealing with the humbler members of his flock, who sometimes came to the good man with unreasonable complaints. When the old-fashioned practice of the preceptor reading line by line of the psalm was discontinued, an ancient dame presented herself to the minister, to express her concern at the innovation, at the same time gently reproaching him for departing from a good old custom of our pious forefathers—a custom, be it remembered, which had been introduced at a time when few persons in a congregation were able to read. "Oh, Janet," replied the doctor, in a tone of kindly remonstrance,

"I read the psalm, and you sing it; what's the use of coming over it a third time?" "Ou, sir," was the ready answer, "I juist like to gust my gab wi't!" In process of time "repeating tunes" were introduced in the preceptor's desk, and Janet hastened forthwith to the minister, to lodge her complaint against the profane innovation. "What's the matter wi' ye now?" inquired the doctor, as he welcomed the worthy old dame into his presence. "The sang tunes, wi' their o'ercomes brocht into the worship of the sanctuary," quoth she; "it's juist usin' vain repetitions, as the heathens do." "Oh dear no, Janet," slyly interposed the doctor, "we juist like to gust our gabs wi't!"

Dr. Balfour married, in November, 1774, Isabella Stark, daughter of Mr. Stark, collector of excise at Kirkcaldy. She died in October, 1781. In June, 1787, he married Catherine M'Gilchrist, daughter of Mr. Archibald M'Gilchrist, town-clerk of the city of Glasgow. She died in May, 1817. These were not the only instances of domestic bereavement which he experienced in the course of his life. He preached on the day after the celebration of the Lord's supper at Dumbarton, in July, 1786, with an earnestness and solemnity more fervid and impressive than ordinary, as if his mind were under a powerful impulse. On his way home he received information of the death of a beloved and only son, in circumstances fitted deeply to wound his heart. Henry, a fine spirited boy, had been left by his father, then a widower, during an absence of some days, under the charge of Mr. and Mrs. Denniston of West Thorn, and was accidentally drowned in the Clyde. After recovering from the first paroxysm of grief occasioned by the heart-rending intelligence, Dr. Balfour hastened to tender his sympathy to his deeply afflicted friends, whose kindness had been permitted to prove the innocent cause of involving him and his family in this calamity. This he did, in the first instance, in a letter of touching pathos and beauty, which afterwards found its way to the public, and was embodied in a little volume of *Letters addressed to Christians in Affliction*, published in 1817. The death of his son Archibald took place many years previously, on the day when he preached the sermon by appointment of the Glasgow Missionary Society. His own death was sudden. On the 13th of October, 1818, Dr. Balfour appeared to be in his usual health and spirits. In the course of the day he became unwell while walking out with a friend, and made an effort to return home. But his illness increasing, he was assisted into a friend's house in George Street, from which it was deemed imprudent to attempt to remove him. The symptoms were found to be those of apoplexy. He continued in a state of insensibility till the evening of the next day, the 14th, when he expired. He died in the seventy-first year of his age and forty-fifth year of his ministry.

BALIOL, EDWARD. King John Baliol had two sons, Edward and Henry. The former seems entitled to some notice in this work, on account of his vigorous, though eventually unsuccessful, attempt to regain the crown lost by his father. When King John entered into the treaty with the King of France, in 1295, it was stipulated in the first article that his son Edward should marry the daughter of Charles of Valois, niece to the French monarch, receiving with her 25,000 livres de Tournois current money, and assigning to her, as a dowry, £1500 sterling of yearly rent, of which £1000 should be paid out of King John's lands of Baliol, Dampier, Helicourt, and Horné, in France, and £500 out of those of

Lanark, Cadzow, Cunningham,¹ Haddington, and the castle of Dundee, in Scotland. This young prince accompanied his father in his captivity in the Tower, and was subsequently carried with him to France. After the death of John Baliol, Edward quietly succeeded to the French family estates, upon which he lived unnoticed till 1324, when Edward II. commanded that he should be brought over to England, apparently for the purpose of being held up as a rival to Robert Bruce. Whether he now visited England or not is uncertain; but it would rather appear that he did not, as in 1326 he was invited by Edward III. for the same purpose. At this time the English monarch was endeavouring to secure a peace with the King of Scots, but at the same time held himself prepared for war by mustering his barons at Newcastle. He seems to have thought that a threat of taking Baliol under his patronage was apt to quicken the desires of the Scots for an accommodation. Nevertheless, in the summer of this year, the Scots made a bold and successful incursion into England, under Randolph and Douglas, and King Edward was obliged, April, 1328, to consent to the treaty of Northampton, which acknowledged at once the independency of the Scottish crown, and the right of Robert Bruce to wear it. No more is heard of Edward Baliol till after the death of Bruce, when he was tempted by the apparent weakness of Scotland under the minority of David II. to attempt the recovery of his birthright. Two English barons, Henry de Beaumont and Thomas Lord Wake, claimed certain estates in Scotland, which had been declared their property by the treaty of Northampton; Randolph, the Scottish regent, distrusting the sincerity of the English in regard to other articles of this treaty, refused to restore those estates; and the two barons accordingly joined with Baliol in his design. That the English king might not be supposed accessory to so gross a breach of the treaty, he issued a proclamation against their expedition; but they easily contrived to ship 400 men-at-arms and 3000 infantry at Holderness, all of whom were safely landed on the coast of Fife, July 31, 1332. Only eleven days before this event, the Scottish people had been bereft of their brave regent, Randolph, Earl of Moray, who was almost the last of those worthies by whom the kingdom of Bruce had been won and maintained. The regency fell into the hands of Donald, Earl of Mar, in every respect a feeblen man. Baliol, having beat back some forces which opposed his landing, moved forward to Forteviot, near Perth, where the Earl of Mar appeared with an army to dispute his farther progress. As the Scottish forces were much superior in number and position to the English, Baliol found himself in a situation of great jeopardy, and would willingly have retreated to his ships, had that been possible. Finding, however, no other resource than to fight, he led his forces at midnight across the Erne, surprised the Scottish camp in a state of the most disgraceful negligence, and put the whole to the rout. This action, fought on the 12th of August, was called the battle of Dupplin. The conqueror entered Perth, and for some time found no resistance to his assumed authority. On the 24th of September he was solemnly crowned at Scone. The friends of the line of Bruce, though unable to offer a formal opposition, appointed Andrew Moray of Bothwell to be regent in the room of the Earl of

Mar, who had fallen at Dupplin. At Roxburgh, on the 23d of November, Baliol solemnly acknowledged Edward of England for his *liege lord*, and surrendered to him the town and castle of Berwick, "on account of the great honour and emoluments which he had procured through the good-will of the English king, and the powerful and acceptable aid contributed by his people." The two princes also engaged on this occasion to aid each other in all their respective wars. Many of the Scottish chiefs now submitted to Baliol, and it does not appear improbable that he might have altogether retrieved a kingdom which was certainly his by the laws of hereditary succession. But on the 15th of December, the adherents of the opposite dynasty surprised him in his turn at Annan, overpowered his host, and having slain his brother Henry, and many other distinguished men, obliged him to flee, almost naked, and with hardly a single attendant, to England. His subsequent efforts, though not so easily counteracted, were of the same desultory character. He returned into Scotland in March, and lay for some time at Roxburgh with a small force. In May, 1333, he joined his forces with King Edward, and reduced the town of Berwick. The Scottish regent being overthrown at Halidon Hill, July 19, for a time all resistance to the claims of Baliol ceased. In a parliament held at Edinburgh in February, he ratified the former treaty with King Edward, and soon after surrendered to that monarch the whole of the counties on the frontier, together with the province of Lothian, as part of the kingdom of England. His power, however, was solely supported by foreign influence, and, upon the rise of a few of the hostile Scottish barons, in November, 1334, he again fled to England. In July, 1335, Edward III. enabled him to return under the protection of an army. But, notwithstanding the personal presence and exertions of no less a warrior than the victor of Cressy, the Scots never could altogether be brought under the sway of this vassal king. For two or three years Edward Baliol held a nominal sway at Perth, while the greater part of the country was in a state of rebellion against him. The regent Andrew Moray, dying in July, 1338, was succeeded by Robert Stewart, the grandson of Bruce and nephew of David II., who having threatened to besiege Baliol in Perth, obliged him to retreat once more to England. The greater part of the country speedily fell under the dominion of the regent, nor was Edward III. now able to retrieve it, being fully engaged in his French wars. The Scots having made an incursion, in 1344, into England, Baliol, with the forces of the northern counties, was appointed to oppose them. Two years after this period, when the fatal battle of Durham and the capture of David II. had again reduced the strength of Scotland, Baliol raised an insurrection in Galloway, where his family connections gave him great influence, and speedily penetrated to the central parts of the kingdom. He gained, however, no permanent footing. For some years after this period Scotland maintained a noble struggle, under its regent Robert Stewart, against both the pretensions of this adventurer and the power of the King of England, till at length, in 1355-6, wearied out with an unavailing contest, and feeling the approach of old age, Baliol resigned all his claims into the hands of Edward III. for the consideration of 5000 merks, and a yearly pension of £2000. After this surrender, which was transacted at Roxburgh, and included his personal estates, as well as his kingdom, this unfortunate prince retired to England. "The fate of Edward Baliol," says Lord Hailes, "was singular. In his invasion of Scotland during the

¹ "John Baliol is known to have possessed in Cunningham the following lands:—Large, Noddessdale, Southannan, Dalry, Giffen, Cumshuch, Dregburn, the great barony of Kilmarnock, together with Bondintou and Hartshaw; extending in all to about £9900 Scots of valued rent, or about £15,000 real rent at present."—*Robertson's Ayrshire Families*.

minority of David Bruce, he displayed a bold spirit of enterprise, and a courage superior to all difficulties. By the victory at Dupplin he won a crown; some few weeks after, he was surprised at Annan and lost it. The overthrow of the Scots at Halidon, to which he signally contributed, availed not to his re-establishment. Year after year he saw his partisans fall away, and range themselves under the banner of his competitor. He became the pensioner of Edward III. and the tool of his policy, assumed or laid aside at pleasure: and at last, by his surrender at Roxburgh, he did what in him lay to entail the calamities of war upon the Scottish nation, a nation already miserable through the consequences of a regal succession disputed for threescore years. The remainder of his days was spent in obscurity; and the historians of that kingdom where he once reigned know not the time of his death." It may further be mentioned, that neither these historians, nor the Scottish people at large, ever acknowledged Edward Baliol as one of the line of Scottish monarchs. The right of the family of Bruce, though inferior in a hereditary point of view, having been confirmed by parliament on account of the merit of King Robert, this shadowy intruder, though occasionally dominant through the sword, could never be considered the legitimate monarch, more especially as he degraded himself and his country by a professed surrender of its independence, and even of a part of its territory, to a foreign enemy. He died childless, and, it would also appear, unmarried, in 1363, when he must have been advanced to at least the age of seventy.

BALIOL, JOHN, King of Scotland, was the son of John de Baliol, of Bernard's Castle in the county of Durham, a lord of great opulence, being possessed of thirty knights' fees (equal to £12,000 of modern money), and who was a steady adherent of Henry III. in all his civil wars. The mother of Baliol was Devorgilla, one of the three daughters and co-heiresses of Allan, Lord of Galloway, by Margaret, eldest daughter of David, Earl of Huntingdon, brother of Malcolm IV. and William the Lion, kings of Scotland. The first of the English family of Baliol was a Norman noble, proprietor of the manors of Baliol, Harcourt, Dampat, and Horné in France, and who, coming over with the Conqueror, left a son, Guy, whom William Rufus appointed to be lord of the forest of Teesdale and Marwood, giving him at the same time the lands of Middleton and Guiseford in Northumberland. Guy was the father of Bernard, who built the strong castle on the Tees, called from him *Bernard's Castle*. Eustace, son of this noble, was the father of Hugh, who was the father of John de Baliol,¹ the father of the King of Scotland.

¹ John de Baliol has distinguished himself in English literary history, by founding one of the colleges of Oxford, which still bears his name. As this institution is connected in more ways than one with Scotland, the following account of its foundation, from *Chalmers' History of Oxford*, may be read with interest:—"The wealth and political consequence of John de Baliol were dignified by a love of learning, and a benevolence of disposition, which about the year 1263 (or 1268, as Wood thinks), induced him to maintain certain poor scholars of Oxford, in number sixteen, by exhibitions, perhaps with a view to some more permanent establishment, when he should have leisure to mature a plan for that purpose. On his death in 1269, which appears from this circumstance to have been sudden, he could only recommend the objects of his bounty to his lady and his executors, but left no written deed or authority: and as what he had formerly given was from his personal estate, now in other hands, the farther care of his scholars would in all probability have ceased, had not his lady been persuaded to fulfil his intention in the most honourable manner, by taking upon herself the future maintenance of them. . . . The

The circumstances which led to the appearance of John Baliol in Scottish history may be thus briefly narrated. By the death of Alexander III. the crown of Scotland devolved on the Maiden of Norway, Margaret, the only child of Alexander's daughter, late Queen of Norway. As she was only three years of age, and residing in foreign parts, the convention of estates made choice of six noblemen to be regents of the kingdom during her absence or minority; but dissensions soon arising among them, Eric, King of Norway, interposed, and sent plenipotentiaries to treat with Edward, King of England, concerning the affairs of the infant queen and her kingdom. Edward had already formed a scheme for uniting England and Scotland, by the marriage of his eldest son with Margaret, and accordingly, after holding conferences at Salisbury, he sent an embassy to the parliament of Scotland on the 18th of July, 1290, with full powers to treat of this projected alliance. The views of Edward were cheerfully met by the parliament of Scotland: a treaty was drawn out honourable to both parties, in which—to guard against any danger that might arise from so strict an alliance with such a powerful and ambitious neighbour—the freedom and independency of Scotland were fully acknowledged and secured; and commissioners were despatched to Norway to conduct the young queen into her dominions. But this fair hope of lasting peace and union was at once overthrown by the death of the princess on her passage to Britain; and the crown of Scotland became a bone of contention between various competitors, the chief of whom were John Baliol, Lord of Galloway; Robert Bruce, Lord of Annandale; and John Hastings, Lord of Abergavenny. In order to understand the grounds of their several claims, it will be necessary to trace briefly their genealogy.

On the death of the Maiden of Norway, Alexander's grandchild, the crown of Scotland devolved upon the posterity of David, Earl of Huntingdon, younger brother, as already mentioned, of the kings Malcolm and William. David left three daughters, Margaret, Isabella, and Ada. Margaret, the eldest daughter, married Allan, Lord of Galloway, by whom she had an only daughter, Devorgilla, married to John Baliol, by whom she had John Baliol, the subject of this article, who therefore was great-

first step which the Lady Devorgilla took, in providing for the scholars, was to have a house in Horsemonger Lane, afterwards called *Canditch* (from *Canadita Fossa*) in St. Mary Magdalene's parish, and on the site where the present college stands; and being supported in his design by her husband's executors, continued the provision which he allotted. In 1282 she gave them statutes under her seal, and appointed Hugh de Hartipol and William de Menyle as procurators or governors of her scholars. . . . In 1284 the Lady Devorgilla purchased a tenement of a citizen of Oxford, called Mary's Hall, as a perpetual settlement for the principal and scholars of the house of Baliol. This edifice, after receiving suitable repairs and additions, was called New Baliol Hall, and their former residence then began to receive the name of Old Baliol Hall. The same year she made over certain lands in the county of Northumberland, the greater part of which was afterwards lost. The foundation, however, was about this time confirmed by Oliver, Bishop of Lincoln, and by the son of the founder, who was afterwards King of Scotland, and whose consent in this matter seems to entitle him to the veneration of the society. . . . The revenues of the college were at first small, yielding only eightpence *per week* to each scholar, or twenty-seven pounds nine shillings and fourpence for the whole *per annum*, which was soon found insufficient. A number of benefactors, however, promoted the purposes of the founder, by enriching the establishment with gifts of land, money, and church-livings."

Mr. Chalmers also mentions, that in 1340 a new set of statutes for the college received, amongst other confirmatory seals, that of "Edward Baliol, King of Scotland," namely, the grandson of the founder. The seal attached by Devorgilla to the original statutes contains a portrait of her. She died in 1269.

grandson to David, Earl of Huntingdon, by his eldest daughter. Isabella, the second daughter of David, married Robert Bruce, by whom she had Robert Bruce, the competitor—who therefore was grandson to the Earl of Huntingdon by his second daughter. Ada, youngest daughter of David, married John Hastings, by whom she had John Hastings—who therefore was grandson to David by his third daughter. Hastings could have no claim to the crown while the posterity of David's elder daughters were in being; but he insisted that the kingdom should be divided into three parts, and that he should inherit one of them. As, however, the kingdom was declared indivisible, his pretensions were excluded, and the difficulty of the question lay between the two great competitors, Baliol and Bruce,—whether the more remote by one degree, descended from the eldest daughter, or the nearer by one degree, descended from the second daughter, had the better title.

The divided state of the national mind as to the succession presented a favourable opportunity to the ambitious monarch of England for executing a design which he had long cherished against the independence of Scotland, by renewing the unfounded claim of the feudal superiority of England over it. It has been generally supposed that he was chosen arbitrator by the regents and states of Scotland in the competition for the crown; but it appears that his interference was solicited by a few only of the Scottish nobles who were in his own interest. Assuming this, however, as the call of the nation, and collecting an army to support his iniquitous pretensions, he requested the nobility and clergy of Scotland, and the competitors for the crown, to meet him at Norham within the English territories. There, after many professions of good-will and affection to Scotland, he claimed a right of lord paramount over it, and required that this right should be immediately recognized. The Scots were struck with amazement at this unexpected demand; but, feeling themselves entirely in his power, could only request time for the consideration of his claim. Another meeting was fixed upon; and during the interval he employed every method to strengthen his party in Scotland, and by threats and promises to bring as many as possible to acknowledge his superiority. His purpose was greatly forwarded by the mutual distrusts and jealousies that existed among the Scots, and by the time-serving ambition of the competitors, who were now multiplied to the number of thirteen—some probably stirred up to perplex the question, and others perhaps prompted by vanity. On the day appointed (2d June, 1291) in a plain opposite to the castle of Norham, the superiority of the crown of England over the crown of Scotland was fully acknowledged by all the competitors for the latter, as well as by many barons and prelates; and thus Edward gained the object on which his heart had been long set, by conduct disgraceful to himself as it was to those who had the government and guardianship of Scotland in keeping. All the royal castles and places of strength in the country were put into his hands, under the security that he should make full restitution in two months from the date of his award, and with the ostensible reason that he might have a kingdom to bestow on the person to whom it should be adjudged. Having thus obtained his wish, he proceeded to take some steps towards determining the claim of the competitors. Commissioners were appointed to meet at Berwick; and after various deliberations, the crown was finally adjudged to John Baliol, on the 10th of November, 1292, and next day Baliol swore fealty to Edward at Norham.

Baliol was crowned at Scone shortly after; but, that he might not forget his dependency, Edward recalled him into England immediately after his coronation, and made him renew his homage and fealty at Newcastle. He was soon loaded with fresh dignities. In the course of a year he received no fewer than six citations to appear before Edward in the English parliament, to answer private and unimportant complaints which were preferred against him by his subjects. Although led by an insidious policy, and his own ambition, into the most humiliating concessions, Baliol seems not to have been destitute of spirit, or to have received without resentment the indignities laid upon him. In one of the causes before the parliament of England, being asked for his defence—"I am king of Scotland," he said, "I dare not make answer *here* without the advice of my people." "What means this refusal?" said Edward, "you are my liegeman; you have done homage to me; you are here in consequence of my summons!" Baliol replied with firmness, "In matters which respect my kingdom I neither dare nor shall answer in this place, without the advice of my people." Edward requested that he would ask a delay for the consideration of the question; but Baliol, perceiving that his so doing would be construed into an acknowledgment of the jurisdiction of the English parliament, refused.

In the meantime, a war breaking out between France and England, Baliol seized upon it as a favourable opportunity for shaking off a yoke that had become intolerable. He negotiated a treaty with Philip, the French king, on the 23d October, 1295, by which it was agreed to assist one another against their common enemy, the King of England, and not to conclude any separate peace. At the same time Baliol solemnly renounced his allegiance to Edward, and received from the pope an absolution from the oaths of fealty which he had sworn. The grounds of his renunciation were these—That Edward had wantonly, and upon slight suggestions, summoned him to his courts;—that he had seized his English estates, his goods, and the goods of his subjects;—that he had forcibly carried off, and still retained, certain natives of Scotland;—and that, when remonstrances were made, instead of redressing, he had continually aggravated these injuries. Edward is said to have received Baliol's renunciation with more contempt than anger. "The foolish traitor," he exclaimed, "since he will not come to us, we will go to him." He accordingly raised a large army; and, sending his brother into France, resolved himself, in person, to make a total conquest of Scotland.

While Edward advanced towards Berwick, a small army of Scots broke into Northumberland and Cumberland, and plundered the country. The castle of Werk was taken; and 1000 men, whom Edward sent to preserve it, falling into an ambush, were slain. An English squadron, also, which blocked up Berwick by sea, was defeated, and sixteen of their ships sunk. But these partial successes were followed by fatal losses. The King of England was a brave and skilful general; he conducted a powerful army against a weak and dispirited nation, headed by an unpopular prince, and distracted by party animosities. His eventual success was therefore as complete as might have been anticipated. He crossed the Tweed at Coldstream, took Berwick, and put all the garrison and inhabitants to the sword. The castle of Roxburgh was delivered into his hands; and he hastened Wareme, Earl of Surrey, forward, to besiege Dunbar. Wareme was there met by the Scots army, who, abandoning the advantage of their situation, poured down tumultuously on the English,

and were repulsed with terrible slaughter. After this defeat, the castles of Dunbar, Edinburgh, and Stirling fell into Edward's hands, and he was soon in possession of the whole of the south of Scotland.

Baliol, who had retired beyond the river Tay with the shattered remains of his army, despairing of making any effectual resistance, sent messengers to implore the mercy of Edward. The haughty Plantagenet communicated the hard terms upon which alone he might hope for what he asked; namely, an unqualified acknowledgment of his "unjust and wicked rebellion," and an unconditional surrender of himself and his kingdom into the hands of his master. Baliol, whose life presents a strange variety of magnanimous efforts and humiliating self-abasements, consented to these conditions; and the ceremony of his degradation accordingly took place, July 2, 1296, in the churchyard of Stracathro, a village near Montrose. Led by force and in fear of his life into the presence of the Bishop of Durham and the English nobles, mounted on a sorry horse, he was first commanded to dismount; and his treason being proclaimed, they proceeded to strip him of his royal ornaments. The crown was snatched from his head, the ermine torn from his mantle, the sceptre wrested from his hand, and everything removed from him belonging to the state and dignity of a king. Dressed only in his shirt and drawers, and holding a white rod in his hand, after the fashion of penitents, he confessed that, by evil and false counsel, and through his own simplicity, he had grievously offended his liege lord, recapitulated all the late transactions, and acknowledged himself to be deservedly deprived of his kingdom. He then absolved his people from their allegiance, and signed a deed resigning his sovereignty over them into the hands of King Edward, giving his eldest son as a hostage for his fidelity.

The acknowledgment of an English paramountcy has at all times been so disagreeable to the Scottish people, and the circumstances of this renunciation of the kingdom are so extremely humiliating to national pride, that John Baliol has been ever since held in hatred and contempt, and is scarcely allowed a place in the ordinary rolls of the Scottish monarchs. It must be said, however, in his defence, that his first acknowledgment of the paramountcy was no more than what his rival Bruce and the greater part of the nobles of the kingdom were also guilty of; while he is certainly entitled to some credit for his efforts to shake off the yoke, however inadequate his means were for doing so, or whatever ill fortune he experienced in the attempt. In his deposition, notwithstanding some equivocal circumstances in his subsequent history, he must be looked upon as only the victim of an overwhelming force.

The history of John Baliol after his deposition is not in general treated with much minuteness by the Scottish historians, all of whom seem to have wished to close their eyes as much as possible to the whole affair of the resignation, and endeavoured to forget that the principal personage concerned in it had ever been King of Scotland. This history, however, is curious. The disrowned monarch and his son were immediately transmitted, along with the stone of Scone, the records of the kingdom, and all other memorials of the national independence, to London, where the two unfortunate princes were committed to a kind of honourable captivity in the Tower. Though the country was reduced by the English army, several insurrections which broke out in the subsequent year showed that the hearts of the people were as yet unsubdued. These insurgents invariably rose in the name of the deposed king John, and avowed a resolution to submit to no other authority.

It is also worth remarking, as a circumstance favourable to the claims and character of Baliol, that he was still acknowledged by the pope, the King of France, and other continental princes. When Wallace rose to unite all the discontented spirits of the kingdom in one grand effort against the English yoke, he avowed himself as only the governor of the kingdom in name of King John; and there is a charter still extant, to which the hero appended the seal of Baliol, which seems, by some chance, to have fallen into his hands. The illustrious knight of Elderslie, throughout the whole of his career, acknowledged no other sovereign than Baliol; and, what is perhaps more remarkable, the father of Robert Bruce, who had formerly asserted a superior title to the crown, and whose son afterwards displaced the Baliol dynasty, appeared in arms against Edward in favour of King John, and in his name concluded several truces with the English officers. There is extant a deed executed on the 13th of November, 1299, by William, Bishop of St. Andrews, Robert Bruce, Earl of Carrick, and John Comyn the younger, styling themselves guardians of the kingdom of Scotland; in which they petition King Edward for a cessation of hostilities, in order, as they afterwards expressed themselves, that they might live as peaceable subjects under their sovereign King John.

There is, however, no reason to suppose that these proceedings were in accordance with any secret instructions from Baliol, who, if not glad to get quit of his uneasy sovereignty at the time he resigned it, at least seems to have afterwards entertained no wish for its recovery. A considerable time before his insurgent representatives made the above declaration in his behalf, he is found executing a deed of the following tenor: "In the name of God, amen. In the year 1298, on the 1st of April, in the house of the reverend father, Anthony, Bishop of Durham, without London. The said bishop discoursing of the state and condition of the kingdom of Scotland, and of the inhabitants of the said kingdom, before the noble Lord John Baliol; the said John, of his own proper motion, in the presence of us, the notary, and the subscribing witnesses, amongst other things, said and delivered in the French tongue to this effect, that is to say, that while he, the said realm of Scotland, as king and lord thereof, held and governed, he had found in the people of the said kingdom so much malice, fraud, treason, and deceit, that, for their malignity, wickedness, treachery, and other detestable facts, and for that, as he had thoroughly understood, they had, while their prince, contrived to poison him, it was his intention never to go or enter into the said kingdom of Scotland for the future, or with the said king or its concerns, either by himself or others, to intermeddle, nor, for the reasons aforesaid, and many others, to have anything to do with the Scots. At the same time, the said John desired the said Bishop of Durham, that he would acquaint the most magnificent prince, and his lord, Edward, the most illustrious King of England, with his intention, will, and firm resolution in this respect. This act was signed and sealed by the public notary, in the presence of the Bishop of Durham aforesaid, and of Ralph de Sandwich, constable of the Tower of London, and others who heard this discourse."¹

We regret for the honour of Scotland, that, excepting the *date* of this shameful libel, there is no other reason for supposing it to be dictated in an insincere spirit. Baliol now appears to have really entertained no higher wish than to regain his personal liberty, and be permitted to spend the rest of his

¹ *Prynne's Collections*, iii. 665.

days in retirement. Accordingly, having at last convinced King Edward of his sincerity, he and his son were delivered, on the 20th of July, 1299, to the pope's legate, the Bishop of Vicenza, by whom they were transported to France. The unfortunate Baliol lived there upon his ample estates till the year 1314, when he died at his seat of Castle Galliard, aged about fifty-five years. Though thus by no means advanced in life, he is said to have been afflicted with many of the infirmities of old age, among which was an entire deprivation of sight.

BALLENTYNE (or **BELLENDEN**), JOHN, — otherwise spelled *Ballanden* and *Ballentyn* — an eminent poet of the reign of James V., and the translator of Boecce's Latin *History*, and of the first five books of Livy, into the vernacular language of his time, was a native of Lothian, and appears to have been born towards the close of the 15th century. He studied at the university of St. Andrews, where his name is thus entered in the records: "1508, *Jo. Ballenty nat. Lan [donic].*" It is probable that he remained there for several years, which was necessary before he could be laureated. His education was afterwards completed at the university of Paris, where he took the degree of Doctor of Divinity; and, as has been remarked by his biographer [*Works of Bellenden*, i. xxxvii.], "the effects of his residence upon the Continent may be traced both in his idiom and language."

He returned to Scotland during the minority of James V., and became attached to the establishment of that monarch as "clerk of his comptis."

The biographer of Ballentyne, above quoted, supposes that he must have been the "Maister Johnne Ballentyne" who, in 1528, was "secretar and servitour" to Archibald, Earl of Angus, and in that capacity appeared before parliament to state his master's reasons for not answering the summons of treason which had been issued against him. We can scarcely, however, reconcile the circumstance of his being then a "Douglas's man," with the favour he is found to have enjoyed a few years after with James V., whose antipathy to that family was so great as probably to extend to all its connections. However this may be, Ballentyne is thus celebrated, in 1530, as a court poet, by Sir David Lyndsay, who had been in youth his fellow-student at St. Andrews, and was afterwards his fellow-servant in the household of the king:—

"But now of late has start up heastly
A cunning clerk that writeth craftily;
A plant of poets, called *Ballanten*,
Whose ornat writs my wit cannot defyne;
Get he into the court authority,
He will precel Quintin and Kenedy."

In 1530 and 1531 Ballentyne was employed, by command of the king, in translating Boecce's *History*, which had been published at Paris in 1526. The object of this translation was to introduce the king and others who had "missed their Latin" to a knowledge of the history of their country. In the epistle to the king at the conclusion of this work, Ballentyne passes a deserved compliment upon his majesty, for having "dantit this region and brocht the same to sicken rest, gud peace and tranquillity; howbeit the same could nocht be done be your gret baronis during your tender age;" and also says, without much flattery, "Your nobill and worthy deidis proceeds mair be naturall inclination and active curage, than ony gudly persuasoun of assisteris." He also attests his own sincerity by a lecture to the king on the difference between tyrannical and just government; which, as a curious specimen of the

prose composition of that time, and also a testimony to the enlightened and upright character of Ballentyne, we shall extract into these pages:—

"As Seneca says, in his tragedie, all ar nocht kingis that bene clothit with purple and dredoure, but only they that sekis na singulare profiet, in damage of the commonweill; and sa vigilant that the life of their subditis is mair deir and precious to them than thair awin life. Ane tyrane sekis riches; ane king sekis honour, conquest be virtew. Ane tyrane governis his realmis be slauchter, dredoure, and falsit; ane king gidis his realme be prudence, integrite, and favour. Ane tyrane suspekis all them that hes riches, gret dominioun, auctorite, or gret rentis; ane king haldis sic men for his maist helply friendis. Ane tyrane luffis nane bot vane fleshouris, vicious and wicket lymmaris, be quahis counsall he rages in slauchter and tyranny; ane king luffis men of wisdom, gravite, and science; knowing weil that his gret materis maybeweill dresst be thair prudence. Treuth is that kingis and tyrannis hes mony handis, mony ene, and mony mo memberis. Ane tyrane sets him to be dred; ane king to be luffet. Ane tyrane rejoices to mak his pepill pure; ane king to mak thame riche. Ane tyrane draws his pepill to sindry factiones, discord, and hatred; ane king maks peace, tranquillite, and concord; knowing nothing sa dammagious as division among his subditis. Ane tyrane confounds all divine and humane lawis; ane king observis thaim, and rejoices in equite and justice. All thir properteis sal be patent, in reding the livis of gud and evil kingis, in the history precedent."

To have spoken in this way to an absolute prince shows Ballentyne to have been not altogether a courtier.

He afterwards adds, in a finely impassioned strain:—"Quhat thing maybe mair plesand than to se in this present volume, as in ane cleir mirroure, all the variance of tyme bygane; the sindry chancis of fourtoun; the biudy fechtung and terrible berganis sa mony years continuit, in the defence of your realm and liberte; quihilk is fallen to your hiennes with gret felicite, howbeit the samin has aftimes been ransomit with maist nobill blude of your antecessoris. Quhat is he that wil nocht rejoice to heir the knychtly afaris of thay forcy campions, King Robert Bruce and William Wallace? The first, be innative desyre to recover his realme, wes brocht to sic calamite, that mony dayis he durst nocht appeir in sicht of pepill; but among desertis, levand on rutes and herbis, in esperance of better fortoun; bot at last, be his singulare manheid, he come to sic preminent glore, that now he is reput the maist valyeant prince that was eftir or before his empire. This other, of small beginning, be feris curage and corporal strength, not only put Englishmen out of Scotland, but als, be feir of his awful visage, put Edward king of England to flight; and held all the borders forncie Scotland waist."

Ballentyne delivered a manuscript copy of his work to the king, in the summer of 1533, and about the same time he appears to have been engaged in a translation of Livy. The following entries in the treasurer's book give a curious view of the prices of literary labour in the court of a king of those days:—

"To Maister John Ballentyne, be the kingis precept, for his translating of the Chronykil, £30.

"1531, Oct. 4th. To Maister John Ballentyne, be the kingis precept, for his translating of the Chronickis, £30.

"Item, Thairafter to the said Maister Johnne, be the kingis command, £6.

"1533, July 26. To Maister John Ballentyne, for ane new Chronikle gevin to the kingis grace, £12.

"Item, To him in part payment of the translation of Titus Livius, £8.

"— Aug. 24. To Maister John Ballentyne, in part payment of the second buke of Titus Livius, £8.

"— Nov. 30. To Maister John Ballentyne, be the kingis precept, for his laboris done in translating of Livie, £20."

The literary labours of Ballentyne were still further rewarded by his royal master, with an appointment to the archdeanery of Moray, and the escheated property and rents of two individuals, who became subject to the pains of treason for having used influence with the pope to obtain the same benefice, against the king's privilege. He subsequently got a vacant prebendaryship in the cathedral of Ross. His translation of Boece was printed in 1536, by Thomas Davidson, and had become in later times almost unique, till a new edition was published in a remarkably elegant style, in 1821, by Messrs. Tait, Edinburgh. At the same time appeared the translation of the first two books of Livy, which had never before been printed. The latter work seems to have been carried no further by the translator.

Ballentyne seems to have lived happily in the sunshine of court favour during the remainder of the reign of James V. The opposition which he afterwards presented to the Reformation brought him into such odium, that he retired from his country in disgust, and died at Rome, about the year 1550.

The translations of Ballentyne are characterized by a striking felicity of language, and also by a freedom that shows his profound acquaintance with the learned language upon which he wrought. His *Chronicle*, which closes with the reign of James I., is rather a paraphrase than a literal translation of Boece, and possesses in several respects the character of an original work. Many of the historical errors of the latter are corrected—not a few of his redundancies retrenched—and his more glaring omissions supplied. Several passages in the work are highly elegant, and some descriptions of particular incidents reach to something nearly akin to the sublime. Many of the works of Ballentyne are lost—among others a tract on the Pythagoric letter, and a discourse upon virtue and pleasure. He also wrote many political pieces, the most of which are lost. Those which have reached us are principally poems prefixed to his prose works—a species of composition not apt to bring out the better qualities of a poet; yet they exhibit the workings of a rich and luxuriant fancy, and abound in lively sallies of the imagination. They are generally allegorical, and distinguished rather by incidental beauties than by the skilful structure of the fable. The story, indeed, is often dull, the allusions obscure, and the general scope of the piece unintelligible. These faults, however, are pretty general characteristics of allegorical poets, and they are atoned for, in him, by the striking thoughts and the charming descriptions in which he abounds, and which, "like threds of gold, the rich arras, beautify his works quite thorow."

BALMER, REV. ROBERT, D.D.—This profound theologian and valued ornament of the Secession Church, was born at Ormiston Mains, in the parish of Eckford, Roxburghshire, on the 22d of November, 1787. His father, who was a land-steward, was a man in comfortable though not affluent circumstances, and Robert's earliest education—besides the ordinary advantages which the peasantry of Scotland possessed—enjoyed the inestimable benefit of a care-

ful religious superintendence, both of his parents being distinguished for piety and intelligence. The result of such training was quickly conspicuous in the boy, who, as soon as he could read, was an earnest and constant reader of the Bible, while his questions and remarks showed that he studied its meaning beyond most persons of his age. His thirst for general knowledge was also evinced by a practice sometimes manifested by promising intellectual boyhood—this was the arresting of every stray leaf that fell in his way, and making himself master of its contents, instead of throwing it carelessly to the winds. On the death of his father, Robert, who, although only ten years old, was the eldest of the family, on the evening of the day of the funeral, quietly placed the books for family worship before his widowed mother, as he had wont to do before his departed parent when he was alive. She burst into tears at this touching remembrance of her bereavement, but was comforted by the considerate boy, who reminded her that God, who had taken away his father, would still be a Father to them, and would hear them—"and, mother," he added, "we must not go to bed to-night without worshipping him." Consolation so administered could not be otherwise than effectual: the psalm was sung, the chapter read, and the prayer offered up by the sorrowing widow in the midst of her orphans; and the practice was continued daily for years, until Robert was old enough to assume his proper place as his father's representative.

The studious temperament of Robert Balmer, which was manifested at an early period, appears to have been not a little influenced by his delicate health, that not only prevented him from joining in the more active sports of his young compcers, but promoted that thoughtfulness and sensibility by which sickly boyhood is frequently characterized. The same circumstance also pointed out to him his proper vocation; and he said, on discovering his inability even for the light work of the garden, "Mother, if I do not gain my bread by my head, I'll never do it with my hands." As to which of the learned professions he should select, the choice may be said to have been already made in consequence of his domestic training: he would be a minister of the gospel, and that too in the Secession Church to which his parents belonged. He proceeded to the study of Latin, first at the parish school of Morebattle, and afterwards that of Kelso, at the latter of which seminaries he formed a close acquaintanceship with his schoolfellow, Thomas Pringle, afterwards known as the author of *African Sketches*, which was continued till death. In 1802 Mr. Balmer entered the university of Edinburgh, and, after passing through the usual course of classical, ethical, and scientific study, was enrolled as a student in theology in connection with the Associate Synod. Even already he had established for himself such a respectable intellectual reputation, that his young brethren in preparation for the ministry received him with more than ordinary welcome. As Dr. Lawson, the theological professor of the Associate Synod, lectured only for two months of each year, at the end of summer and commencement of autumn, Mr. Balmer, in common with several of his fellow-students, attended the regular course of theology during the winters at the university of Edinburgh. They thus availed themselves of the twofold means of improvement which they possessed, without any compromise of their principles being exacted in return; and the fruits of this were manifest in after-life, not only by the highly superior attainments of many of the Secession ministry, but the liberal spirit and kindly feeling which they

learned to cherish toward their brethren of the Established Church, and the affectionate intercourse that often continued between them to the end. This, however, alarmed some of the elder and more rigid brethren of the Synod: they thought that this liberality savoured of lukewarmness, and would in time prove a grievous snare; and, under the impression, an overture was introduced into the Synod, for the prevention of all such erratic courses in future. The students of Selkirk who studied under Dr. Lawson took the alarm at this threatened restriction, and the petition and remonstrance presented by them in vindication was drawn up by Mr. Balmer. Although some indignation was expressed at the students for the liberty they had thus taken in addressing the supreme court of their church, the petition was received by the Synod, and the obnoxious overture dismissed. One of the senior and leading members observed on this occasion that he would be sorry to see any measure adopted which would tend to drive from their body the man who could write such a paper.

After having finished the four years' course of divinity prescribed by the Presbyterian churches of Scotland, it was expected that Mr. Balmer should apply for license as a preacher. This was the more necessary in the communion to which he belonged, as the number of his licentiates scarcely equalled that of the vacant congregations. But, to the surprise of his friends, he held back for two years, and his delay was attributed to unworthy motives. Already one of the most promising students of the connection, it was thought that he demurred from mere pride of intellect, and was unwilling to identify himself with a cause which as yet had produced so few men of high mark: others, who were aware that he had already been advised to pass over to the Established Church, and share in its honours and emoluments, imagined that he had taken the advice to heart, and only waited the fit season for such a step. But these surmises were as unkind as they were untrue. His ambition went no higher than to be the humble useful minister of some country Burgher congregation, while his humility confirmed him in the belief that he would have for his brethren men of still higher attainments than his own. His delay entirely originated in scruples of conscience. He had thought anxiously and profoundly upon the subject, and could not wholly admit the formula which he would be required to subscribe as a licentiate. "On the question," he afterwards said, "demanding an assent to the Confession and Catechisms, I stated, that to me these documents appeared so extensive and multifarious as to be disproportioned to the narrow limits of the human mind; that I at least had not studied every expression in them so carefully as to be prepared to assent to it with the solemnity of an oath; that I approved of them, however, in so far as I had studied them; and that the Presbytery might ascertain, by strict examination, the amount of my attainments, and treat me accordingly—which of course they did." His scruples were respected, his explanations in assenting to the formula admitted; and on the 4th of August, 1812, he was licensed as a preacher of the gospel by the Associate Presbytery of Edinburgh.

On commencing the great work to which all his studies had been directed, Mr. Balmer began under rather inauspicious circumstances. All are aware how essential certain external advantages are in the formation of an acceptable and popular preacher, and how completely a dissenting preacher depends upon this popularity for his call to the ministry, and the successful discharge of his duties. But in the graces of person and manner Mr. Balmer was decidedly

wanting. His eyes, from their weakness, had an unpleasant cast, and his figure was ungainly; his voice was monotonous; and his gestures were, to say the least, inelegant. For a person in his position to surmount such obstacles argued a mind of no ordinary power. And he did surmount them. Such was the depth and originality of thought, the power of language, and heart-moving unction which his sermons possessed, that his growing acceptability bade fair in a short time to convert these defects into positive excellencies in the eyes of his captivated auditories. In a few months he received calls from not less than four congregations, so that he would have been in a strait to choose, had not the laws of his church provided for such doubtful emergencies. Amid such competition, the choice devolved upon the Synod, modified, however, by the personal wishes of the preacher thus called; and on Balmer expressing a preference for the congregation at Berwick, he was ordained his minister on the 23d of March, 1814.

The life of a Secession minister in a third-rate town affords few points for a limited memoir. They are also of such a regular monotonous character, that the history of a single month is a sufficient specimen of whole years so occupied. And yet, while thus employed, Mr. Balmer was neither a dull nor inefficient workman. He threw the whole of his large intellect and warm heart into his sacred duties; and while he secured the love of his congregation, his reputation was silently growing and going onward, until, without seeking it, he found himself a man of high mark and influence in that important segment of the church universal to which he belonged. And all the while he was continuing to improve his faculties, and extend his intellectual resources, for his was not a mind to rest satisfied with past acquisitions, however sufficient they might be for the present demand. Events also occurred, or were searched out and found sufficient to keep up that wholesome stir of mind without which the best of duties are apt to become a monotonous task. Among these was the exercise of his pen in a review of the work of Hall of Leicester on *Terms of Communion*, which was inserted in two numbers of the *Christian Repository* of 1817. He was also on several occasions a visitor to London, whither he was called on clerical duty; and in these southward journeys he enjoyed much "colloquy sublime" with Robert Hall, of whom his reminiscences are among the most interesting that have appeared of that great pulpit orator and theological metaphysician. He also took a keen interest in the union of the two parties of the Secession Church, known by the name of Burghers and Anti-burghers, which took place in 1820. This was an event that was dear to his heart, for not only was he a lover of Christian concord, and the enemy of all infinitesimal distinctions that keep brethren asunder, but he had been born in that union; for although his father and mother had belonged to the different parties, they had always lived and acted as those who are completely at one. In 1826 he married Miss Jane Scott, daughter of Mr. Alexander Scott of Aberdeen, and sister of John Scott, the well-known author of *Visits to Paris*. In the year following he was involved—as what minister in Scotland was not more or less involved?—in what is still vividly remembered under the name of the "Apocrypha controversy." Mr. Balmer endeavoured on this occasion to reconcile the contending parties, and was requited by the suspicions of the one, and the active hostility of the other, for his pains. Such was the fate of not a few at this time who endeavoured to perform the part of peacemakers. They are "blessed" indeed—but not of men, and

must look elsewhere than to the earth for their reward. After the Apocryphical, the Voluntary controversy predominated, in which the Secession, utterly renouncing the Establishment principle, which it had hitherto recognized in theory, became thoroughly and completely a dissent, by proclaiming the inexpediency and unlawfulness of civil establishments of religion, and contending for a separation between church and state. On this occasion, Mr. Balmer took the part that might have been expected from his character and situation. He was allied in friendship with many ministers of the Established Church; and, in common with many of his brethren, he was conscious of the fickleness of popular rule. All this was well so long as the question was left to every man's conscience. But when it swelled into a public controversy, and when every person was obliged to take a side, and be either the friend or the enemy of voluntarism, Mr. Balmer acted as every Secession minister did, who still meant to abide at his post. He thought that the voluntary system, although an evil, was the least evil of the two, and therefore he became its apologist and advocate.

On the death of Dr. Dick of Glasgow, who for thirteen years had been professor of theology in the Associate, and afterwards in the United Associate Synod, it was resolved to establish three divinity professorships, instead of one. On this occasion Mr. Balmer's high talents were recognized, by his appointment, in 1834, first to the chair of pastoral theology, and afterwards to that of systematic theology. Although Glasgow was the sphere of his professorship, his duties called him away from Berwick only two months in the year. The duties of such a brief session, however, were scarcely less than those of a six months' course in our well-endowed universities. The following is an account of them given by one of his pupils:—"It is not, I presume, necessary to say more of the nature of his course than that it consisted of five parts—one preliminary, on the Christian evidences; one supplementary, on Christian morals; the other three consisting respectively of—topics in revelation preparatory to the scheme of redemption; of the work of the Redeemer; and of the blessings of redemption. Those subjects were gone over in a series of lectures, extending over the last three years of the students' course. Each session occupied eight weeks, and the number of weekly lectures, each of an hour's length, was five, so that the total number delivered in a full course was, after every abatement for interruption and irregularity, somewhere below 120. Another hour daily was somewhat irregularly divided between examinations, or rather oral lectures, and hearing of the discourses of between forty and fifty students, in the third and fifth years of their progress, to which was sometimes added an occasional voluntary essay." Of the manner in which these duties were discharged, the same pupil affectionately adds:—"Who can ever forget the hours spent in hearing these prelections, or the singularly impressive manner of him by whom they were delivered? The simplicity of the recluse student, exalted into the heavenliness of mature sainthood—the dignified composure, mixed with kindly interest—the look of unworldly purity and abstract intelligence, that more than redeemed the peculiar and unpromising features—the venerable hoary head, that no one could refuse to rise up and honour—all strongly fixed the eye; and then came the full stream of a never-to-be-forgotten voice, monotonous only in simple and unimportant sentences, but varied in striking cadence through all the members of an exquisitely balanced period, and now kindling into animation and emphasis in the glow of

argument, now sinking into thrilling solemnity and tenderness with the falls of devout emotion; while all the while no play of look, or fervour of tone, or strange sympathetic gesture, could disturb your idea of the reigning self-possession and lofty moral dignity of the speaker. Never had lecturer a more attentive audience. The eagerness of note-taking alone broke the general silence."

When these important labours were finished, Mr. Balmer returned at the end of each session to Berwick, not for the purpose of rest, however, but to resume his clerical duties with double vigour. In this way his life went on from year to year—silent indeed, and overlooked by the world in general; but who can trace or fully estimate the effects of such a life upon the generations to come? He who in such fashion rears up teachers of religion may live and die unnoticed, but never unfelt: his deeds will travel onward from generation to generation, even when his name has utterly passed away; he will still live and instruct, in his pupils, and the disciples of his pupils, though his dust may long ago have mouldered in the winds. In 1840 Mr. Balmer received from the university of St. Andrews the degree of Doctor in Divinity, which was conferred upon him by the senatus without influence or solicitation. During the latter years of his life, a controversy was agitated in the United Secession upon the extent of the atonement, which threatened at one time to rend that church asunder. In such a case, it could not be otherwise than that Dr. Balmer, however unwillingly, should express his sentiments upon the question at issue. This he did, but with such gentleness and moderation, as to soften the keenness of debate, and increase the general esteem in which he was held by all parties. After this his season arrived in which every theological doubt and difficulty ends in unswerving and eternal certainty. A short but severe illness, the result of mental anxiety acting upon a feeble frame—the first and last attack of serious pain and sickness he had ever felt—ended his life on the 1st of July, 1844. This event, however anticipated from his years and growing infirmities, not only threw his whole congregation into the deepest sorrow, each individual feeling himself bereaved of an honoured and affectionate father, but struck with a sudden thrill the extensive Associate Secession church through its whole range in Scotland and England. Even the funeral of Dr. Balmer was significant of his catholic liberality and high talents—of one who had lived in Christian peace and love with all, and won the admiration and esteem of all; for in the town business was suspended, the inhabitants assembled as if some prince of the land was to be honoured and bewailed in his death, and the coffin was followed to the grave by the ministers of every denomination, both of the English and Scottish Establishment and dissent, who dwelt in the town and country. A monumental obelisk was soon after erected over the grave by his affectionate congregation. Two volumes of his writings have also been published since his death, the one consisting of pulpit discourses, and the other of academical lectures, in which the high estimate taken of his talents by the church to which he belonged is fully justified.

BALNAVES, HENRY, of Halhill, an eminent lay reformer, and also a theological writer of some eminence, was born of poor parents in the town of Kirkcaldy. After an academical course at St. Andrews, he travelled to the Continent, and, hearing of a free school in Cologne, procured admission to it, and received a liberal education, together with in-

struction in Protestant principles. Returning to his native country, he applied himself to the study of law, and acted for some time as a procurator at St. Andrews. In the year 1538 he was appointed by James V. a senator of the College of Justice, a court only instituted five years before. Notwithstanding the jealousy of the clergy, who hated him on account of his religious sentiments, he was employed on important embassies by James V., and subsequently by the governor Arran, during the first part of whose regency he acted as secretary of state. Having at length made an open profession of the Protestant religion, he was, at the instigation of Arran's brother, the Abbot of Paisley, dismissed from that situation. He now appears to have entered into the interests of the English party against the governor, and accordingly, with the Earl of Rothes and Lord Gray, was thrown into Blackness Castle (November, 1543), where he probably remained till relieved next year on the appearance of the English fleet in the Firth of Forth. There is much reason to believe that this sincere and pious man was privy to the conspiracy formed against the life of Cardinal Beaton; an action certainly not the brightest in the page of Scottish history, but of which it is not too much to say, that it might have been less defensible if its motive had not been an irregular kind of patriotism. Balnaves, though he did not appear among the actual perpetrators of the assassination, soon after joined them in the castle of St. Andrews, which they held out against the governor. He was consequently declared a traitor, and excommunicated. His principal employment in the service of the conspirators seems to have been that of an ambassador to the English court. In February, 1546-7, he obtained from Henry VIII. a subsidy of £1180, besides a quantity of provisions for his compatriots, and a pension of £125 to himself, which was to run from the 25th of March. On the 15th of this latter month he had become bound, along with his friends, to deliver up Queen Mary, and also the castle of St. Andrews, into the hands of the English; and in May he obtained a further sum of £300. While residing in the castle, he was instrumental, along with Mr. John Rough and Sir David Lindsay of the Mount, in prevailing upon John Knox to preach publicly in St. Andrews—the first regular ministrations in the reformed religion in Scotland.

When the defenders of the castle surrendered in August, Balnaves shared in their fate, along with Knox and many other eminent persons. He was conveyed to the castle of Rouen, in France, and there committed to close confinement. Yet he still found occasional opportunities to communicate with his friend Knox. Having employed himself during his solitary hours in composing a treatise on Justification, he conveyed it to the reformer, who was so much pleased with it, that he divided it into chapters, added some marginal notes and a concise epitome of its contents, and prefixed a commendatory dedication, intending that it should be published in Scotland as soon as opportunity offered. This work fell aside for some years, but, after Knox's death, was discovered in the house of Ormiston by Richard Bannatyne, and was published at Edinburgh, in 1584, under the title of *The Confession of Faith, containing, how the Troubled Man should seek Refuge at his God, thereto led by Faith, &c.: Compiled by M. Henrie Balnaves of Halhill, one of the Lords of Session and Counsell of Scotland, being a Prisoner within the Old Palace of Roane, in the Year of our Lord 1548. Direct to his faithful Brethren being in like Trouble or more, and to all True Professors and Favourers of the Sincere Word of God.* Dr. M'Crie has given some

extracts from this work in his life of John Knox. After his return from banishment, Balnaves took a bold and conspicuous part in the contest carried on by the lords of the congregation against the regent Mary. He was one of the commissioners who, in February, 1559-60, settled the treaty at Berwick between the former insurgent body and the Queen of England, in consequence of which the Scottish reformation was finally established through aid from a country always heretofore the bitterest enemy of Scotland. In 1563 he was reappointed to the bench, and also nominated as one of the commissioners for revising the *Book of Discipline*. He acted some years later, along with Buchanan and others, as counsellors to the Earl of Murray, in the celebrated inquiry by English and Scottish commissioners into the alleged guilt of Queen Mary. He died, according to Mackenzie, in 1579.

"In his *Treatise upon Justification*," says the latter authority, "he affirms that the justification spoken of by St. James is different from that spoken of by St. Paul; for the justification by good works, which St. James speaks of, only justifies us before man; but the justification by faith, which St. Paul speaks of, justifies us before God: and that all, yea, even the best of our good works, are but sins before God."

"And," adds Mackenzie, with true Jacobite sarcasm, "whatever may be in this doctrine of our author's, I think we may grant to him that the most of all his actions which he valued himself upon, and reckoned good works, were really great and heinous sins before God, for no good man will justify rebellion and murder."

Without entering into the controversies involved by this proposition, either as to the death of Cardinal Beaton or the accusations against Queen Mary, we may content ourselves with quoting the opinion entertained of Balnaves by the good and moderate Melville: he was, according to this writer, "a godly, learned, wise, and long experimented counsellor." "A poem" by Balnaves, entitled *An Advice to Headstrong Youth*, is selected from Bannatyne's manuscript into *The Evergreen*.

BANNATYNE, GEORGE, takes his title to a place in this work from a source of fame participated by no other individual within the range of Scottish biography: it is to this person that we are indebted for the preservation of nearly all the productions of the Scottish poets of the fifteenth and sixteenth centuries. Though the services he has thus rendered to his country were in some measure the result of accident; yet it is also evident that, if he had not been a person of eminent literary taste, and also partly a poet himself, we should never have had to celebrate him as a collector of poetry. The compound claim which he has thus established to our notice, and the curious antique picture which is presented to our eye by even the little that is known regarding his character and pursuits, will, it is hoped, amply justify his admission into this gallery of eminent Scotsmen.

George Bannatyne was born in an elevated rank of society. His father, James Bannatyne, of the Kirktown of Newtyle, in the county of Forfar, was a writer in Edinburgh, at a time when that profession must have been one of some distinction and rarity; and he was probably the person alluded to by Robert Semple in *The Defens of Grissell Sandylands*:—

"For men of law I wait not quhair to luke;
James Bannatyne was anis a man of skill."

It also appears that James Bannatyne held the office of TABULAR to the Lords of Session, in which office

his eldest son (afterwards a Lord of Council and Session) was conjoined with him as successor, by royal precept, dated May 2, 1583. James Bannatyne is further ascertained to have been connected with the very ancient and respectable family of Bannachtyne, or Bannatyne, of Camys (now Kames), in the island of Bute. He was the father, by his wife Katharine Taillieffer, of twenty-three children, nine of whom, who survived at the time of his death, in 1583, were "weill and sufficiently provydit be him, under God."

George Bannatyne, the seventh child of his parents, was born on the 22d day of February, 1545, and was bred up to trade.¹ It is, however, quite uncertain at what time he began to be engaged in business on his own account, or whether he spent his youth in business or not. Judging, however, as the world is apt to judge, we should suppose, from his taste for poetry, and his having been a writer of verses himself, that he was at least no zealous applicant to any commercial pursuit. Two poems of his, written before the age of twenty-three, are full of ardent though conceited affection towards some fair mistress, whom he describes in the most extravagantly complimentary terms. It is also to be supposed that, at this age, even though obliged to seek some amusement during a time of necessary seclusion, he could not have found the means to collect, or the taste to execute, such a mass of poetry as that which bears his name, if he had not previously been almost entirely abandoned to this particular pursuit. At the same time there is some reason to suppose that he was not altogether an idle young man, given up to vain fancies, from the two first lines of his valedictory address at the end of his collection:

"Heir endis this buik writin in tyme of pest,
Quhen we fra labor was compell'd to rest."

Of the transaction on which the whole fame of George Bannatyne rests we give the following interesting account from the memoir just quoted:—

"It is seldom that the toils of the amanuensis are in themselves interesting, or that, even while enjoying the advantages of the poor scribe's labour, we are disposed to allow him the merit of more than mere mechanical drudgery. But in the compilation of George Bannatyne's manuscript there are particulars which rivet our attention on the writer, and raise him from a humble copyist into a national benefactor.

"Bannatyne's manuscript is in a folio form, containing upwards of 800 pages, very neatly and closely written, and designed, as has been supposed, to be sent to the press. The labour of compiling so rich a collection was undertaken by the author during the time of pestilence, in the year 1568, when the dread of infection compelled men to forsake their usual employments, which could not be conducted without admitting the ordinary promiscuous intercourse between man and his kindred men.

"In this dreadful period, when hundreds, finding themselves surrounded by danger and death, renounced all care save that of selfish precaution for their own safety, and all thoughts save apprehensions

of infection, George Bannatyne had the courageous energy to form and execute the plan of saving the literature of a whole nation; and, undisturbed by the universal mourning for the dead, and general fears of the living, to devote himself to the task of collecting and recording the triumphs of human genius;—thus, amid the wreck of all that was mortal, employing himself in preserving the lays by which immortality is at once given to others, and obtained for the writer himself. His task, he informs us, had its difficulties; for he complains that he had, even in his time, to contend with the disadvantage of copies old, maimed, and mutilated, and which long before our day must, but for this faithful transcriber, have perished entirely. The very labour of procuring the originals of the works which he transcribed must have been attended with much trouble and some risk, at a time when all the usual intercourse of life was suspended; and when we can conceive that even so simple a circumstance as the borrowing and lending a book of ballads was accompanied with some doubt and apprehension, and that probably the suspected volume was subjected to fumigation and the precautions used in quarantine.²

"In the reign of James IV. and V. the fine arts, as they awakened in other countries, made some progress in Scotland also. Architecture and music were encouraged by both of those accomplished sovereigns; and poetry, above all, seems to have been highly valued at the Scottish court. The King of Scotland, who, in point of power, seems to have been little more than the first baron of his kingdom, held a free and merry court, in which poetry and satire seem to have had unlimited range, even where their shafts glanced on royalty itself. The consequence of this general encouragement was the production of much poetry of various kinds, and concerning various persons, which the narrow exertions of the Scottish press could not convey to the public, or which, if printed at all, existed only in limited editions, which soon sunk to the rarity of manuscripts. There was therefore an ample mine out of which Bannatyne made his compilation, with the intention, doubtless, of putting the lays of the 'makers' out of the reach of oblivion by subjecting the collection to the press. But the bloody wars of Queen Mary's time³ made that no period for literary adventure; and the tendency of the subsequent age to polemical discussion discouraged lighter and gayer studies. There is, therefore, little doubt, that had Bannatyne lived later than he did, or had he been a man of less taste in selecting his materials, a great proportion of the poetry contained in his volume must have been lost to posterity; and, if the stock of northern literature had been diminished only by the loss of such of Dunbar's pieces as Bannatyne's manuscript contains, the damage to posterity would have been infinite."

The pestilence which caused Bannatyne to go into retirement commenced at Edinburgh upon the 8th of September, 1568, being introduced by a merchant

² With deference to Sir Walter, we would suggest that the suspicion under which books are always held at a time of pestilence as a means of conveying the infection, gives great reason to suppose that George Bannatyne had previously collected his original manuscripts, and only took this opportunity of transcribing them. The writing of 800 folio pages in the careful and intricate style of calligraphy then practised, appears a sufficient task in itself for three months, without supposing that any part of the time was spent in collecting manuscripts. And hence we see the greater reason for supposing that a large part of the attention of George Bannatyne before his twenty-third year was devoted to Scottish poetry.

³ The accomplished writer should rather have said, the minority of James VI., whose reign had commenced before the manuscript was written.

¹ In a *Memoir of George Bannatyne*, by Sir Walter Scott, prefixed to a collection of *memorialia* regarding him, which has been printed for the Bannatyne Club, it is supposed that he was not early engaged in business. But this supposition seems only to rest on an uncertain inference from a passage in George Bannatyne's *Memoriall Buik*, where it is mentioned that Katharine Taillieffer, at her death in 1570, left behind her eleven children, of whom eight were as yet "unput to profit." On a careful inspection of the family notices in this *Memoriall Buik*, it appears as likely that George himself was one of those already "put to profit" as otherwise, more especially considering that he was then twenty-five years of age.

of the name of Dalgleish. We have, however, no evidence to prove that Bannatyne resided at this time in the capital. We know, from his own information, that he wrote his manuscript during the subsequent months of October, November, and December; which might almost seem to imply that he had lived in some other town, to which the pestilence only extended at the end of the month in which it appeared in Edinburgh. Leaving this in uncertainty, it is not perhaps too much to suppose that he might have adopted this means of spending his time of seclusion from the fictitious example held out by Boecaccio, who represents the tales of his *Decameron* as having been told for mutual amusement by a company of persons who had retired to the country to escape the plague. A person so eminently acquainted with the poetry of his own country might well be familiar with the kindred work of that illustrious Italian.

The few remaining facts of George Bannatyne's life, which have been gathered up by the industry of Sir Walter Scott, may be briefly related. In 1572 he was provided with a tenement in the town of Leith, by a gift from his father. This would seem to imply that he was henceforward, at least, engaged in business, and resided either in Edinburgh or at its neighbouring port. It was not, however, till the 27th of October, 1587, that, being then in his forty-third year, he was admitted in due and competent form to the privileges of a merchant and guild-brother of the city of Edinburgh. "We have no means of knowing what branch of traffic George Bannatyne chiefly exercised; it is probable that, as usual in a Scottish burgh, his commerce was general and miscellaneous. We have reason to know that it was successful, as we find him in a few years possessed of a considerable capital, the time being considered, which he employed to advantage in various money-lending transactions. It must not be forgot that the penal laws of the Catholic period pronounced all direct taking of interest upon money to be usurious and illegal. These denunciations did not decrease the desire of the wealthy to derive some profit from their capital, or diminish the necessity of the embarrassed land-holder who wished to borrow money. The mutual interest of the parties suggested various evasions of the law, of which the most common was, that the capitalist advanced to his debtor the sum wanted, as the price of a corresponding annuity, payable out of the lands and tenements of the debtor, which annuity was rendered redeemable upon the said debtor repaying the sum advanced. The moneyed man of those days, therefore, imitated the conduct imputed to the Jewish patriarch by Shylock. They did not take

—interest—not as you would say
Directly interest,

but they retained payment of an annuity as long as the debtor retained the use of their capital, which came to much the same thing. A species of transaction was contrived, as affording a convenient mode of securing the lender's money. Our researches have discovered that George Bannatyne had sufficient funds to enter into various transactions of this kind in the capacity of lender; and, as we have no reason to suppose that he profited unfairly by the necessities of the other party, he cannot be blamed for having recourse to the ordinary expedients to avoid the penalty of an absurd law, and accomplish a fair transaction, dictated by mutual expediency."

Bannatyne, about the same time that he became a burgher of Edinburgh, appears to have married his spouse, Isobel Mawchan [apparently identical with the modern name *Maughan*], who was the relict of

Baillie William Nisbett, and must have been about forty years of age at the time of her second nuptials, supposing 1586 to be the date of that event, which is only probable from the succeeding year having produced her first child by Bannatyne. This child was a daughter, by name Janet or Jonet; she was born on the 3d of May, 1587. A son, James, born on the 6th of September, 1589, and who died young, completes the sum of Bannatyne's family. The father of Bannatyne died in the year 1583, and was succeeded in his estate of Newtyle by his eldest living son, Thomas, who became one of the Lords of Session by that designation—an appointment which forms an additional voucher for the general respectability of the family. George Bannatyne was, on the 27th of August, 1603, deprived of his affectionate helpmate, Isobel Mawchan, at the age of fifty-seven. She had lived, according to her husband's *Memoriall*, "a godly, honourable, and virtuous life; was a wise, honest, and true matron, and departed in the Lord in a peaceful and godly manner."

George Bannatyne himself deceased previous to the year 1608, leaving only one child, Janet, who had, in 1603, been married to George Foulis of Woodhall and Ravelstone, second son of James Foulis of Colingtown. His valuable collection of Scottish poetry was preserved in his daughter's family till 1712, when his great-grandson, William Foulis of Woodhall, bestowed it upon the Honourable William Carmichael of Skirling, advocate, brother to the Earl of Hyndford, a gentleman who appears to have had an eminent taste for such monuments of antiquity. While in the possession of Mr. Carmichael it was borrowed by Allan Ramsay, who selected from its pages the materials of his popular collection styled *The Evergreen*. Lord Hailes, in 1770, published a second and more correct selection from the Bannatyne manuscript; and the venerable tome was, in 1772, by the liberality of John, third Earl of Hyndford, deposited in the Advocates' Library at Edinburgh, where it still remains.

We have already alluded to George Bannatyne as a poet; but, to tell the truth, his verses display little, in thought or imagery, that could be expected to interest the present generation; neither was he perhaps a versifier of great repute, even in his own time.

It only remains to be mentioned that the name of George Bannatyne has been appropriately adopted by a company of Scottish literary antiquaries, interested, like him, in the preservation of such curious memorials of the taste of past ages, as well as such monuments of history as might otherwise run the hazard of total perdition.

BARBOUR, JOHN, a name of which Scotland has just occasion to be proud, was Archdeacon of Aberdeen in the later part of the fourteenth century. There has been much idle controversy as to the date of his birth; while all that is known with historic certainty may be related in a single sentence. As he was an archdeacon in 1357, and as, by the canon law, no man without a dispensation can attain that rank under the age of twenty-five, he was probably born before the year 1332.

As to his parentage or birthplace we have only similar conjectures. Besides the probability of his having been a native of the district in which he afterwards obtained high clerical rank, it can be shown that there were individuals of his name in and about the town of Aberdeen, any one of whom might have been his father. The name, which appears to have been one of that numerous class derived from trades, is also found in persons of the same era who were connected with the southern parts of Scotland.

In attempting the biography of an individual who lived four or five centuries ago, and whose life was commemorated by no contemporary, all that can be expected is a few unconnected, and perhaps not very interesting, facts. It is already established that Barbour, in 1357, was archdeacon of the cathedral of Aberdeen, and fulfilled a high trust imposed upon him by his bishop. It is equally ascertained that, in the same year, he travelled, with three scholars in his company, to Oxford, for purposes connected with study. A safe-conduct granted to him by Edward III., August 23d, at the request of David II., conveys this information in the following terms: "*Venendo, cum tribus scholaribus in comitiva sua, in regnum nostrum Anglie, causa studendi in universitate Oxonie et ibidem actus scholasticos exercendo, morando, exinde in Scotiam ad propria redeundo.*" It might have been supposed that Barbour only officiated in this expedition as tutor to the three scholars; but that he was himself bent on study at the university is proved by a second safe-conduct, granted by the same monarch, November 6th, 1364, in the following terms: "To Master John Barbour, Archdeacon of Aberdeen, with four knights (*equites*), coming from Scotland, by land or sea, into England, to study at Oxford, or elsewhere, as *he* may think proper." As also from a third, bearing date November 30th, 1368: "To Master John Barbour, with two valets and two horses, to come into England and travel through the same, to the other dominions of the king, versus Franciam, *causa studendi*, and of returning again." It would thus appear that Barbour, even after that he had attained a high ecclesiastical dignity, found it agreeable or necessary to spend several winters at Oxford in study. When we recollect that at this time there was no university in Scotland, and that a man of such literary habits as Barbour could not fail to find himself at a loss even for the use of a library in his native country, we are not to wonder at his occasional pilgrimages to the illustrious shrine of learning on the banks of the Isis. On the 16th of October, 1635, he received another safe-conduct from Edward III., permitting him "to come into England and travel throughout that kingdom, *cum sex sociis suis equitibus, usque Sanctum Dionisium*," i.e. with six knights in company, to St. Dennis in France. Such slight notices suggest curious and interesting views of the manners of that early time. We are to understand from them that Barbour always travelled in a very dignified manner, being sometimes attended by four knights and sometimes by no fewer than six, or at least by two mounted servants. A man accustomed to such state might be the better able to compose a chivalrous epic like *The Bruce*.

There is no other authentic document regarding Barbour till the year 1373, when his name appears in the list of auditors of exchequer for that year, being then described as "*clericus probationis domus domini nostri regis*;" i.e. apparently—auditor of the comptroller's accounts for the royal household. This, however, is too obscure and solitary an authority to enable us to conclude that he bore an office under the king. Hume of Godscroft, speaking of "the Bruce's book," says: "As I am informed, the book was penned by a man of good knowledge and learning, named Master John Barbour, Archdeacon of Aberdeene, for which work he had a yearly pension out of the exchequer during his life, which he gave to the hospital of that towne, and to which it is allowed and paid still in our dayes."¹ This fact, that a pension was given him for writing his book, is authenticated by an unquestionable document. In

the *Rotuli Ballivorum Burgi de Aberdonia* for 1471, the entry of the discharge for this royal donation bears that it was expressly given "for the compilation of the *Book of the Deeds of King Robert the First*," referring to a prior statement of this circumstance in the more ancient rolls:—"Et decano et capitulo Abirdonensis percipienti annuatim viginti solidos pro anniversario quondam Magistri Johannis Barberi, pro compilatione libri gestorum Regis Roberti primi, ut patet in antiquis Rotulis de anno Compoti, xx. s." The first notice we have of Barbour receiving a pension is dated February 18th, 1390; and although this period was only about two months before the death of Robert the Second, it appears from the rolls that to that monarch the poet was indebted for the favour. In the roll for April 26th, 1398, this language occurs:—"Quam recolendie memorie quondam dominus Robertus secundus, rex Scottorum, dedit, concessit, et carta sua confirmavit quondam Johanni Barbere archidiacono Aberdonensi," &c. In the roll dated June 2d, 1424, the words are these:—"Decano et capitulo ecclesie cathedralis Aberdonensis percipientibus annuatim viginti solidos de firmis dicti burgi pro anniversario quondam Magistri Johannis Barbar pro compilatione libri de gestis Regis Roberti Brwise, ex concessione Regis Roberti Secundi, in plenam solutionem dicte pensionis," &c. Barbour's pension consisted of £10 Scots from the customs of Aberdeen, and of 20 shillings from the rents or burrow-mails of the same city. The first sum was limited to "the life of Barbour;" the other to "his assignees whomsoever, although he should have assigned it in the way of mortification." Hume of Godscroft and others are in a mistake in supposing that he appropriated this sum to an hospital, for it appears from the accounts of the great chamberlain that he left it to the chapter of the cathedral church of Aberdeen, for the express purpose of having mass said for his soul annually after his decease. Barbour's anniversary, it is supposed, continued till the Reformation; and then the sum allowed for it reverted to the crown.

All that is further known of Barbour is, that he died towards the close of 1395. This appears from the chartulary of Aberdeen, and it is the last year in which the payment of his pension of £10 stands on the record.

The Bruce, which Barbour himself informs us he wrote in the year 1375, is a metrical history of Robert I.—his exertions and achievements for the recovery of the independence of Scotland, and the principal transactions of his reign. As Barbour flourished in the age immediately following that of his hero, he must have enjoyed the advantage of hearing from eye-witnesses narratives of the war of liberty. As a history, his work is of good authority; he himself boasts of its *soothfastness*; and the simple and straightforward way in which the story is told goes to indicate its general veracity. Although, however, the object of the author was mainly to give a *soothfast* history of the life and transactions of Robert the Bruce, the work is far from being destitute of poetical feeling or rhythmical sweetness and harmony. The lofty sentiments and vivid descriptions with which it abounds, prove the author to have been fitted by feeling and by principle, as well as by situation, for the task which he undertook. His genius has lent truth all the charms that are usually supposed to belong to fiction. The horrors of war are softened by strokes of tenderness that make us equally in love with the hero and the poet. In battle-painting Barbour is eminent: the battle of Bannockburn is described with a minuteness, spirit, and fervency, worthy of the day.

¹ *History of the Douglasses*,

The apostrophe to freedom, after the painful description of the slavery to which Scotland was reduced by Edward, is in a style of poetical feeling very uncommon in that and many subsequent ages, and has been quoted with high praise by the most distinguished Scottish historians and critics:—

"A! freedom is a nobill thing!
Freedom mayse man to haiff liking!
Freedom all solace to man gifvis;
He levys at ease that frely levys!
A noble hart may haiff nane ese,
Na ellys nocht that may him please,
Gyff freedom failthe: for fre liking
Is yearnyt our all othir thing
Na he, that ay hase leyllt fre,
May nocht know wevnt the propyrt,
The angry, na the wrechyt dome,
That is cowplyt to foule thyrdidome.
Bot gyff he had assayit it,
Than all perquer he suld it wryt:
And suld think freedom mar to pryse
Than all the gold in world that is."¹—(Book i. l. 225.)

"Barbour," says an eminent critic in Scottish poetical literature, "was evidently skilled in such branches of knowledge as were then cultivated, and his learning was so well regulated as to conduce to the real improvement of his mind; the liberality of his views and the humanity of his sentiments appear occasionally to have been unconfined by the narrow boundaries of his own age. He has drawn various illustrations from ancient history, and from the stories of romance, but has rarely displayed his erudition by decking his verses with the names of ancient authors: the distichs of Cato,² and the spurious productions of Dares Phrygius and Dictys Cretensis, are the only profane books to which he formally refers. He has borrowed more than one illustration from Statius, who was the favourite classic of those times, and who likewise appears to have been the favourite of Barbour: the more chaste and elegant style of Virgil and Horace were not so well adapted to the prevalent taste as the strained thoughts and gorgeous diction of Statius and Claudian. The manner in which he has incidentally discussed the subject of astrology and necromancy may be specified as not a little creditable to his good sense. It is well known that these branches of divination were assiduously cultivated during the ages of intellectual darkness. The absurdity of astrology and necromancy he has not openly attempted to expose; for as the opinions of the many, however unfounded in reason, must not be too rashly stigmatized, this might have been too bold and decided a step. Of the possibility of predicting events he speaks with the caution of a philosopher; but the following passage

¹ Some readers may perhaps arrive at the sense of this fine passage more readily through the medium of the following paraphrase:—

"Ah, Freedom is a noble thing,
And can to life a relish bring;
Freedom all solace to man gives;
He lives at ease that freely lives,
A noble heart may have no ease,
Nor aught beside that may it please,
If freedom fail—for 'tis the choice,
More than the chosen, man enjoys.
Ah, he that ne'er yet lived in thrall,
Knows not the weary pains which gall
The limbs, the soul, of him who 'plains
In slavery's foul and festering chains;
If these he knew, I ween right soon
He would seek back the precious boon
Of freedom, which he then would prize
More than all wealth beneath the skies."

² 'And Catone sayis us in his wryt
To fenyhe foly quible is wyt.'—(*The Bruce*, 4to, p. 13.)

may be considered as a sufficient indication of his deliberate sentiments:—

'And sen that ar in sic wenyng,
For owtyne certant off witting,
Me think quha sayis he knawis thingis
To cum, he makys great gabingis.'

To form such an estimate required a mind capable of resisting a strong torrent of prejudice; nor is it superfluous to remark, that in an age of much higher refinement, Dryden suffered himself to be deluded by the prognostications of judicial astrology. It was not, however, to be expected that Barbour should on every occasion evince a decided superiority to the general spirit of the age to which he belonged. His terrible imprecation on the person who betrayed Sir Christopher Seton, 'In hell condampnyt mot he be!' ought not to have been uttered by a Christian priest. His detestation of the treacherous and cruel King Edward induced him to lend a credulous ear to the report of his consulting an infernal spirit. The misfortunes which attended Bruce at almost every step of his early progress he attributes to his sacrilegious act of slaying Comyn at the high altar. He supposes that the women and children who assisted in supplying the brave defenders of Berwick with arrows and stones were protected from injury by a miraculous interposition. Such instances of superstition or uncharitable zeal are not to be viewed as marking the individual; gross superstition, with its usual concomitants, was the general spirit of the time; and the deviations from the ordinary track are to be traced in examples of liberal feeling or enlightened judgment."³

One further quotation from the Scottish contemporary and rival of Chaucer may perhaps be admitted by the reader; it gives one of the slight and minute stories with which the poet fills up his narrative:—

"The king has hard a woman cry;
He askyt quhat that was in hy.
'It is the layndar, Schyr,' said aye,
'That her child-dill rycht now has tane,
'And mun leve now behind us her;
'Tharfor scho makys yone iwill cher.'
The king said, 'Certis it war pite
'That scho in that poynt left suld be:
'For certis I trow that is na man
'That he ne will rew a woman than.'
Hiss ost all thar arestyt he,
And gert a tent sone stentit be,
And gert hyr gang in hastily,
And othyr wemen to be hyr by,
Qubill scho wes delier, he bad,
And syne furth on his wayis raid;
And how scho furth suld cary it be,
Or euir he furth fur, ordanyt he.
This was a full gret curtesy,
That swik a king, and sa mighty,
Gert his men dwell on this maner
Bot for a pour laudner."

No one can fail to remark that, while the incident is in the highest degree honourable to Bruce, showing that the gentle heart may still be known by gentle deed, so also is Barbour entitled to the credit of humane feelings, from the way in which he had detailed and commented upon the transaction.

Barbour was the author of another considerable work, which has unfortunately perished. This was a chronicle of Scottish history, probably in the manner of that by Andrew Winton.

BARCLAY, ALEXANDER, a distinguished writer of the English tongue at the beginning of the sixteenth century, is known to have been a native of Scotland only by very obscure evidence. He spent some of

³ Article "Barbour," written by Dr. Irving, in *Encyclopedia Britannica*, 7th edition.

his earliest years at Croydon, in Surrey, and it is conjectured that he received his education at one of the English universities. In the year 1508 he was a prebendary of the collegiate church of St. Mary at Ottery, in Devonshire. He was afterwards a monk, first of the order of St. Benedict at Ely, and latterly of the order of St. Francis at Canterbury. While in this situation, and having the degree of Doctor of Divinity, he published an English translation of the *Mirror of Good Manners* (a treatise compiled in Latin by Dominyke Mancyn), for the use of the "juvent of England." After the Reformation Barclay accepted a ministerial charge in the Protestant church, as vicar of Much-Badew in Essex. In 1546 he was vicar of Wokey in Somersetshire, and in 1552 he was presented by the dean and chapter of London to the rectory of Allhallows in Lombard Street. Having reached an advanced age, he died in June this year, at Croydon in Surrey, where he was buried.

Barclay published a great number of books, original and translated, and is allowed by the most intelligent inquirers into early English literature to have done more for the improvement of the language than any of his contemporaries. His chief poetical work is *The Ship of Fools*, which was written in imitation of a German work entitled, *Das Narren Schiff*, published in 1494. *The Ship of Fools*, which was first printed in 1509, describes a vessel laden with all sorts of absurd persons, though there seems to have been no end in view but to bring them into one place, so that they might be described, as the beasts were brought before Adam in order to be named. We shall transcribe one passage from this work, as a specimen of the English style of Barclay: it is a curious contemporary character of King James IV. of Scotland.

"And, ye Christen princes, whosever ye be,
If ye be destitute of a noble captayne,
Take James of Scotland for his audacie
And proved manhode, if ye will laude attaine:
Let him have the forwarde: have ye no disdayne
Nor indignation: for never king was borne
That of ought of waure can shaw the uncoure.

For if that once he take the spere in hand
Agaynst these Turkes strongly with it to ride,
None shall be able his stroke for to withstande
Nor before his face so hardy to abide.
Yet this his manhode increaseth not his pride:
But ever sheweth meeknes and humilitie,
In worde or dede to hie and lowe degree."

Barclay also made a translation of Sallust's *History of the Jugurthine War*, which was published in 1557, five years after his death, and is one of the earliest specimens of English translation from the classics.

BARCLAY, JOHN, A.M., was the founder of a religious sect in Scotland, generally named Bereans, but sometimes called, from the name of this individual, Barclayans. The former title derived its origin from the habit of Mr. Barclay, in always making an appeal to the Scriptures, in vindication of any doctrine he advanced from the pulpit or which was contained in his writings. The perfection of the Scriptures, or of the Book of divine revelation, was the fundamental article of his system: at least this was what he himself publicly declared upon all occasions, and the same sentiments are still entertained by his followers. In Ac. xvii. 10 the Bereans are thus mentioned, "These were more noble than those in Thessalonica, in that they received the word with all readiness of mind, and searched the Scriptures daily, whether those things were so." These words were frequently quoted by Mr. Barclay. It ought to be observed, however, that originally it was not a name of reproach in-

vented by the malevolent part of the public, with the design of holding up Mr. Barclay and his associates to contempt, but was voluntarily assumed by them, to distinguish them from other sects of professed Christians.

Mr. Barclay was born in 1734. His father, Mr. Ludovic Barclay, was a farmer in the parish of Muthill, in the county of Perth. Being at an early age designed by his parents for the church, he was sent to school, and received the best education which that part of the country could afford. He was afterwards sent by his father to St. Andrews, where he regularly attended the literary and philosophical classes, and took the degree of A.M. At the commencement of the subsequent session, he entered the New Divinity or St. Mary's College, a seminary in which theology alone is taught. Nothing very particular occurred during his attendance at the hall, as it is generally called. He was uniformly regular in his private conduct, and though constitutionally of very impetuous passions and a fervid imagination, at no time of his life was he ever seduced into the practice of what was immoral or vicious. While he attended the lectures on divinity, the university of St. Andrews, and indeed the Church of Scotland in general, were placed in a very unpleasant situation, by the agitation of a question which originated with Dr. Archibald Campbell, professor of church history in St. Mary's College. He maintained "that the knowledge of the existence of God was derived from revelation, not from nature." This was long reckoned one of the errors of Socinus, and no one in Scotland, before Dr. Campbell's time, had ever disputed the opinion that was generally current, and consequently esteemed orthodox. He published his sentiments without the least reserve, and was equally ready to enter upon a vindication of them. He considered his view of the subject as a foundation necessary to be laid in order to demonstrate the necessity of revelation. A whole host of opponents volunteered against such dangerous sentiments; innumerable pamphlets rapidly made their appearance, and the hue and cry was so loud, that the ecclesiastical courts thought that they could no longer remain silent. Dr. Campbell was publicly prosecuted on account of his heretical opinions, but after long litigation the matter was compromised, and the only effect it produced was, that the students at St. Andrews in general became more zealous defenders of the doctor's system, though they durst not avow it so openly. Among others, Mr. Barclay had warmly espoused Dr. Campbell's system, and long before he left college he was noted as one of his most open and avowed partizans. These principles he never deserted, and in his view of Christianity it formed an important part of the system of revealed truth. It must not be imagined, however, that Mr. Barclay slavishly followed or adopted all Dr. Campbell's sentiments. Though they were both agreed that a knowledge of the true God was derived from revelation and not from nature, yet they differed upon almost every other point of systematic divinity. Mr. Barclay was early, and continued through life to be a high predestinarian, or what is technically denominated a supralapsarian, while Dr. Campbell, if one may draw an inference from some of his illustrations, leaned to Arminianism, and doubtless was not a decided Calvinist.

Mr. Barclay, having delivered the prescribed discourses, now directed his views to obtain license as a preacher in the Establishment, and having delivered the usual series of exercises with the entire approbation of his judges, he was, on the 27th September,

1759, licensed by the presbytery of Auchterarder. He was not long without employment. Mr. Jobson, then minister of Errol, near Perth, required an assistant, and Mr. Barclay from his popularity as a preacher easily obtained this situation. Here he remained for three or four years, until a rupture with his principal obliged him to leave it. Mr. Jobson was what may be called of the old school. He warmly espoused (as a great many clergymen of the Church of Scotland in those days did) the system of the *Marrow of Modern Divinity*, a book written by Edward Fisher, an English dissenter, about the middle of the seventeenth century, and republished in Scotland with notes by the celebrated Mr. Thomas Boston of Ettrick. For many years this book occasioned a most serious commotion in the Church of Scotland, which is generally called "the *Marrow* controversy." It was, indeed, the remote cause of that great division, which has since been styled the *Secession*. But there was another cause for the widening of this unfortunate breach. The well-known Mr. John Glass, minister of Tealing, near Dundee, had published, in 1727, a work entitled *The Testimony of the King of Martyrs*. With the exception of the Cameronians, this gentleman was the first dissenter from the Church of Scotland since the Revolution, and it is worthy of remark that the founders of the principal sects were all originally cast out of the church. Mr. Glass was an admirer of the writings of the most celebrated English Independents (of Dr. John Owen in particular), and of their form of church-government. Mr. Barclay, who was no Independent, heartily approved of many of his sentiments respecting the doctrines of the gospel, and as decidedly disapproved of others. He had a system of his own, and agreed with none of the parties; but this, if possible, rendered him more obnoxious to Mr. Jobson. Much altercation took place between them in private. Mr. Barclay publicly declared his sentiments from the pulpit, Mr. Jobson did the same in defence of himself, so that a rupture became unavoidable.

About the time of Mr. Barclay's leaving Errol, Mr. Anthony Dow, minister of Fettercairn, in the presbytery of Fordoun, found himself unfit for the full discharge of his duties. He desired his son, the Rev. David Dow, then minister of the parish of Dron, in the presbytery of Perth, to use his endeavour to procure him an assistant. Mr. Dow, who, we believe, was a fellow-student of Mr. Barclay at St. Andrews, and perfectly well acquainted with his talents and character, and the cause of his leaving Errol, immediately made offer to him of being assistant to his father. This he accepted, and he commenced his labours in the beginning of June, 1763. What were Mr. Anthony Dow's peculiar theological sentiments we do not know, but those of Mr. David Dow were not very different from Mr. Barclay's. Here he remained for nine years, which he often declared to have been the most happy, and considered to have been the most useful, period of his life.

Mr. Barclay was of a fair, and in his youth of a very florid, complexion. He then looked younger than he really was. The people of Fettercairn were at first greatly prejudiced against him on account of his youthful appearance. But this was soon forgotten. His fervid manner, in prayer especially, and at different parts of almost every sermon, rivetted the attention and impressed the minds of his audience to such a degree, that it was almost impossible to lose the memory of it. His popularity as a preacher became so great at Fettercairn, that anything of the like kind is seldom to be met with in the history of

the Church of Scotland. The parish church, being an old-fashioned building, had rafters across; these were crowded with hearers;—the sashes of the windows were taken out to accommodate the multitude who could not gain admittance. During the whole period of his settlement at Fettercairn, he had regular hearers who flocked to him from ten or twelve of the neighbouring parishes. If an opinion could be formed of what his manner had been in his youth, and at his prime, from what it was a year or two before he died, it must have been vehement, passionate, and impetuous to an uncommon degree. During his residence at Fettercairn he did not confine his labours to his public ministrations in the pulpit, but visited from house to house, was the friend and adviser of all who were at the head of a family, and entered warmly into whatever regarded their interests. He showed the most marked attention to children and to the young; and when any of the household were seized with sickness or disease, he spared no pains in giving tokens of his sympathy, and administered consolation to the afflicted. He was very assiduous in discharging those necessary and important duties which he thought were peculiarly incumbent upon a country clergyman. Such long-continued and uninterrupted exertions were accompanied with the most happy effects. A taste for religious knowledge, or what is the same, the reading and study of the Bible, began to prevail to a great extent; the morals of the people were improved, and temperance, sobriety, and regularity of behaviour sensibly discovered themselves throughout all ranks.

Mr. Barclay had a most luxuriant fancy, a great liking for poetry, and possessed considerable facility of versification. His taste, however, was far from being correct or chaste, and his imagination was little under the management of a sound judgment. Besides his works in prose, he published a great many thousand verses on religious subjects. He had composed a paraphrase of the whole book of Psalms, part of which was published in 1766. To this was prefixed, *A Dissertation on the best Means of Interpreting that Portion of the Canon of Scripture*. His views upon this subject were peculiar. He was of opinion that, in all the psalms which are in the first person, the speaker is Christ, and not David nor any other mere man, and that the other psalms describe the situation of the church of God, sometimes in prosperity, sometimes in adversity, and finally triumphing over all its enemies. This essay is characterized by uncommon vigour of expression, yet in some places with considerable acrimony. The presbytery of Fordoun took great offence at this publication, and summoned Mr. Barclay to appear at their bar. He did so, and defended himself with spirit and intrepidity. His opinions were not contrary to any doctrine contained in the *Confession of Faith*, so that he could not even be censured by them. Mr. Barclay, who being naturally of a frank, open, and ingenuous disposition, had no idea of concealing his opinions, not only continued to preach the same doctrines which were esteemed heretical by the presbytery, but published them in a small work, entitled *Rejoice evermore, or Christ All in All*. This obstinacy, as they considered it, irritated them to a very high degree. They drew up a warning against the dangerous doctrines that he preached, and ordered it to be read publicly in the church of Fettercairn after sermon, and before pronouncing the blessing, by one of their own members, expressly appointed for that purpose, on a specified day, which was accordingly done. Mr. Barclay viewed their conduct with indifference

mingled with contempt, and no effect of any kind resulted from the warning to the people of Fettercairn, who were unanimous in their approbation of Mr. Barclay's doctrine. He continued during Mr. Dow's lifetime to instruct the people of his parish, and conducted his weekly examinations to the great profit of those who gave attendance.

In 1769 he published one of the largest of his treatises, entitled *Without Faith without God, or an Appeal to God concerning his own Existence*. This was a defence of similar sentiments respecting the evidence in favour of the existence of God, which were entertained by Dr. Campbell already mentioned. The illustrations are entirely Calvinistical. This essay is not very methodical. It contains, however, a great many acute observations, and sarcastic remarks upon the systems of those who have adopted the generally current notions respecting natural religion. In the course of the same year, 1769, he addressed a letter on the *Eternal Generation of the Son of God*, to Messrs. Smith and Ferrier. These two gentlemen had been clergymen in the Church of Scotland. They published their reasons of separation from the Established church. They had adopted all the sentiments of Mr. Glass, who was a most strict Independent, and both of them died in the Glassite communion. Dr. Dalgliesh of Peebles had, about the time of their leaving the church, published a new theory respecting the sonship of Christ, and, what is not a little singular, it had the merit of originality, and had never before occurred to any theologian. He held the tri-personality of Deity, but denied the eternal Sonship of the second person of the Godhead, and was of opinion that this *filiation* only took place when the divine nature was united to the human, in the person of Christ, Immanuel, God with us. Novel as this doctrine was, all the Scottish Independents, with a very few exceptions, embraced it. The difference between Dalgliesh and the Arians consists in this, that the second person of the Trinity, according to him, is God, equal with the Father; whilst the latter maintain, in a certain sense, his supreme exaltation, yet they consider him as subordinate to the Father. Mr. Barclay's letter states very clearly the scriptural arguments usually adduced in favour of the eternal generation of the Son of God. It is written with great moderation and in an excellent spirit.

In 1771 he published a letter, *On the Assurance of Faith*, addressed to a gentleman who was a member of Mr. Cudworth's congregation in London. Cudworth was the person who made a distinguished figure in defending the celebrated Mr. Hervey against the acrimonious attack of Mr. Robert Sandeman, who was a Glassite. Excepting in some peculiar forms of expression, Cudworth's views of the assurance of faith did not materially differ from Mr. Barclay's. There appeared also in the same year *A Letter on Prayer*, addressed to an Independent congregation in Scotland.

The Rev. Anthony Dow, minister of Fettercairn, died in 1772. The presbytery of Fordoun seized this opportunity of gratifying their spleen; they prohibited Mr. Barclay from preaching in the kirk of Fettercairn, and used all their influence to prevent him from being employed, not only within their bounds, which lie in what is called the Mearns, but they studied to defame him in all quarters. The clergy of the neighbouring district, that is, in Angus, were much more friendly. They were ready to admit him into their pulpits, and he generally preached every Lord's-day, during the subsequent autumn, winter, and spring. Multitudes from all parts of the country crowded to hear him. The patronage

of Fettercairn is in the gift of the crown. The parish almost unanimously favoured Mr. Barclay. They were not, however, permitted to have any choice, and the Rev. Robert Foote, then minister of Eskdale Muir, was presented. At the moderation of the call, only three signed in favour of Mr. Foote. The parishioners appealed to the synod, and from the synod to the General Assembly, who ordered Mr. Foote to be inducted. The presbytery carried their hostility against Mr. Barclay so far, as to refuse him a certificate of character, which is always done, as a matter of course, when a preacher leaves their bounds. He appealed to the synod, and afterwards to the Assembly, who found (though he was in no instance accused of any immorality) that the presbytery were justified in withholding the certificate. He had no alternative, and therefore left the communion of the Church of Scotland. A great many friends in Edinburgh, who had adopted his peculiar sentiments, formed themselves into a church, and urged him to become their pastor. The people of Fettercairn also solicited him to labour in the ministry amongst them; but for the present he declined both invitations. Having hitherto held only the status of a probationer or licentiate, he visited Newcastle, and was ordained there, October 12th, 1773. The certificate of ordination is signed by the celebrated James Murray of Newcastle, the author of the well-known *Sermons to Asses*, which contain a rich vein of poignant satire, not unworthy of Swift. It was also signed by Robert Somerville of Weardale, and James Somerville of Swallowell, and Robert Green, clerk. His friends at Fettercairn meanwhile erected a place of worship at Sauchyburn, in the immediate neighbourhood, and renewed their application to have him settled amongst them. But Mr. Barclay, conceiving that his sphere of usefulness would be more extended were he to reside in Edinburgh, gave the preference to the latter. Mr. James M'Rae, having joined Mr. Barclay, was ordained minister at Sauchyburn in spring, 1774. The congregation there, at this time, consisted of from 1000 to 1200 members.

Mr. Barclay remained in Edinburgh about three years; and was attended by a numerous congregation, who had adopted his views of religious truth. But having a strong desire to disseminate his opinions, he left the church at Edinburgh under the care of his elders and deacons, and repaired to London. For nearly two years he preached there, as well as at Bristol, and other places in England. A church was formed in the capital. He also established there a debating society, which met weekly in the evening, for the purpose of disputing with any who might be disposed to call his doctrines in question. One of those who went with the design of impugning Mr. Barclay's opinions was Mr. William Nelson, who eventually became a convert. This gentleman had been educated in the Church of England, but when Mr. Barclay came first to London, had joined the Whitefieldian or Calvinistic Methodists. He afterwards came to Scotland, was connected with Mr. Barclay, practised as a surgeon in Edinburgh, and delivered lectures on chemistry there, for about ten years. He was a man of considerable abilities, amiable in private life, and of the most unblemished character. He was cut off by apoplexy in 1800.

At Edinburgh Mr. Barclay published an edition of his works in three volumes, including a pretty large treatise on the *Sin against the Holy Ghost*, which, according to him, is merely unbelief or discrediting the Scripture. In 1783 he published a small work for the use of the Berean churches, *The Epistle to the Hebrews Paraphrased*, with a collection

of psalms and songs from his other works, accompanied with *A Close Examination into the Truth of several received Principles*.

Mr. Barclay died on the 29th of July, 1798. Being Sabbath, when on his road to preach, he felt himself rather unwell; he took a circuitous route to the meeting-house, but finding himself no better, he called at the house of one of the members of his congregation. In a few minutes after he entered the house, while kneeling in prayer beside a chair, he expired without a groan, in the sixty-fourth year of his age, and thirty-ninth of his professional career. His nephew Dr. John Barclay was immediately sent for, who declared his death to have been occasioned by apoplexy. He was interred in the Calton old burying-ground, Edinburgh, where a monument has been erected to his memory. Mr. Barclay was a very uncommon character, and made a great impression upon his contemporaries.

There are Berean churches in Edinburgh, Glasgow, Creeff, Kirkcaldy, Dundee, Arbroath, Montrose, Brechin, Fettercairn, and a few other places.

BARCLAY, JOHN, M.D., an eminent lecturer on anatomy, was the nephew of John Barclay, the Berean, after whom he was named. He was born in 1759, or 1760, at Cairn, near to Drummaquhance, in Perthshire. His father was a respectable farmer in that part of the country, and was characterized by great natural shrewdness and vivacity. His son John was educated at the parish school of Muthill, and early distinguished himself by his superior powers of mind, and by his application. Being destined for the church, he in 1776 repaired to the university of St. Andrews, where he became a successful candidate for a bursary. He made great proficiency in the Greek language, and also discovered a partiality for the study of mathematics, although he does not appear to have prosecuted this important branch of science. After having attended the usual preliminary classes at the united college of St. Salvador and St. Leonard, Barclay studied divinity in St. Mary's, attaching himself to the moderate party in the church. He studied divinity at St. Andrews, under the professor, Dr. Spence, for two or three sessions, but having engaged to teach a school, he found it more convenient to deliver the prescribed exercises before the professor in Edinburgh. On one of these occasions there took place a very singular occurrence, which the doctor himself used to relate. Having come to Edinburgh for the express purpose of delivering a discourse in the hall, he waited upon his uncle, who was an excellent scholar. It was what is called "an exercise and addition," or a discourse, in which the words of the original are criticised—the doctrines they contain illustrated—and it is concluded by a brief paraphrase. He proposed to read it to his uncle before he delivered it—and when he was in the act of doing so, his respected relative objected to a criticism which he had introduced, and endeavoured to show that it was contrary to several passages in the writings of the apostle Paul. The doctor had prepared the exercise with great care, and had quoted the authority of Xenophon in regard to the meaning of the word. The old man got into a violent passion at his nephew's obstinacy, and seizing a huge folio that lay on the table, hurled it at the recusant's head, which it fortunately missed. Barclay, who really had a great esteem for his uncle, related the anecdote to a clergyman a few days after it happened, and laughed very heartily at it. Barclay wrote about this time, *A History of all Religions*, but of this no trace was to be found among his manuscripts.

Having delivered with approbation his trial discourses, he obtained license from the presbytery of Dunkeld. Meanwhile he acted as tutor to the two sons of Sir James Campbell, of Aberuchill, whose daughter, Eleonora, in 1811, became his wife. In 1789 he accompanied his pupils to Edinburgh, where he preached occasionally for his friends. The medical school of Edinburgh was then at the height of its reputation. Cullen's brilliant career was drawing to a close, and he was succeeded by the celebrated Dr. Gregory. Dr. Black and the second Monro still shed lustre on their respective departments. Barclay was principally attracted to the anatomical class by the luminous prelections of Dr. Monro, and appears to have thenceforward devoted himself to a complete course of medical study. In 1796 he took the degree of M.D., choosing as the subject of his thesis *De Anima, seu Principio Vitæ*, the vital principle having long been with him a favourite topic of speculation. After graduation, Dr. Barclay proceeded to London, and attended the anatomical lectures of Dr. Marshall, of Thavies Inn. In 1797 he commenced a course of private lectures on anatomy in a small class-room in the High-school yards, Edinburgh, but had to contend with formidable difficulties; the popularity of the second Monro and of John Bell being still undiminished amongst the students. Dr. Barclay, therefore, had few students at first; but he resolved to persevere. The introductory lectures (which, after his death, were published by his friend, Sir George Bellingall, M.D.) were prepared with scrupulous care. He studied to express himself in plain and perspicuous language, which he justly esteemed to be the chief quality of style in lecturing. His illustrations were clear and copious, and not unfrequently an apposite anecdote fixed more strongly in the memories of his pupils the particular part he was demonstrating; and, at a time when it was by no means fashionable, he never omitted to point out the wisdom of God, as displayed in that most wonderful of all his works, the formation and support of the human body.

Barclay's first literary performance was the article "Physiology," in the third edition of the *Encyclopædia Britannica*. In 1803 he published a new anatomical nomenclature. This had been long the subject of his meditation, and was a great desideratum in anatomy. The vagueness or indefinite nature of the terms of anatomy has been perceived and regretted by all anatomists. They have produced much ambiguity and confusion in anatomical descriptions, and their influence has been strongly felt, particularly by those who have just entered upon the study. Barclay was the first who, fully aware of the obstacles that were thus thrown in the way of students, set about inventing a new nomenclature. The vagueness of the terms principally referred to those implying position, aspect, and direction. Thus, what is superior in one position of the body, becomes anterior in another, posterior in a third, and even inferior in a fourth. What is external in one position is internal in another, &c. These terms become much more ambiguous in comparative anatomy. His object was to contrive a nomenclature, in which the same terms should universally apply to the same organ, in all positions of the body, and in all animals. It is the opinion of very candid judges that he has succeeded in his endeavour, and that, were his nomenclature adopted, the greatest advantages would accrue to the study of the science. The proposal is delivered with singular modesty, and discovers both a most accurate knowledge of anatomy and great ingenuity.

In 1808 appeared his work on the muscular

motions of the human body, and in 1812 a description of the arteries of the human body—both of which contain a most complete account of those parts of the system. These three works were dedicated to the late Dr. Thomas Thomson, professor of chemistry in the university of Glasgow. The last work which Dr. Barclay lived to publish, was an inquiry into the opinions, ancient and modern, concerning life and organization. This, as we have mentioned, formed the subject of his thesis.

He also delivered, during several summers, a course of lectures on comparative anatomy, a branch of study for which he had always shown a marked partiality—not only as an object of scientific research, but as of great practical utility. At one time he proposed to the town council, the patrons of the university of Edinburgh, to be created professor of that department of the science; how the proposal was received is not known. The writer of the memoir of Dr. Barclay, in the *Naturalist's Library*, furnishes a characteristic illustration of the lively interest he felt in the dissections of uncommon animals which came in his way in the Scottish metropolis. "At one of these we happened to be present. It was the dissection of a beluga, or white whale. Never shall we forget the enthusiasm of the doctor wading to his knees amongst the viscera of the great tenant of the deep, alternately cutting away with his large and dexterous knife, and regaling his nostrils with copious infusions of snuff, while he pointed out, in his usual felicitous manner, the various contrasts or agreements of the forms of the viscera with those of other animals and of man." Barclay was the means of establishing, under the auspices of the Highland Society, a veterinary school in Edinburgh. He might be called an enthusiast in his profession: there was no branch of anatomy, whether practical or theoretical, that he had not cultivated with the utmost care; he had studied the works of the ancient and modern, foreign and British, anatomists with astonishing diligence. Whatever related to natural science was certain of interesting him. The benevolence and generosity of his temper were also unbounded. No teacher was ever more generally beloved by his pupils than Dr. Barclay, to which his uniform kindness and affability, and readiness to promote their interest upon every occasion, greatly contributed. Many young men in straitened circumstances were permitted to attend his instructions gratuitously; and he has even been known to furnish them with the means of seeing other lecturers.

It is a curious circumstance, that Dr. Barclay often declared that he had neither the sense of taste nor of smell.

His last appearance in the lecture-room was in 1825, when he delivered the introductory lecture. He died 21st August, 1826, and was buried at Restalrig, near Edinburgh, the family burying-ground of his father-in-law Sir James Campbell. His funeral was attended by the Royal College of Surgeons as a body.

A bust of Dr. Barclay, subscribed for by his pupils, and executed by Joseph, was presented to the College of Surgeons, to which he bequeathed his museum—a valuable collection of specimens, particularly in comparative anatomy, and which is to retain his name. His design in this legacy was to prevent it from being broken up and scattered after his death.

BARCLAY, JOHN, son of William Barclay, was born at Pontamousson in France, January 28, 1582, and was educated under the care of Jesuits. When

only nineteen years old, he published notes on the *Thebais* of Statius. He was the innocent cause of a quarrel between his father and the Jesuits, in consequence of which the family removed to England, in 1603. At the beginning of the year 1604 young Barclay presented a poetical panegyric to the king, under the title of *Kalendar Januaria*. To this monarch he soon after dedicated the first part of his celebrated Latin satire entitled *Euphormion*. John Barclay, like many young men of genius, was anxious for distinction, *quocumque modo*, and, having an abundant conceit of his own abilities, and looking upon all other men as only fit to furnish him with matter of ridicule, he launched at the very first into the dangerous field of general satire. He confesses in the *Apology* which he afterwards published for his *Euphormion*, that, "as soon as he left school, a juvenile desire of fame incited him to attack the whole world, rather with a view of promoting his own reputation than of dishonouring individuals." We must confess that this grievous early fault of Barclay was only the transgression of a very spirited character. He says, in his dedication of *Euphormion* to King James, written when he was two-and-twenty, that he was ready, in the service of his majesty, to convert his pen into a sword, or his sword into a pen. His prospects at this court were unfortunately blighted, like those of his father, by the religious contests of the time; and in 1604 the family returned to France. John, however, appears to have spent the next year chiefly in England, probably upon some renewal of his prospects at the court of King James. In 1606, after the death of his father, he returned to France, and at Paris married Louisa Debonnaire, with whom he soon after settled at London. Here he published the second part of his *Euphormion*, dedicating it to the Earl of Salisbury, a minister in whom he could find no fault but his *excess of virtue*. Lord Hailes remarks, as a surprising circumstance, that the writer who could discover no faults in Salisbury, aimed the shafts of ridicule at Sully; but nothing can be less surprising in such a person as Barclay. A man who satirized only for the sake of personal *clat*, would as easily flatter in gratitude for the least note. It should also be recollected, that many minds do not, till the approach of middle life, acquire the power of judging accurately regarding virtue and vice, or merit and demerit: all principles, in such minds, are jumbled like the elements of the earth in chaos, and are only at length reduced to order by the overmastering influence of the understanding. In the disposition which seems to have characterized Barclay for flattering those who patronised him, he endeavoured to please King James, in the second part of the *Euphormion*, by satirizing tobacco and the Puritans. In this year he also published an account of the Gunpowder Plot, a work remarked to be singularly impartial, considering the religion of the writer. During the course of three years' residence in England, Barclay received no token of the royal liberality. Sunk in indigence, with an increasing family calling for support, he only wished to be indemnified for his English journeys, and to have his charges defrayed into France. At length he was relieved from his distresses by his patron Salisbury. Of these circumstances, so familiar and so discouraging to men of letters, we are informed by some allegorical and obscure verses written by Barclay at that sad season. Having removed to France in 1609, he next year published his *Apology for the Euphormion*. This denotes that he came to see the folly of a general contempt for mankind at the age of twenty-eight. How he supported himself at this time

does not appear; but he is found, in 1614, publishing his *Icon Animarum*, which is declared by a competent critic to be the best, though not the most celebrated, of his works. It is a delineation of the genius and manners of the European nations, with remarks, moral and philosophical, on the various tempers of men. It is pleasant to observe that in this work he does justice to the Scottish people. In 1615 Barclay is said to have been invited by Pope Paul V. to Rome. He had previously lashed the holy court in no measured terms; but so marked a homage from this quarter to his distinction in letters, as usual, softened his feelings, and he now accordingly shifted his family thither, and lived the rest of his life under the protection of the pontiff. In 1617 he published at Rome his *Parænesis ad Sæctarios, Libro Duo*; a work in which he seems to have aimed at atoning for his former sarcasms at the pope, by attacking those whom his holiness called heretics. Barclay seems to have been honoured with many marks of kindness, not only from the pope, but also from Cardinal Barberini; yet it does not appear that he obtained much emolument. Incumbered with a wife and family, and having a spirit above his fortune, this omission must have been peculiarly trying. It was at that time that he composed his Latin romance called *Argenis*. He employed his vacant hours in cultivating a flower garden; and Rossi relates, in his turgid Italian style, that Barclay cared not for those bulbous roots which produce flowers of a sweet scent, but cultivated such as produced flowers void of smell, but having variety of colours. Hence we may conclude that he was among the first of those who were infected with that strange disease, a passion for tulips, which soon after overspread Europe, and is commemorated under the name of the *tulipo-mania*. Barclay might truly have said with Virgil, "*Tantus amor florum!*" He had two mastiffs placed as sentinels to protect his garden; and rather than abandon his favourite flowers, chose to continue his residence in an ill-aired and unwholesome situation.

This extraordinary genius, who seems to have combined the *perfervidum ingenium* of his father's country with the mercurial vivacity of his mother's, died at Rome on the 12th of August, 1621, in the thirty-ninth year of his age. He left a wife, who had tormented him much with jealousy (through the ardour of her affection, as he explained it), besides three children, of whom two were boys. He also left in the hands of the printer his celebrated *Argenis*, and also an unpublished history of the conquest of Jerusalem, and some fragments of a general history of Europe. He was buried in the church of St. Omphrius, and his widow erected a monument to him, with his bust in marble, at the church of St. Lawrence, on the road to Tivoli. A strange circumstance caused the destruction of this trophy. Cardinal Barberini chanced to erect a monument, exactly similar, at the same place, to his preceptor, *Bernardus Gulienus a monte Sancti Sabini*. When the widow of Barclay heard of this, she said, "My husband was a man of birth, and famous in the literary world; I will not suffer him to remain on a level with a base and obscure pedagogue." She therefore caused the bust to be removed, and the inscription to be obliterated. The account given of the *Argenis* by Lord Hailes, who wrote a life of John Barclay as a specimen of a *Biographia Scotica*,¹ is as follows: "*Argenis* is generally supposed to be a history under feigned names, and not a romance.

Barclay himself contributed to establish this opinion, by introducing some real characters into the work. But that was merely to compliment certain dignitaries of the church, whose good offices he courted, or whose power he dreaded. The key prefixed to *Argenis* has perpetuated the error. There are, no doubt, many incidents in it that allude to the state of France during the civil wars in the seventeenth century; but it requires a strong imagination indeed to discover Queen Elizabeth in Hyannisbe, or Henry III. of France in Meleander." On the whole, *Argenis* appears to be a poetical fable, replete with moral and political reflections. Of this work three English translations have appeared, the last in 1772; but it now only enjoys the reflective reputation of a work that was once in high repute. We may quote, however, the opinion which Cowper was pleased to express regarding this singular production. "It is," says the poet of Olney, "the most amusing romance that ever was written. It is the only one, indeed, of an old date, that I had ever the patience to go through with. It is interesting in a high degree, richer in incident than can be imagined, full of surprises, which the reader never foresees, and yet free from entanglement and confusion. The style too appears to me to be such as would not dishonour Tacitus himself."

BARCLAY, ROBERT, the celebrated apologist for the Quakers, was born on the 23d of December, 1648, at Gordonstoun, in Moray. His father, Colonel David Barclay, of Ury, was the son of David Barclay of Mathers, the representative of an old Scots-Norman family, which traced itself, through fifteen intervening generations, to Theobald de Berkeley, who acquired a settlement in Scotland at the beginning of the twelfth century. The mother of the apologist was Catherine Gordon, daughter of Sir Robert Gordon of Gordonstoun, the premier baronet of Nova Scotia, and well-known historian of the house of Sutherland.

The ancient family of De Berkeley became possessed of the estate of Mathers, by marriage, in the year 1351. Alexander de Berkeley, who flourished in the fifteenth century, is said to have been the first laird of Mathers who changed the name to Barclay. David, the grandfather of the apologist, was reduced to such difficulties as to be obliged to sell the estate of Mathers, after it had been between two and three hundred years in the family, as also the more ancient inheritance, which had been the property of the family from its first settlement in Scotland in the days of King David I. His son David, the father of the apologist, was consequently obliged to seek his fortune as a volunteer in the Scottish brigades in the service of Gustavus Adolphus, King of Sweden. This gentleman, like many others of his countrymen and fellow-soldiers, returned home on the breaking out of the religious troubles in Scotland, and received the command of a troop of horse. Having joined the army raised by the Duke of Hamilton in 1648 for the relief of Charles I., he was subsequently deprived of his command, at the instance of Oliver Cromwell; and he never afterwards appeared in any military transactions. During the protectorate, he was several times sent as a representative from Scotland to Cromwell's parliaments, and, in this capacity, is said to have uniformly exerted himself to repress the ambitious designs of the protector. After the restoration, David Barclay was committed prisoner to Edinburgh Castle, upon some groundless charge of hostility to the government. He was soon after liberated, through the interest of the Earl of Middleton, with whom he had served in the civil

¹ Printed in 4to, in 1782, and the ground-work of the present sketch.

war. But during this imprisonment, a change of the highest importance, both to himself and his son, had come over his mind. In the same prison was confined the celebrated laird of Swinton, who, after figuring under the protectorate as a lord of session, and a zealous instrument for the support of Cromwell's interest in Scotland, had, during a short residence in England before the restoration, adopted the principles of Quakerism, then recently promulgated for the first time by George Fox, and was now more anxious to gain proselytes to that body than to defend his life against the prosecution that awaited him. When this extraordinary person was placed on trial before parliament, he might have easily eluded justice by pleading that the parliamentary attainder upon which he was now charged had become null by the rescissory act. But he scorned to take advantage of any plea suggested by worldly lawyers. He answered, in the spirit of his sect, that when he committed the crimes laid to his charge he was in the gall of bitterness and bond of iniquity, but that God having since called him to the light, he saw and acknowledged his past errors, and did not refuse to pay the forfeit of them, even though in their judgment this should extend to his life. His speech was, though modest, so majestic, and, though expressive of the most perfect patience, so pathetic, that it appeared to melt the heart of his judges, and, to the surprise of all who remembered his past deeds, he was recommended to the royal mercy, while many others, far less obnoxious, were treated with unrelenting severity. Such was the man who inoculated David Barclay with those principles of which his son was destined to be the most distinguished advocate.

Robert Barclay, the subject of the present article, received the rudiments of learning in his native country, and was afterwards sent to the Scots college at Paris, of which his uncle Robert (son to the last Barclay of Mathers) was rector. Here he made such rapid advances in his studies, as to gain the notice and praise of the masters of the college; and he also became so great a favourite with his uncle, as to receive the offer of being made his heir, if he would remain in France. But his father, fearing that he might be induced to embrace the Catholic faith, went, in compliance with his mother's dying request, to Paris to bring him home, when he was not much more than sixteen years of age. The uncle still endeavoured to prevent his return, and proposed to purchase for him, and present to him immediately, an estate greater than his paternal one. Robert replied, "He is my father, and must be obeyed." Thus, even at a very early age, he showed how far he could prefer a sacred principle to any view of private interest, however dazzling. His uncle is said to have felt much chagrin at his refusal, and to have consequently left his property to the college and to other religious houses in France.

The return of Robert Barclay to his native country took place in 1664, about two years before his father made open profession of the principles of the Society of Friends. He was now, even at the early age of sixteen, perfectly skilled in the French and Latin languages, the latter of which he could write and speak with wonderful fluency and correctness; he had also a competent knowledge of the sciences. With regard to the state of his feelings on the subject of religion at this early period of life; he says, in his *Treatise on Universal Love*: "My first education, from my infancy, fell amongst the strictest sort of Calvinists; those of our country being generally acknowledged to be the severest of that sect; in the heat of zeal surpassing not only Geneva, from whence

they derive their pedigree, but all other the reformed churches abroad, so called. I had scarce got out of my childhood, when I was, by the permission of divine providence, cast among the company of Papists; and my tender years and immature capacity not being able to withstand and resist the insinuations that were used to proselyte me to that way, I became quickly defiled with the pollutions thereof, and continued therein for a time, until it pleased God, through his rich love and mercy, to deliver me out of those snares, and to give me a clear understanding of the evil of that way. In both these sects I had abundant occasion to receive impressions contrary to this principle of *love*: seeing the straitness of several of their doctrines, as well as their practice of persecution, do abundantly declare how opposite they are to universal love. The time that intervened betwixt my forsaking the Church of Rome, and joining those with whom I now stand engaged, I kept myself free from joining with any sort of people, though I took liberty to hear several; and my converse was most with those that inveigh much against *judging*, and such kind of severity; which latitude may perhaps be esteemed the other extreme, opposite to the preciseness of these other sects; whereby I also received an opportunity to know what usually is *pretended* on that side likewise. As for those I am now joined to, I justly esteem them to be the true followers and servants of Jesus Christ."

In his *Apology* he communicates the following account of his conversion to the principles previously embraced by his father. "It was not," he says, "by strength of argument, or by a particular disquisition of each doctrine, and conviction of my understanding thereby, that I came to receive and bear witness of the truth, but by being secretly reached by this life. For when I came into the silent assemblies of God's people, I felt a secret power amongst them which touched my heart; and as I gave way unto it, I found the evil weakening in me, and the good raised up; and so I became thus knit and united unto them, hungering more and more after the increase of this power and life, whereby I might find myself perfectly redeemed." According to his friend William Penn, it was in the year 1667, when only nineteen years of age, that he fully became "convinced, and publicly owned the testimony of the true light, enlightening every man." "This writer," says he, "came early forth a zealous and fervent witness for it [the true light], enduring the cross and despising the shame that attended his discipleship, and received the gift of the ministry as his greatest honour, in which he laboured to bring others to God, and his labour was not in vain in the Lord." The true grounds of Barclay's predilection for the meek principles of the Friends is perhaps to be found in his physical temperament. On arriving in Scotland, in 1664, with a heart open to every generous impulse, his mild nature appears, from one of the above extracts of his own writings, to have been shocked by the mutual hostility which existed between the adherents of the established and the dis-established churches. While these bodies *judged* of each other in the severest spirit, they joined in one point alone—a sense of the propriety of persecuting the new and strange sect called Quakers, from whom both might rather have learned a lesson of forbearance and toleration. Barclay, who, from his French education, was totally free of all prejudices on either side, seems to have deliberately preferred that sect which alone, of all others in his native country, professed to regard every denomination of fellow-Christians with an equal feeling of kindness.

In February, 1669-70, Robert Barclay married

Christian Mollison, daughter of Gilbert Mollison, merchant in Aberdeen; and on his marriage settled at Ury with his father. The issue of this marriage was three sons and four daughters, all of whom survived him, and were living fifty years after his death. Robert Barclay after his marriage lived about sixteen years with his father; in which time he wrote most of those works by which his fame has been established. All his time, however, was not passed in endeavouring to serve the cause of religion with his pen. He both acted and suffered for it. His whole existence, indeed, seems to have been henceforth devoted to the interests of that profession of religion which he had adopted. In prosecution of his purpose, he made a number of excursions into England, Holland, and particular parts of Germany; teaching, as he went along, the universal and saving light of Christ, sometimes vocally, but as often, we may suppose, by what he seems to have considered the far more powerful manner, expressive silence. In these peregrinations, the details of which, had they been preserved, would have been deeply interesting, he was on some occasions accompanied by the famous William Penn, and probably also by others of the brethren.

The first of his publications in the order of time was, "*Truth cleared of Calumnies*, occasioned by a book entitled *A Dialogue between a Quaker and a Stable Christian*, written by the Rev. William Mitchell, a minister or preacher in the neighbourhood of Aberdeen." "The Quakers," says a defender of the Scottish church, "were, at this time, only newly risen up; they were, like every new sect, obtrusively forward; some of their tenets were of a startling and some of them of an incomprehensible kind, and to the rigid Presbyterians especially they were exceedingly offensive. Hearing these novel opinions, not as simply stated and held by the Quakers, who were, generally speaking, no great logicians, but in their remote consequences, they regarded them with horror, and in the heat of their zeal, it must be confessed, often lost sight both of charity and truth. They thus gave their generally passive opponents great advantages over them. Barclay, who was a man of great talents, was certainly in this instance successful in refuting many false charges, and rectifying many forced constructions that had been put upon parts of their practice, and, upon the whole, setting the character of his silent brethren in a more favourable light than formerly; though he was far from having demonstrated, as these brethren fondly imagined, 'the soundness and Scripture verity of their principles.'" This publication was dated at Ury, the 19th of the second month, 1670, and in the eleventh month of the same year, he added to it, by way of appendix, "Some things of weighty concernment proposed in meekness and love, by way of queries, to the serious consideration of the inhabitants of Aberdeen, which also may be of use to such as are of the same mind with them elsewhere in this nation." These queries, twenty in number, were more particularly directed to Messrs. David Lyal, George Meldrum, and John Menzies, the ministers of Aberdeen, who had, not only from the pulpit forbidden their people to read the aforesaid treatise, but had applied to the magistrates of Aberdeen to suppress it. Mitchell wrote a reply to *Truth cleared of Calumnies*, and on the 24th day of the tenth month, 1671, Barclay finished a rejoinder at Ury, under the title of *William Mitchell Unmasked, or the Staggering Instability of the Pretended Stable Christian Discovered; his Omissions Observed, and Weakness Unveiled*, &c. This goes over the same ground with the former treatise, and is seasoned

with several severe strokes of sarcasm against these Aberdonians, who, "notwithstanding they had sworn to avoid a *detestable neutrality*, could now preach under the bishop, dispense with the doxology, forbear lecturing and other parts of the directorial discipline, at the bishop's order, and yet keep a reserve for presbytery in case it came again in fashion." He also turns some of William Mitchell's arguments against himself with great ingenuity, though still he comes far short of establishing his own theory. It is worthy of remark, that, in this treatise, he has frequent recourse to Richard Baxter's aphorisms on justification, whose new law scheme of the gospel seems to have been very much to the taste of the Quaker. It appears to have been on the appearance of this publication that, "for a sign and wonder to the generation," he walked through the chief streets of the city of Aberdeen, clothed in sackcloth and ashes; on which occasion he published (in 1672) a *Seasonable Warning and Serious Exhortation to, and Expostulation with, the Inhabitants of Aberdeen, concerning this present Dispensation and Day of God's Living Visitation towards them*.

His next performance was, *A Catechism and Confession of Faith*, the answers to the questions being all in the express words of Scripture; and the preface to it is dated, "From Ury, the place of my being, in my native country of Scotland, the 11th of the sixth month, 1673." This was followed by *The Anarchy of the Ranters*, &c.

We now come to his great work, "*An Apology for the true Christian Divinity, as the same is held forth and preached by the People called in scorn Quakers*:" being a full explanation and vindication of their principles and doctrines, by many arguments deduced from Scripture and right reason, and the testimonies of famous authors, both ancient and modern; with a full answer to the strongest objections usually made against them. Presented to the king. Written and published in Latin for the information of strangers, by Robert Barclay, and now put into our own language for the benefit of his countrymen." The epistle to the king, prefixed to this elaborate work, is dated, "From Ury, the place of my pilgrimage, in my native country of Scotland, the 25th of the month called November, 1675." This epistle is not a little curious, among other things, for the ardent anticipations which the writer indulges with regard to the increase and future prevalence of the doctrines of the Quakers, which he calls "the gospel now again revealed after a long and dark night of apostasy, and commanded to be preached to all nations." After some paragraphs, sufficiently complimentary to the peaceable habits of his silence-loving brethren, he tells his majesty that "generations to come will not more admire that singular step of Divine Providence, in restoring thee to thy throne without bloodshed, than they shall admire the increase and progress of this truth without all outward-help, and against so great opposition, which shall be none of the least things rendering thy memory remarkable." In looking back upon the atrocities that marked the reign of Charles II., the growth of Quakerism is scarcely ever thought of, and the sufferings of its professors are nearly invisible, by reason of the far greater sufferings of another branch of the Christian church. Though led by his enthusiasm in his own cause to overrate it, Barclay certainly had no intention of flattering the king. "God," he goes on to tell him, "hath done great things for thee; he hath sufficiently shown thee that it is by him princes rule, and that he can pull down and set up at his pleasure. Thou hast tasted of prosperity and adversity; thou knowest what it is to be banished thy native country,

to be overruled as well as to rule and sit upon the throne, and being oppressed thou hast reason to know how hateful the oppressor is, both to God and man. If after all these warnings and advertisements, thou dost not turn unto the Lord with all thy heart, but forget him who remembered thee in thy distress, and give up thyself to lust and vanity, surely great will be thy condemnation."

The *Apology* is a most elaborate work, indicating no small portion of both talent and learning. It contains, indeed, the sum of the author's thoughts in those treatises we have already mentioned, as well as in those which he afterwards published, digested into fifteen propositions, in which are included all the peculiar notions of the sect:—immediate revelation; the universal spiritual light; silent worship; perfection; the rejection of the Sabbath and the sacraments, &c. &c. This is done with great apparent simplicity, and many plausible reasons, a number of excellent thoughts being struck out by the way; yet they are far from being satisfactory, and never will be so to any who are not already strongly possessed with an idea of the internal light in man, to which the author holds even the Scriptures themselves to be subordinate. There are, indeed, in the book, many sophisms, many flat contradictions, and many assertions that are incapable of any proof. The appeals which he makes to his own experience for the proof of his doctrines are often not a little curious, and strongly illustrative of his character, as well as of the principles he had adopted.

The same year in which he published the *Apology*, he published an account of a dispute with the students of Aberdeen, which touches little besides the folly of such attempts to establish truth or confute error. The following year, in conjunction with George Keith, he put forth a kind of second part to the foregoing article, which they entitled *Quakerism Confirmed, being an answer to a pamphlet by the Aberdeen Students, entitled Quakerism Conrassed*. This treats only of matters to be found in a better form in the *Apology*. In the first month of the year 1677, from Aberdeen prison, he wrote his treatise of *Universal Love*; and in the end of the same year he wrote from his house at Ury, *An Epistle of Love and Friendly Advice to the Ambassadors of the several Princes of Europe, met at Nimeguen, to consult the peace of Christendom so far as they are concerned; wherein the true cause of the present war is discovered, and the right remedy and means for a firm and settled peace is proposed*. This last was written in Latin, but published also in English for the benefit of his countrymen. Both of the above tracts deserve serious perusal. In 1679 he published a vindication of his *Apology*; and in 1686 his last work, *The Possibility and Necessity of the Inward and Immediate Revelation of the Spirit of God towards the foundation and ground of true faith; in a letter to a person of quality in Holland*; published both in Latin and English. In neither of these, in our opinion, has he added anything to his *Apology*, which, as we have already said, contains the sum of all that he has written or published.

In the latter part of his life, Barclay obtained, by the influence of his talents and the sincerity and simplicity of his character and professions, an exemption from that persecution which marked his early years. He had also contributed in no small degree, by the eloquence of his writings in defence of the Friends, to procure for them a considerable share of public respect. He is even found, strangely enough, to have latterly possessed some influence at the dissolute court of Charles II. In 1679 he obtained a charter from this monarch, under the great seal,

erecting his lands of Ury,¹ into a free barony, with civil and criminal jurisdiction to him and his heirs. This charter was afterwards ratified by an act of parliament, the preamble of which states it to be "for the many services done by Colonel David Barclay, and his son the said Robert Barclay, to the king and his most royal progenitors in times past." Another and more distinguished mark of court favour was conferred upon him in 1682, when he received the nominal appointment of governor of East Jersey, in North America, from the proprietors of that province, of whom his friend the Earl of Perth was one. He was also himself made a proprietor, and had allotted to him 5000 acres of land above his proprietary share, as inducements for his acceptance of the dignity, which, at the same time, he was permitted to depute. The royal commission confirming this grant states, that such are his known fidelity and capacity, that he has the government during life, but that no other governor after him shall have it for more than three years. One of his brothers settled in the province, but he never visited it himself. In this year we find him assisting the Laird of Swinton with his interest and purse at Edinburgh; thus answering practically and freely the apostolic exhortation (1 Cor. ix. 11), by permitting Swinton to reap carnal things, who had sown spiritual things to his family.

The remainder of his life is not marked with many instances of public action. Much of it appears to have been passed in tranquillity, and in the bosom of his family; yet he occasionally undertook journeys to promote his private concerns, to serve his relations and neighbours, or to maintain the cause of his brethren in religious profession. He was in London in 1685, and had frequent access to King James II., who had all along evinced a warm friendship towards him. Barclay, on the other hand, thinking James sincere in his faith, and perhaps influenced a little by the flattery of a prince's favour, appears to have conceived a real regard for this misguided and imprudent monarch. Liberty of conscience having been conceded to the Friends on the accession of James II., Barclay exerted his influence to procure some parliamentary arrangement, by which they might be exempted from the harsh and ruinous prosecutions to which they were exposed, in consequence of their peculiar notions as to the exercise of the law. He was again in London on this business in 1686, on which occasion he visited the seven bishops then confined in the Tower for having refused to distribute in their respective dioceses the king's declaration for liberty of conscience, and for having represented to the king the grounds of their objection to the measure. The popular opinion was in favour of the bishops; yet the former severities of some of the episcopal order against dissenters, particularly against the Friends, occasioned some reflections on them. This having come to the knowledge of the imprisoned bishops, they declared that "the Quakers had belied them, by reporting that they had been the death of some." Robert Barclay, being informed of this declaration, went to the Tower, and gave their lordships a well-substantiated account of some persons having been detained in prison till death by order of bishops, though they had been apprised of the danger by physicians who were not Quakers. He, however, observed to the bishops, that it was by no means the intention of the Friends to publish such events, and thereby give the king and their other adversaries any ad-

¹ His father had died in 1676, leaving him in possession of this estate.

vantage against them. Barclay was in London, for the last time, in the memorable year 1688. He visited James II., and being with him near a window, the king looked out, and observed that "the wind was then fair for the Prince of Orange to come over." Robert Barclay replied, "it was hard that no expedient could be found to satisfy the people." The king declared "he would do anything becoming a gentleman, except parting with liberty of conscience, which he never would whilst he lived." Barclay took a final leave of the unfortunate king, for whose disasters he was much concerned, and with whom he had been several times engaged in serious discourse.

Robert Barclay "laid down the body," says Andrew Jaffray, "in the holy and honourable truth, wherein he had served it about three and twenty years, upon the 3d day of the eighth month, 1690, near the forty and second year of his age, at his own house of Urie, in Scotland, and it was laid in his own burial ground there, upon the 6th day of the same month, before many friends and other people." His character has been thus drawn by another of the amicable fraternity to which he belonged:—

"He was distinguished by strong mental powers, particularly by great penetration, and a sound and accurate judgment. His talents were much improved by a regular and classical education. It does not, however, appear that his superior qualifications produced that elation of mind which is too often their attendant: he was meek, humble, and ready to allow to others the merit they possessed. All his passions were under the most excellent government. Two of his intimate friends, in their character of him, declare that they never knew him to be angry. He had the happiness of early perceiving the infinite superiority of religion to every other attainment; and the Divine grace enabled him to dedicate his life, and all that he possessed, to promote the cause of piety and virtue. For the welfare of his friends he was sincerely and warmly concerned: and he travelled and wrote much, as well as suffered cheerfully, in support of the society and the principles to which he had conscientiously attached himself. But this was not a blind and bigoted attachment. His zeal was tempered with charity; and he loved and respected goodness wherever he found it. His uncorrupted integrity and liberality of sentiment, his great abilities and suavity of disposition, gave him much interest with persons of rank and influence, and he employed it in a manner that marked the benevolence of his heart. He loved peace, and was often instrumental in settling disputes, and in producing reconciliations between contending parties. . . . In private life he was equally amiable. His conversation was cheerful, guarded, and instructive. He was a dutiful son, an affectionate and faithful husband, a tender and careful father, a kind and considerate master. Without exaggeration, it may be said, that piety and virtue were recommended by his example; and that, though the period of his life was short, he had, by the aid of divine grace, most wisely and happily improved it. He lived long enough to manifest, in an eminent degree, the temper and conduct of a Christian, and the virtues and qualifications of a true minister of the gospel."

BARCLAY, WILLIAM, an eminent civilian, and father of the still more celebrated author of the *Argenis*, was descended from one of the best families in Scotland under the rank of nobility, and was

born in Aberdeenshire, in 1541. He spent his early years in the court of Queen Mary, with whom he was in high favour. After her captivity in England, disgusted with the turbulent state of his native country, which promised no advantage to a man of learning, he removed to France (1573), and began to study the law at Bourges. Having in time qualified himself to teach the civil law, he was appointed by the Duke of Lorraine, through the recommendation of his kinsman Edmund Hay, the Jesuit, to be a professor of that science in the university of Pontamousson, being at the same time counsellor of state and master of requests to his princely patron. In 1581 he married Anne de Maleville, a young lady of Lorraine, by whom he had his son John, the subject of a preceding article. This youth showed tokens of genius at an early period, and was sought from his father by the Jesuits, that he might enter their society. The father, thinking proper to refuse the request, became an object of such wrath to that learned and unscrupulous fraternity, that he was compelled to abandon all his preferments, and seek refuge in England. This was in 1603, just at the time when his native sovereign had acceded to the throne of England. James I. offered him a pension, and a place in his councils, on condition that he would embrace the Protestant faith; but though indignant at the intrigues of the Jesuits, he would not desert their religion. In 1604 he returned to France, and became professor of civil law at Angers, where he taught for a considerable time with high reputation. It is said that he entertained a very high sense of the dignity of his office. He used to "go to school every day, attended by a servant who went before him, himself having a rich robe lined with ermine, the train of which was supported by two servants, and his son upon his right hand; and there hung about his neck a great chain of gold, with a medal of gold with his own picture." Such was, in those days, the pomp and circumstance of the profession of civil law. He did not long enjoy this situation, dying towards the close of 1605. He is allowed to have been very learned, not only in the civil and canon law, but in the classical languages, and in ecclesiastical history. But his prejudices were of so violent a nature as to obscure both his genius and erudition. He zealously maintained the absolute power of monarchs, and had an illiberal antipathy to the Protestant religion. His works are: 1. *A Controversial Treatise on the Royal Power, against Buchanan and other King-killers*, Paris, 1600; 2. *A Treatise on the Power of the Pope, showing that he has no Right of Rule over Secular Princes*, 1609; 3. *A Commentary on the Title of the Pandects de Rebus Creditis*, &c.; 4. *A Commentary on Tacitus' Life of Agricola*. All these works, as well as their titles, are in Latin.

BARNARD, LADY ANNE. This lady, who by a single song has immortalized her name, was the eldest daughter of the fifth Earl of Balcarres. She was born on the 8th of December, 1750, and under circumstances that were grievously subversive of a cherished prediction. "There had long existed a prophecy that the first child of the last descendant of the house of Balcarres was to restore the family of Stuart to those hereditary rights which the bigotry of James had deprived them of. The Jacobites seemed to have gained new life on the occasion; the wizards and witches of the party had found it in their books; the devil had mentioned it to one or two of his particular friends; old ladies had read it from the grounds of their coffee,—no wonder if the event was welcomed by the grasp of expiring hope. . . .

¹ *A Short Account of the Life and Writings of Robert Barclay*, London, 1802.

In due course of time the partizans of the Pretender, the soothsayers, wizards, witches, the bards, fortune-tellers, and old ladies, were all in a group, amazed, disconcerted, and enraged to learn that Lady Balcarres was brought to bed of a daughter after all,—absolutely but a daughter." Such is her own amusing account of the circumstances under which she was ushered into the world. "That child," she adds, "was the Anne Lindsay who now addresses you, and in the arms of my nurse I promised to be a little heiress, perhaps a heroine worthy of having my name posted on the front of a novel."

After an account of her infancy and youth written in the same lively style, Lady Anne Lindsay (for this was her maiden name) gives an account of the education by which her mind was formed. Not the least of her intellectual advantages was the society with which she was brought in contact, in her occasional visits to Edinburgh; and among the distinguished of the day whom she met in that city, may be mentioned, Henry Mackenzie, author of *The Man of Feeling*, Lord Monboddo, and in 1773 Dr. Johnson, when he visited the northern metropolis. One part of her self-education at her country-house in Fifeshire is too interesting to be omitted:—"Residing," she says, "in the solitude of the country, without other sources of entertainment than what I could draw from myself, I used to mount up to my little closet in the high winding staircase, which commanded the sea, the lake, the rock, the birds, the beach,—and, with my pen in my hand, and a few envelopes of old letters (which too often vanished afterwards), scribble away poetically and in prose, till I made myself an artificial happiness, which did very well *pour passer le temps*, though far better would my attempts have been had I had Margaret's judgment to correct them."

The fruits of such training was the song of *Auld Robin Gray*, which Lady Anne wrote in the beginning of 1772, when she was twenty-one years old. As every circumstance connected with such a matchless lyric is interesting, and as no account can be more interesting than that of the authoress, we give it in her own words:—"Robin Gray, so called from its being the name of the old herdsman at Balcarres, was born soon after the close of 1771. My sister Margaret had married, and accompanied her husband to London; I was melancholy, and endeavoured to amuse myself by attempting a few poetical trifles. There was an ancient Scotch melody of which I was passionately fond,—Sophy Johnston, who lived before your day, used to sing it to us at Balcarres; I longed to sing old Sophy's air to different words, and to give to its plaintive tones some little history of virtuous distress in humble life, such as might suit it. While attempting to effect this in my closet, I called to my little sister, now Lady Hardwicke, who was the only person near me—"I have been writing a ballad, my dear; I am oppressing my heroine with many misfortunes: I have already sent her Jamie to sea, and broken her father's arm, and made her mother fall sick, and given her auld Robin Gray for a lover, but I wish to load her with a fifth sorrow in the four lines, poor thing! help me to one, I pray."—"Steal the cow, sister Anne," said the little Elizabeth. The cow was immediately *lifted* by me, and the song completed. At our fireside, amongst our neighbours, *Auld Robin Gray* was always called for; I was pleased with the approbation it met with, but such was my dread of being suspected of writing anything, perceiving the shyness it created in those who could write nothing, that I carefully kept my own secret. . . . Meantime, little as this matter seems to have been worthy of dispute, it afterwards

became almost a party question between the sixteenth and eighteenth centuries: *Robin Gray* was either a very, very ancient ballad, composed perhaps by David Rizzio, and a great curiosity; or a very, very modern matter, and no curiosity at all. I was persecuted to confess whether I had written it, or if not, where I had got it. Old Sophy kept my counsel, and I kept my own, in spite of the gratification of seeing a reward of twenty guineas offered in the newspapers to the person who should ascertain the point past a doubt, and the still more flattering circumstance of a visit from Mr. J——, secretary to the Antiquarian Society, who endeavoured to entrap the truth from me in a manner I took amiss. Had he asked me the question obligingly, I should have told him the fact distinctly, but confidentially; the annoyance, however, of this important ambassador from the antiquaries was amply repaid to me by the noble exhibition of the ballet of *Auld Robin Gray's Courtship*, as performed by dancing dogs under my windows:—it proved its popularity from the highest to the lowest, and gave me pleasure while I hugged myself in my obscurity." In the reticence of Lady Anne, that could keep the fact of her authorship concealed after her ballad had become the admired of all classes, and been translated into almost every European language, there was a power of secretiveness more remarkable than the talent by which such beautiful verses were created. It was only in 1823, fifty-two years after the song had been composed, that she broke silence, and confessed herself the author of the song. The occasion also was worthy of the acknowledgment. In that year, when the tale of the *Pirate* appeared, the author of *Waverley* compared the condition of Minna to that of Jeannie Gray, "the village-heroine in Lady Anne Lindsay's beautiful ballad:"—

"Nae langer she wept, her tears were a' spent,
Despair it was come, and she thought it content;
She thought it content—but her cheek it grew pale,
And she drooped like a snow-drop broke down by the hail."

This detection by the highest literary authority of the day, convinced Lady Anne that concealment was no longer possible; and in a letter to Sir Walter she wrote the confession from which we have quoted.

It was not until many years after *Auld Robin Gray* was written, that a second part was added to it. It was produced also to gratify the wishes of her mother the Countess of Balcarres, who had often said to her, "Annie, I wish you would tell me how that unlucky business of Jeanie and Jamie ended." Lady Anne had also got a hint for the development of the plot, of which she now availed herself. On hearing the song as it first appeared, the laird of Dalzell burst out wrathfully with, "Oh the villain! oh the auld rascal! I ken wha steal the poor lassie's cow—it was Auld Robin Gray himself!" In the second part therefore, "Auld Rob" is seized with remorse at the sight of his broken-hearted wife's repining; takes to his bed, and after confessing that he had stolen the cow for the purpose of furthering his suit, he dies, leaving Jamie his sole heir, and recommending that the pair should be married—an advice which they are not slow to follow. But like all such additions, the second part was a failure. The sequel was an abrupt intrusion upon the pleasing poetical sadness in which the first part left the hearers, and they were in no mood to be defrauded of such a sentimental luxury. The voice of the singer and the feelings of the audience were too much touched by the first part, to endure the details of the second.

Her sister Margaret, who had married very early and become a widow, was joined in London by Lady

Anne. The beauty and accomplishments of the two ladies procured them a choice society and many admirers, and the hand of Anne was sought in marriage by several men of the first distinction in the country. The house of the attractive sisters in London is described by Lord Balcarras, their brother, as having become "the meeting-place of great and good characters, literary and political;" and the most distinguished of these, Burke, Sheridan, Windham, and Dundas, confirm the assertion. The Prince of Wales was also their familiar guest and friend, and his attachment to Lady Anne ended only with his life. She remained single until 1793, when she gave her hand to Andrew Barnard, Esq., the son of the Bishop of Limerick, an accomplished but not wealthy gentleman, and younger than herself, whom she accompanied to the Cape of Good Hope, in consequence of his appointment as colonial secretary under Lord Macartney. The journals of her residence at the Cape, and of her excursions into the interior of the country, illustrated with drawings and sketches of the scenes described, are still preserved among the family manuscripts. When in South Africa, she had always a strong wish to visit Australia, then only known as "Botany Bay," "not," she humorously adds, "from a longing to commit a crime, but from a desire to rejoice with the angels over repenting sinners. If one reformed rogue gives to beatified spirits as much joy as the good conduct of ninety-nine righteous persons, what a feeling must be created by such a group!" Like other amiable enthusiasts of the period, she thought that Botany Bay was a blessed reformatory, instead of the wholesale Newgate which it in reality was. "But it would appear," she adds, "so strange a measure to go there from choice, that I believe it would be necessary to commit some peccadillo as an apology to my relations for going at all." Her desire for this trip would probably have been fulfilled, as her husband shared in the wish, and intended on his return to England to have taken her home by that very circuitous route; but the peace of 1802 compelled Mr. Barnard to remain behind at the Cape, to settle colonial business with the Dutch, while Lady Anne went to England to procure a situation for her husband under government, on his return—an application, however, which was unsuccessful.

By the death of Mr. Barnard at the Cape in 1807, Lady Anne was left a childless widow, and she again took up her residence with her sister Margaret, in Berkeley Square, London, until the latter was married for the second time in 1812 to Sir James Burgess. After this period she continued her honoured course in London, beloved by its choicest society, and maintaining at the age of threescore and ten, and even beyond it, that cheerfulness and conversational power which had made her through her whole life the charm of her numerous acquaintances. An amusing proof of this one day occurred when she was entertaining a party of her friends at dinner. Some difficulty had occurred in the kitchen arrangements, on which account an old servant, who knew the inexhaustible mental resources of her mistress, glided to her behind her chair, and whispered in her ear, "My lady, you must tell another story—the second course won't be ready for five minutes." Of the strong and abiding friendships she created in the hearts of others, a proof was given in that of the Prince of Wales (afterwards George IV.), who, on the death of her husband, wrote to her a letter of sympathy, of itself sufficient to redeem his character from the prevailing charge of selfishness. In his last illness he also sent for her, and after speaking to her affectionately, he said, "Sister Anne (the title with

which he usually addressed her), I wished to see you, to tell you that I love you, and wish you to accept this golden chain for my sake—I may never see you again." The chief literary occupation of her old age was in writing reminiscences of the Lindsays, to add to the family history—a task which her father, Earl James, had commenced, and which he wished his children to continue. "It was a maxim of my father's," she said, "that the person who neglects to leave some trace of his mind behind him, according to his capacity, fails not only in his duty to society, but in gratitude to the Author of his being, and may be said to have existed in vain. 'Every man,' said he, 'has felt or thought, invented or observed; a little of that genius which we receive from nature, or a little of that experience which we buy in our walk through life, if bequeathed to the community, would ultimately become a collection to do honour to the family where such records were preserved.'" Hence the large and valuable additions which she made to the *Lives of the Lindsays*, and the copious reminiscences of a long life which constitute the principal charm of that interesting work. Although she must have written much poetry as well as prose, her characteristic shyness where her verses were in question have made her productions of this kind unknown—with the exception of *Auld Robin Gray*, which of itself is sufficient to establish her lasting fame as a poetess. Lady Anne Barnard died on May 6th, 1825, in the seventy-fourth year of her age.

BARTON, ANDREW, High Admiral of Scotland. The fifteenth century was the great era of maritime adventure and discovery; and in these it might have been expected that Scotland would have taken her full share. The troubled state of the country, however, and the poverty of its sovereigns, prevented the realization of such a hope. There was no royal navy, and such ships as were to be found in the Scottish service were merchant vessels, and the property of private individuals. Still, there was no lack of stout hardy sailors and skilful commanders; and although the poverty of Scotland was unable to furnish means for remote and uncertain voyages of discovery, the same cause made them eager to enjoy the advantages of traffic with those countries that were already known. Another cause was the long peace with England during the reign of Henry VII., so that those daring spirits who could no longer find occupation in fight or foray by land, were fain to have recourse to the dangers of another element. The merchant, also, who embarked with his own cargo, was obliged to know something more than the gainful craft of a mere trader. He was captain as well as proprietor, and had to add the science of navigation and the art of warfare on sea, to that of skilful bargaining on shore, and thus, in every variety of ways, his intellectual powers were tried and perfected. This was an occupation well fitted to the Scottish mind, in which it consequently became so pre-eminent, that during the reigns of James III. and James IV., it seemed a doubtful question whether Scotland or England was to bear the "meteor flag" of the island; and of the merchant captains of this period, the most distinguished were Sir Andrew Wood, of Largo; Sir Alexander Mathieson; William Merrimonth, of Leith, who, for his naval skill, was called the "king of the sea;" and the Bartons.

This Barton family, which for two generations produced naval commanders of great celebrity, first appeared in Scottish history in 1476. This was in consequence of John Barton, the father of Andrew, having been plundered, and, it has been added,

murdered, by the Portuguese, who at that period were all-prevalent upon the ocean. The unfortunate mariner, however, had three sons, the eldest of whom was Andrew, all brought up from boyhood in his own profession, and not likely to allow their father's death to pass unquestioned. Andrew accordingly instituted a trial in Flanders, where the murder was perpetrated, and obtained a verdict in his favour; but the Portuguese refusing to pay the awarded penalty, the Bartons applied to their own sovereign for redress. James accordingly sent a herald to the King of Portugal; but this application having also been in vain, he granted to the Bartons letters of reprisal, by which they were allowed to indemnify themselves by the strong hand upon the ships of the Portuguese. And such a commission was not allowed to lie idle. The Bartons immediately threw themselves into the track of the richly-laden carracks and argosies of Portugal in their homeward way from India and South America; and such was their success, that they not only soon indemnified themselves for their losses, but won a high reputation for naval skill and valour. Among the rich Indian spoil that was brought home on this occasion, were several Hindoo and negro captives, whose ebony colour and strange features astounded, and also alarmed, the simple people of Scotland. James IV. turned these singular visitants to account, by making them play the part of Ethiopian queens and African sorcerers in the masques and pageants of his court. This was in itself a trifle, but it gave a high idea of the growing naval importance of Scotland, when it could produce such spectacles as even England, with all its superior wealth, power, and refinement, was unable to furnish.

It was not merely in such expeditions which had personal profit or revenge for their object that the Bartons were exclusively employed; for they were in the service of a master (James IV.) who was an enthusiast in naval affairs, and who more than all his predecessors understood the necessity of a fleet as the right arm of a British sovereign. This was especially the case in his attempts to subjugate the Scottish isles, that for centuries had persisted in rebellion under independent kinglings of their own, and in every national difficulty had been wont to invade the mainland, and sweep the adjacent districts with fire and sword. For the purpose of reducing them to complete obedience, James not only led against them an army in person, but employed John Barton, one of the three brothers, to conduct a fleet, and invade them by sea. The use of ships in such a kind of warfare was soon apparent: the islanders retreated from the royal army, as heretofore, in their galleys, and took refuge among their iron-bound coasts, but found these no longer places of safety when their fastnesses were assailed from the sea, and their strong castles bombarded. The chiefs, therefore, yielded themselves to the royal authority, and from thenceforth lived in most unwonted submission. While thus the Scottish flag waved over those islands that had hitherto been the strongholds of rebellion, another of the Bartons was employed to vindicate its dignity abroad and among foreigners. This was Andrew, who for some time had held with his brothers the chief direction of maritime affairs in Scotland, and been employed in the formation of a royal navy, as well as in cruises against the rich carracks of Portugal. The Hollanders, in the true spirit of piracy by which the maritime communities of Europe were at this time inspired, had attacked a small fleet of Scottish merchant vessels, and not only plundered them, but murdered the crews, and thrown their bodies into the sea. This outrage, from

a people with whom the Scots were at peace, was not to be tolerated, and Andrew Barton was sent with a squadron to chastise the offenders. And this he did with a merciless severity that reminds us of the "Douglas Larder." He captured many of the piratical ships, and not only put their crews to death, but barrelled their heads in the empty casks which he found in the vessels, and sent them home to his sovereign, to prove how well he had discharged his duty.

The time had now arrived, however, when Andrew Barton, after having made so many successful cruises, was to fall upon the deck where he had so often stood a conqueror. His death, also, strangely enough, was mainly owing to the tortuous intrigues of a pontiff, about whom, it is probable, he had heard little, and cared still less. Julius II. having formed designs of political self-aggrandizement which a war between France and England would have prevented, was anxious to find the latter sufficient occupation at home, with its turbulent neighbours, the Scots. Portuguese envoys, therefore, at the English court represented to Henry VIII. the whole family of the Bartons as pirates, who indiscriminately plundered the ships of every country; and they charged Andrew, in particular, with these offences, and represented how desirable it would be if the English seas could be rid of his presence. Henry listened to these suggestions, and, with his wonted impetuosity, assented to their fulfilment, although a war with Scotland was at that time the least desirable event that could have befallen him. It has also been alleged by English writers, that Andrew Barton, in his war against the Portuguese, had not been over-scrupulous in confining himself to his letters of reprisal, but had also over-hauled and pillaged English vessels, under the pretext that they had Portuguese goods on board. Such, at least, was generally believed in England; and the Earl of Surrey, to whom the naval affairs of the kingdom chiefly belonged, is declared to have sworn that the narrow seas should no longer be thus infested, while his estate could furnish a ship or his family a son to command it.

The threat of Surrey was not an idle one. He fitted out two men-of-war, one of them the largest in the English navy, and sent them under the command of his sons, Lord Thomas Howard, and Sir Edward Howard, afterwards lord high-admiral, to find and encounter the terrible Scottish seaman. They had not long to seek, for in the Downs they were apprized of his neighbourhood by the captain of a merchant vessel which he had plundered on the preceding day. Barton had just returned from a cruise against the Portuguese, with two ships, one the *Lion*, which himself commanded, and the other a small armed pinnace. When the Howards approached, they hoisted no war signal, but merely put up a willow-wand on their masts, as if they were peaceful traders; but when Andrew Barton approached, they hoisted their national flag, and fired a broadside into his vessel. On finding that he had enemies to deal with, although they were of superior force, he fearlessly advanced to the encounter. Distinguished by his rich dress, his splendid armour of proof, and the gold chain around his neck, to which was attached a whistle of the same metal, the emblem of his office as high admiral of Scotland, he took his stand upon the highest part of the deck, and encouraged his men to fight bravely. The battle commenced, and continued on both sides with the utmost desperation. One manoeuvre of Scottish naval warfare which Barton used, was derived from an old Roman practice used against

the Carthaginians, although he had, perhaps, never read their history; this was, to drop large weights or beams from the yard-arms of his vessel into that of the enemy, and thus sink it while the two ships were locked together; but, to accomplish this feat, it was necessary for a man to go aloft to let the weight fall. The English commander, apprised of this, had appointed the best archer of his crew to keep watch upon the movement, and shoot every man who attempted to go aloft for the purpose. The archer had already brought down two Scottish seamen who had successively ventured to ascend, when Andrew Barton, seeing the danger, resolved to make the attempt himself. As he ascended the mast for this purpose, Lord Howard cried to his archer, "Shoot, villain, and shoot true, on peril of thy life." "An' I were to die for it," replied the man despondingly, "I have but two arrows left." These, however, he used with his utmost strength and skill. The first shaft bounded from Barton's coat of proof, but the second entered the crevice of his armour, as he stretched up his hand in the act of climbing the mast, and inflicted a mortal wound through the arm-pit. He descended as if unhurt, and exclaimed, "Fight on, my merry men; I am but slightly wounded, and will rest me awhile, but will soon join you again; in the meantime, stand you fast by the cross of Saint Andrew!" He then blew his whistle during the combat, to encourage his followers, and continued to sound it as long as life remained. After his death the conflict terminated in the capture of the *Lion*, and also the pinnace, called the *Jenny Pirteen*, which were brought in triumph into the Thames. The *Lion* was afterwards adopted into the English navy, and was the second largest ship in the service, the *Great Henry*, the first vessel which the English had expressly constructed for war, being the largest.

Such was the end of Andrew Barton, a bright name in the early naval history of Scotland. While his death was felt as a great national calamity, it was particularly affecting to James IV., whose nautical studies he had directed, and whose infant navy he had made so distinguished among the European maritime powers. Rothesay herald was instantly despatched to London, to complain of this breach of peace, and demand redress; but to this appeal Henry VIII. arrogantly replied, that Barton was a pirate, and that the fate of pirates ought never to be a subject of contention between princes. Here, however, the matter was not to rest. Robert Barton, one of Andrew's brothers, was immediately furnished with letters of reprisal against the English; and thus commissioned, he swept the narrow seas so effectually, that he soon returned to Leith with thirteen English prizes. War by sea between England and Scotland was soon followed by war by land, and in the letter of remonstrance and defiance to Henry VIII., with which James preceded the invasion of England, the unjust slaughter of Andrew Barton, and the capture of his ships, were stated among the principal grievances for which redress was thus sought. Even when battle was at hand, also, Lord Thomas Howard sent a message to the Scottish king, boasting of his share in the death of Barton, whom he persisted in calling a pirate, and adding, that he was ready to justify the deed in the vanguard, where his command lay, and where he meant to show as little mercy as he expected to receive. And then succeeded the battle of Flodden, in which James and the best of the Scottish nobility fell; and after Flodden, a loss occurred which Barton would rather have died than witnessed. This was the utter extinction of the Scottish fleet, which was

allowed to lie rotting in the harbours of France, or to be trucked away in inglorious sale, like common firewood. From that period, Scotland so completely ceased to be a naval power, that even at the time of the union she not only had no war vessels whatever, but scarcely any merchant ships—the few that lay in her ports being chiefly the property of the traders of Holland;—and full three centuries have to elapse before we find another distinguished Scottish seaman in the naval history of Great Britain.

BASSANTIN, OR BASSANTOUN, JAMES, astronomer and mathematician, was the son of the laird of Bassantin, in Berwickshire, and probably born in the early part of the sixteenth century. Being sent to study at the university of Glasgow, he applied himself almost exclusively to mathematics, to the neglect of languages and philosophy, which were then the most common study. In order to prosecute mathematics more effectually than it was possible to do in his own country, he went abroad, and travelled through the Netherlands, Switzerland, Italy, and Germany; fixing himself at last in France, where for a considerable time he taught his favourite science with high reputation in the university of Paris. In that age, the study of astronomy was inseparable from astrology, and Bassantin became a celebrated proficient in this pretended science, which was then highly cultivated in France, inasmuch that it entered more or less into almost all public affairs, and nearly every court in Europe had its astrologer. Bassantin, besides his attainments in astrology, understood the laws of the heavens to an extent which excited the wonder of the age—especially when it was considered that he had scarcely any knowledge of the Greek or Latin languages, in which all that was formerly known of this science had been embodied. But, as may be easily conceived, astronomy was as yet a most imperfect science; the Copernican system, which forms the groundwork of modern astronomy, was not yet discovered or acknowledged; and all that was really known had in time become so inextricably associated with the dreams of astrology, as to be entitled to little respect. Bassantin returned to his native country in 1562, and in passing through England met with Sir Robert Melville of Mordecairny, who was then engaged in a diplomatic mission from Mary to Elizabeth, for the purpose of bringing about a meeting between the two queens. A curious account of this rencontre is preserved by Sir James Melville in his memoirs, and, as it is highly illustrative of the character and pretensions of Bassantin, we shall lay it before the reader. "Ane Bassantin, a Scottis man, that had been travellit, and was learnit in hich scyences, cam to him [Sir Robert Melville] and said, 'Gud gentilman, I hear sa gud report of you that I love you hartly, and therefore canot forbear to shaw you, how all your upright dealing and your honest travell will be in vain, where ye believe to obtain a weall for our quen at the Quen of Englandis handis. You bot tyne your tyme; for, first, they will never meet together, and next, there will never be bot dissembling and secret hattreit for a while, and at length captivity and utter wrak for our quen by England.' My brother's answer again was, that he lyked not to heir of sic devilsch newes, nor yet wald he credit them in any sort, as false, ungodly, and unlawfull for Christians to medle them with. Bassantin answered again, 'Gud Mester Melvill, tak not that hard opinion of me; I am a Christian of your religion, and fears God, and purposes never to cast myself in any of the unlawful artis that ye mean of, bot sa far as Melanthon, wha was a godly

theologue, has declared and written anent the naturall sciences, that are lawfull and daily red in dyvers Christian universities; in the quihikis, as in all othir artis, God geves to some less, to some mair and clearer knowledge than till others; be the quihik knowledge I have also that at length, that the kingdom of England sall of rycht fall to the crown of Scotland, and that ther are some born at this instant that sall bruik lands and heritages in England. Bot alace it will cost many their lyves, and many bludy batailles wilbe fouchten first, or [ere] it tak a sattled effect; and be my knowledge,' said he, 'the Spaniards will be helpers, and will tak a part to themselves for ther labours, quihik they wilbe laith to leve again.'" If the report of this conference be quite faithful, we must certainly do Bassantin the justice to say, that the most material part of his prophecy came to pass; though it might be easy for him to see that, as the sovereign of Scotland was heires-presumptive to the crown of England, she or her heirs had a near prospect of succeeding. How Bassantin spent his time in Scotland does not appear; but, as a good Protestant, he became a warm supporter of the Earl of Murray, then struggling for the ascendancy. He died in 1568. His works are—

1. *A System of Astronomy*, published for the third time in 1593, by John Tornæsius.
2. *A Treatise of the Astrolabe*, published at Lyons in 1555, and reprinted at Paris in 1617.
3. *A Pamphlet on the Calculation of Nativities*.
4. *A Treatise on Arithmetic*.
5. *Music on the Principles of the Platonists*.
6. *On Mathematics in General*. It is understood that, in the composition of these works, he required considerable literary assistance, being only skilled in his own language, which was never then made the vehicle of scientific discussion.

BASSOL, JOHN, a distinguished disciple of the famous Duns Scotus, is stated by Mackenzie to have been born in the reign of Alexander III. He studied under Duns at Oxford, and with him, in 1304, removed to Paris, where he resided some time in the university, and in 1313 entered the order of the Minorites. After this he was sent by the general of his order to Rheims, where he applied himself to the study of medicine, and taught philosophy for seven or eight years. In 1322 he removed to Mechlin in Brabant, and after teaching theology in that city for five and twenty years, died in 1347.

Bassol's only work was one entitled *Commentaria seu Lecture in Quatuor Libros Sententiarum*, to which were attached some miscellaneous papers on philosophy and medicine. The book was published in folio at Paris, in 1517. Bassol was known by the title *Doctor Ordinatusimus*, or the Most Methodical Doctor, on account of the clear and accurate method in which he lectured and composed. The fashion of giving such titles to the great masters of the schools was then in its prime. Thus, Duns Scotus himself was styled *Doctor Subtilis*, or the Subtle Doctor. St. Francis of Assis was called the *Seraphic Doctor*; Alexander Hales, the *Irrefragable Doctor*; Thomas Aquinas, the *Angelic Doctor*; Hendricus Bonicollus, the *Solemn Doctor*; Richard Middleton, the *Solid Doctor*; Francis Mayron, the *Acute Doctor*; Durandus à S. Portiano, the *Most Resolute Doctor*; Thomas Bredwardin, the *Profund Doctor*; Joannes Ruysbrokins, the *Divine Doctor*, and so forth; the title being in every case founded upon some extravagant conception of the merit of the particular individual, adopted by his contemporaries and disciples. In this extraordinary class of literati John Bassol, as implied by his *soubriquet*, shines conspicuous for order and method; yet we are told that his works

contain most of the faults which are generally laid to the charge of the schoolmen. The chief of these is an irrational devotion to the philosophy of Aristotle, as expounded by Thomas Aquinas. In the early ages of modern philosophy, this most splendid exertion of the human mind was believed to be irreconcilable with the Christian doctrines; and at the very time when the Angelical Doctor wrote his commentary, it stood prohibited by a decree of Pope Gregory IX. The illustrious Thomas not only restored Aristotle to favour, but inspired his followers with an admiration of his precepts, which, as already mentioned, was not rational. Not less was their admiration of the "angelical" commentator, to whom it was long the fashion among them to offer an incense little short of blasphemy. A commentator upon an original work of Thomas Aquinas endeavours, in a prefatory discourse, to prove, in so many chapters, that he wrote his books not without the special infusion of the Spirit of God Almighty; that, in writing them, he received many things by revelation; and that Christ had given anticipatory testimony to his writings. By way of bringing the works of St. Thomas into direct comparison with the Holy Scriptures, the same writer remarks, "that, as in the first general councils of the church, it was common to have the Bible unfolded upon the altar, so, in the last general council (that of Trent), St. Thomas' *Sum* was placed beside the Bible, as an inferior rule of Christian doctrine." Peter Labbé, a learned Jesuit, with scarcely less daring flattery, styles St. Thomas an angel, and says that, as he learned many things from the angels, so he taught the angels some things; that St. Thomas had said what St. Paul was not permitted to utter; and that he speaks of God as if he had seen him, and of Christ as if he had been his voice. One might almost suppose that these learned gentlemen, disregarding the sentiment afterwards embodied by Gray, that flattery soothes not the cold ear of death, endeavoured by their praises to make interest with the "angelical" shade, not doubting that he was able to obtain for them a larger share of paradise than they could otherwise hope for. In the words of the author of the *Reflections on Learning*, "the sainted Thomas, if capable of hearing these inordinate flatteries, must have blushed to receive them."

Bassol was also characterized, in common with all the rest of the schoolmen, by a ridiculous nicety in starting questions and objections. Overlooking the great moral aim of what they were expounding, he and his fellows lost themselves in minute and subtle inquiries after physical exactness, started at every straw which lay upon their path, and measured the powers of the mind by grains and scruples. It must be acknowledged, in favour of this singular class of men, that they improved natural reason to a great height, and that much of what is most admired in modern philosophy is only borrowed from them. At the same time, their curiosity in raising and prosecuting frivolous objections to the Christian system is to be regretted as the source of much scepticism and irreligion. To many of their arguments, ridicule only is due; and it would perhaps be impossible for the gravest to restrain a smile at the illustissimo mentioned by Cardan, one of whose arguments was declared to be enough to puzzle all posterity, and who himself wept in his old age because he had become unable to understand his own books.

The works of Bassol have been long forgotten, like those of his brethren; but it is not too much to say regarding this great man of a former day, that the same powers of mind which he spent upon the endless intricacies of the school philosophy, would

certainly, in another age and sphere, have tended to the permanent advantage of his fellow-creatures. He was so much admired by his illustrious preceptor, that that great man used to say, "If only Joannes Bassioliis be present, I have a sufficient auditory."

BAXTER, ANDREW, an ingenious moral and natural philosopher, was the son of a merchant in Old Aberdeen, and of Mrs. Elizabeth Fraser, a lady connected with some of the considerable families of that name in the north of Scotland. He was born at Old Aberdeen, in 1686 or 1687, and educated at the King's College, in his native city. His employment in early life was that of a preceptor to young gentlemen; and among others of his pupils were Lord Gray, Lord Blantyre, and Mr. Hay of Drummelzier. In 1723, while resident at Dunse Castle, as preceptor to the last-mentioned gentleman, he is known, from letters which passed between him and Henry Home, afterwards Lord Kaimes, to have been deeply engaged in both physical and metaphysical disquisitions. As Mr. Home's paternal seat of Kaimes was situated within a few miles of Dunse Castle, the similarity of their pursuits appears to have brought them into an intimate friendship and correspondence. This, however, was soon afterwards broken off. Mr. Home, who was a mere novice in physics, contended with Mr. Baxter that motion was necessarily the result of a succession of causes. The latter endeavoured, at first with much patience and good temper, to point out the error of this argument; but, teased at length with what he conceived to be sophistry purposely employed by his antagonist to show his ingenuity in throwing doubts on principles to which he himself annexed the greatest importance, and on which he had founded what he believed to be a demonstration of those doctrines most material to the happiness of mankind, he finally interrupted the correspondence, saying, "I shall return you all your letters; mine, if not already destroyed, you may likewise return; we shall burn them and our philosophical heats together."

About this time, Mr. Baxter married Alice Mabane, daughter of a respectable clergyman in Berwickshire. A few years afterwards he published his great work, entitled *An Inquiry into the Nature of the Human Soul, wherein its Immateriality is evinced from the Principles of Reason and Philosophy*. This work was originally without date; but a second edition appeared in 1737, and a third in 1745. It has been characterized in the highest terms of panegyric by Bishop Warburton. "He who would see," says this eminent prelate, "the justest and precise notions of God and the soul, may read this book; one of the most finished of the kind, in my humble opinion, that the present times, greatly advanced in true philosophy, have produced." The object of the treatise is to prove the immateriality, and consequently the immortality, of the soul, from the acknowledged principle of the *vis inertia* of matter. His argument, according to the learned Lord Woodhouselee, is as follows: "There is a resistance to any change of its present state, either of rest or motion, essential to matter, which is inconsistent with its possessing any active power. Those, therefore, which have been called the natural powers of matter, as gravity, attraction, elasticity, repulsion, are not powers implanted in matter, or possible to be made inherent in it, but are impulses or forces impressed upon it *ab extra*. The consequence of the want of active power in matter is, that all those effects commonly ascribed to its active powers must be produced upon it by an immaterial being. Hence we discover the necessity for the agency of a constant and universal

Providence in the material world, who is God; and hence we must admit the necessity of an immaterial mover in all spontaneous motions, which is the *soul*; for that which can arbitrarily effect a change in the present state of matter, cannot be matter itself, which resists all change of its present state: and since this change is effected by willing, that thing which wills in us is not matter, but an immaterial substance. From these fundamental propositions, the author deduces, as consequences, the necessary immortality of the soul, as being a simple un compounded substance, and thence incapable of decay, and its capacity of existing, and being conscious, when separated from the body." In 1741, leaving his family in Berwick, he went abroad with his pupil Mr. Hay, and resided for several years at Utrecht. In the course of various excursions which he made through Holland, France, and Germany, he was generally well received by the literati. He returned to Scotland in 1747, and, till his death, in 1750, resided constantly at Whittingham, in East Lothian, a seat of his pupil Mr. Hay. His latter works were *Matho, sive Cosmotheoria puerilis, Dialogus*, a piece designed for the use of his pupil; and *An Appendix to his Inquiry into the Nature of the Human Soul*, wherein he endeavoured to remove some difficulties which had been started against his notions of the *vis inertia* of matter by Maclaurin, in his *Account of Sir Isaac Newton's Philosophical Discoveries*. In 1779 the Rev. Dr. Duncan of South Warnborough published *The Evidence of Reason in proof of the Immortality of the Soul, independent on the more abstruse inquiry into the nature of matter and spirit—collected from the MSS. of the late Mr. Baxter*.

The learning and abilities of Mr. Baxter are sufficiently displayed in his writings, which, however, were of more note in the literary world during his own time than now. He was very studious, and sometimes sat up whole nights reading and writing. His temper was cheerful; he was a friend to innocent merriment, and of a disposition truly benevolent. In conversation he was modest, and not apt to make much show of the extensive knowledge he possessed. In the discharge of the several social and relative duties of life, his conduct was exemplary. He had the most reverential sentiments of the Deity, of whose presence and immediate support he had always a strong impression upon his mind. He paid a strict attention to economy, though he dressed elegantly, and was not parsimonious in his other expenses. It is known also that there were several occasions on which he acted with remarkable disinterestedness; and so far was he from courting preferment, that he repeatedly declined offers of that kind that were made to him, on the condition of his taking orders in the Church of England. The French, German, and Dutch languages were spoken by him with much ease, and the Italian tolerably; and he read and wrote them all, together with the Spanish. His friends and correspondents were numerous and respectable; among them are particularly mentioned Mr. Pointz, preceptor to the Duke of Cumberland, and Bishop Warburton.

BAYNE, OR BAINE, JAMES, A.M., a divine of some note, was the son of the Rev. Mr. Bayne, minister of Bonhill in Dumbartonshire, and was born in 1710. His education, commenced at the parish school, was completed at the university of Glasgow, and in due time he became a licensed preacher of the Established Church of Scotland. In consequence of the respectability of his father, and his own talents as a preacher, he was presented by the Duke of Montrose to the church of Killearn,

the parish adjoining that in which his father had long ministered the gospel, and memorable as the birthplace of Buchanan. In this sequestered and tranquil scene he spent many years, which he often referred to in after-life as the happiest he had ever known. He here married Miss Potter, daughter of Dr. Michael Potter, professor of divinity in the Glasgow university, by whom he had a large family. His son, the Rev. James Bayne, was licensed in the Scottish Establishment, but afterwards received episcopal ordination, and died in the exercise of that profession of faith at Alloa.

The reputation of Mr. Bayne as a preacher soon travelled far beyond the rural scene to which his ministrations were confined. His people, in allusion to the musical sweetness of his voice, honoured him with the poetical epithet of "the swan of the west." He was appointed to a collegiate charge in the High Church of Paisley, where his partner in duty was the celebrated Mr. Wotherspoon, afterwards president of the Nassau Hall College, Princeton, New Jersey. The two colleagues, however, did not cooperate harmoniously, although both enjoyed a high degree of popularity. Mr. Bayne displayed great public spirit during his connection with the Established Church, defending her spiritual liberties and independence in the church courts, and offering a determined opposition to the policy of the moderate or ruling party. The deposition of Mr. Thomas Gillespie of Carnock, the founder of the Relief church, made a powerful impression on his mind, and undoubtedly had a strong influence in inducing him to resign his pastoral charge in Paisley. But the immediate cause of that resolution was a keen dispute which took place in the kirk-session of his parish, respecting the appointment of a session-clerk. The session contested the right of appointment with the town-council; the whole community took an interest in the dispute; and the case came at last to be litigated in the court of session, which decided in favour of the town-council. Unhappily, Mr. Bayne and his colleague took opposite sides in this petty contest, and a painful misunderstanding was produced betwixt them, followed by consequences probably affecting the future destinies of both. Mr. Bayne refers to these differences in his letter of resignation, addressed to the Presbytery, dated 10th February, 1766:—"They (the Presbytery) know not how far I am advanced in life, who see not that a house of worship, so very large as the High Church, and commonly so crowded too, must be very unequal to my strength; and this burden was made more heavy by denying me a session to assist me in the common concerns of the parish, which I certainly had a title to. But the load became quite intolerable, when, by a late unhappy process, the just and natural right of the common session was wrested from us, which drove away from acting in it twelve men of excellent character." Mr. Bayne joined the Relief church, then in its infancy, having, even whilst in the Establishment, held ministerial communion with Mr. Simpson, minister of Bellshill congregation, the first Relief church in the west of Scotland. In his letter of resignation already quoted, Mr. Bayne assured his former brethren that the change of his condition, and the charge he had accepted, would make no change in his creed, nor in his principles of Christian and ministerial communion—"Nay (he adds), none in my cordial regard to the constitution and interests of the Church of Scotland, which I solemnly engaged to support some more than thirty years ago, and hope to do so while I live. At the same time I abhor persecution in every form, and that abuse of church power of late, which to me appears incon-

sistent with humanity, with the civil interests of the nation, and destructive of the ends of our office as ministers of Christ." On the 24th December, Mr. Bayne accepted a call to become minister of the College Street Relief Church, Edinburgh, and his induction took place on the 13th February, 1766, three days after his resignation of his charge in Paisley. As his demission fell to be adjudicated upon by the General Assembly, in May of that year, his name remained for the present upon the roll of the Establishment, and so little did he yet consider himself separated from the communion of that church, that when the half-yearly sacrament of the Lord's supper came round in Edinburgh, soon after his settlement, after preaching in his own church in the forenoon, he went over in the afternoon, at the head of his congregation, to the New Greyfriars' Church, and joined in the ordinance with the congregation of the Rev. Dr. Erskine. At the Assembly in May, Mr. Bayne, in obedience to a citation, appeared at the bar, and was declared to be no longer a minister of the Church of Scotland, and all clergymen of that body were prohibited from holding ministerial communion with him. Mr. Bayne defended the course he had taken in a review of the proceedings of the Assembly, entitled *Memoirs of Modern Church Reformation, or the History of the General Assembly, 1766, and occasional reflections upon the proceedings of said Assembly; with a brief account and vindication of the Presbytery of Relief*, by James Bayne, A.M., minister of the gospel at Edinburgh. He denounces, with indignant severity, the injustice of his having been condemned by the Assembly without a libel, merely for having accepted a charge in another church, "in which (says he), I presumed, they could find nothing criminal; for often had ministers resigned their charge upon different accounts, and justifiable; nay, some have given it up for the more entertaining and elegant employ of the stage, who were not called in question or found delinquents." This was a palpable hit at Home, the author of *Douglas*, who sat in the Assembly as a ruling elder, to aid Dr. Robertson in punishing Bayne.

After a ministry of sixty years, Mr. Bayne died at Edinburgh, on the 17th January, 1790, in his eightieth year. He was twenty-four years minister of the College Street Relief congregation, Edinburgh. His popularity as a preacher, his talents for ecclesiastical affairs, his acquirements as a scholar and a theologian, and his sound judgment and weight of character, gave him great influence; and it was mainly to his large and enlightened views that the Relief church was indebted for the position to which it attained, even during his lifetime, as well as for retaining, till it was finally merged in the United Presbyterian Church, the catholic constitution on which it had been founded by Gillespie and Boston. Mr. Bayne was an uncompromising opponent of whatever he considered to be a violation of public morality. In 1770 he published a discourse, entitled *The Theatre Licentious and Perverted*, administering a stern rebuke to Mr. Samuel Foote for his *Minor*, a drama in which the characters of Whitefield and other zealous ministers were held up to profane ridicule. The dramatist considered it necessary to reply to Mr. Bayne's strictures, in an *Apology for the Minor*, in a letter to the Rev. Mr. Bayne, resting his defence upon the plea that he only satirized the vices and follies of religious pretenders. A volume of Mr. Bayne's discourses was published in 1778.

BEATON, OR BEATOUN, (CARDINAL) DAVID, who held the rectory of Campsie, the abbacy of

Aberbrothick, the bishopric of Mirepoix in France, the cardinalship of St. Stephen in Monte Cœlio, and the chancellorship of Scotland, and who was the chief of the Roman Catholic party in Scotland in the earlier age of the Reformation, was descended from an ancient family in Fife, possessed of the barony of Balfour, and was born in the year 1494. He was educated at the college of St. Andrews, where he completed his courses of polite literature and philosophy, but was sent afterwards to the university of Paris, where he studied divinity for several years. Entering into holy orders, he had the rectory of Campsie and the abbacy of Aberbrothick bestowed upon him by his uncle James Beaton, Archbishop of St. Andrews, who retained one-half of the rents of the abbacy to his own use. Possessing good abilities and a lively fancy, David Beaton became a great favourite with James V., who in 1519 sent him as his ambassador to the court of France. He returned to Scotland in 1525, and, still growing in the king's favour, was in 1528 made lord privy-seal.

In the year 1533 he was again sent on a mission to the French court. Beaton on this occasion was charged to refute certain calumnies which it was supposed the English had circulated against his countrymen, to study the preservation of the ancient league between the two nations, and to conclude a treaty of marriage between James and Magdalene, the daughter of Francis I. If unsuccessful in any of these points, he was to repair to Flanders, for the purpose of forming an alliance with the emperor. In every part of his embassy, Beaton seems to have succeeded, the marriage excepted, which was delayed on account of the declining health of Magdalene. How long Beaton remained at the French court at this time has not been ascertained; but it is certain that he was exceedingly agreeable to Francis, who, perceiving his great abilities, and aware of the influence he possessed over the mind of the Scottish king, used every expedient to attach him to the interests of France.

In 1536, finding a second embassy also unsuccessful, King James set sail for France, and proceeded to the court, where he was most cordially welcomed; and his suit being agreeable to Magdalene herself, Francis consented to their union, which was celebrated on the 1st of January, 1537. On the 28th of May following, the royal pair landed in Scotland, being conveyed by a French fleet. Magdalene was received by the Scots with the utmost cordiality; but she was already far gone in a decline, and died on the 7th of July following, to the inexpressible grief of the whole nation. It was on the death of this queen that mournings were first worn in Scotland. James, however, in expectation of this event, had fixed his attention upon Mary of Guise, widow of the Duke of Longueville; and Beaton, who by this time had returned to Scotland, was despatched immediately to bring her over. On this occasion he was appointed by the King of France Bishop of Mirepoix, to which see he was consecrated December 5th, 1537. The following year he was, at the recommendation of the French king, elevated to the cardinalship by the pope, which was followed by a grant on the part of the French king for services already done, and for those which he might afterwards do to his majesty, allowing his heirs to succeed to his estate in France, though the said heirs should be born and live within the kingdom of Scotland. The cardinal returned to Scotland with Mary of Guise, and shortly after obtained the entire management of the diocese and primacy of St. Andrews, under his uncle James Beaton, whom he eventually succeeded in that office.

A severe persecution was commenced at this time by the cardinal against all who were suspected of favouring the reformed doctrines. Many were forced to recant, and two persons, Norman Gourlay and David Straiton, were burned at the Rood of Green-side, near Edinburgh. Being appointed by the pope *legatus a latere*, Beaton held a conclave of noblemen, prelates, and church dignitaries at St. Andrews, and harangued them from his chair of state on the dangers that hung over the true catholic church from the proceedings of King Henry in England, and particularly from the great increase of heresy in Scotland, where it had found encouragement even in the court of the king. As he proceeded, he denounced Sir John Borthwick, provost of Linlithgow, as one of the most industrious incendiaries, and caused him to be cited before them for maintaining that the pope had no greater authority over Christians than any other bishop or prelate—that indulgences granted by the pope were of no force or effect, but devised to amuse the people and deceive poor ignorant souls—that bishops, priests, and other clergymen may lawfully marry—that the heresies commonly called the heresies of England and their new liturgy were to be commended by all good Christians, and to be embraced by them—that the people of Scotland are blinded by their clergy, and profess not the true faith—that churchmen ought not to enjoy any temporalities—that the king ought to convert the superfluous revenues of the church unto other pious uses—that the Church of Scotland ought to be reformed after the same manner as that of England was—that the canon law was of no force, being contrary to the law of God—that the orders of friars and monks should be abolished, as had been done in England—that he had openly called the pope a Simoniac, because he had sold spiritual things—that he had read heretical books and the New Testament in English, with treatises written by Melancthon, Ecolampadius, and other heretics, and that he not only read them himself, but distributed them among others—and lastly, that he openly disowned the authority of the Roman see. These articles being read, and Sir John neither appearing in person nor by proxy, he was set down as a confessed heretic, and condemned as an heresiarch. His goods were ordered to be confiscated and himself burned in effigy, if he could not be apprehended, and all manner of persons forbidden to entertain or converse with him, under the pain of excommunication or forfeiture. This sentence was passed against him on the 28th of May, and executed the same day so far as was in the power of the court, his effigy being burned in the market-place of St. Andrews, and two days after at Edinburgh. This was supposed by many to be intended as a gratifying spectacle to Mary of Guise, the new queen, who had only a short time before arrived from France. In the meantime, Sir John fled into England, where he was received with open arms by Henry VIII., by whom he was sent on an embassy to the Protestant princes of Germany, for the purpose of forming with them a defensive league against the pope. Johnston, in his *Heroes of Scotland*, says that "John Borthwick, a noble knight, was as much esteemed by King James V. for his exemplar and amiable qualities, as he was detested by the order of the priesthood on account of his true piety, for his unfeigned profession of which he was condemned; and, though absent, his effects confiscated, and his effigy, after being subjected to various marks of ignominy, burned," as we have above related; "this condemnation," Johnston adds, "he answered by a most learned apology, which may yet be seen in the records of the martyrs

[Fox]; and having survived many years, at last died in peace in a good old age."

During these events, Henry, anxious to destroy that interest which the French government had so long maintained in Scotland, sent into that kingdom the Bishop of St. David's with some books written in the vulgar tongue upon the doctrines of Christianity, which he recommended to his nephew carefully to peruse. James, who was more addicted to his amusements than to study, gave the books to be perused by some of his courtiers, who, being attached to the clerical order, condemned them as pestilent and heretical. There were, however, other matters proposed by this embassy than the books, though the clerical faction endeavoured to persuade the people that the books were all that was intended; for, shortly after, the same bishop, accompanied by William Howard, brother of the Duke of Norfolk, came to the king at Stirling so suddenly, that he was not aware of their coming till they were announced as arrived in the town. This, no doubt, was planned by Henry to prevent the intriguing of the priests and the French faction beforehand. His offers were so advantageous, that James acceded to them without scruple, and readily agreed to meet with his uncle Henry on an appointed day, when they were to settle all matters in dependence between them for the welfare of both kingdoms. Nothing could be more terrible to the clergy, of which Beaton was now confessedly the head in Scotland, than the agreement of the two kings; and they hastened to court from all quarters to weep over their religion, about to be betrayed by an unholy conference, which could not fail, they said, to end in the ruin of the kingdom. Having by these representations made a strong impression upon the king, they then bribed the courtiers who had the most powerful influence over him, to dissuade him from the promised journey, which they successfully did, and so laid the foundation of a war, the disastrous issue of which, preying upon the mind of James, brought him to an untimely end.

In the whole of these transactions, Beaton, a zealous churchman and the hired tool of France, was the chief actor; and knowing that the king was both covetous and needy, he overcame his scruples, by persuading the clergy to promise him a yearly subsidy of 30,000 gold crowns. As he had no design, however, that the church should defray the cost, he pointed out the estates of those who rebelled against the authority of the pope and the king as proper subjects for confiscation, whereby there might be raised annually the sum of 100,000 crowns of gold. In order to attain this object, he requested that, for himself and his brethren, they might only be allowed to name, as they were precluded themselves from sitting in judgment in criminal cases, a lord chief-justice, before whom, were he once appointed, there could be neither difficulty in managing the process, nor delay in procuring judgment, since so many men hesitated not to read the books of the New and Old Testaments, and to treat the church and churchmen with contempt. This wicked counsel was complied with, and they nominated for this new court of inquisition a judge every way according to their own hearts, James Hamilton (a natural brother of the Earl of Arran), whom they had attached to their interests by large gifts, and who was willing to be reconciled to the king, whom he had lately offended, by any service, however cruel.

The suspicions which the king entertained against his nobility from this time forward were such as to paralyze his efforts whether for good or evil. The inroads of the English, too, occupied his whole

attention, and the shameful overthrow of his army which had entered England by the Solway, threw him into such a state of rage and distraction, that he died at Falkland on the 13th of December, 1542, leaving the kingdom, torn by faction, and utterly defenceless, to his only surviving legitimate child, Mary, then no more than five days old. The sudden demise of the king, while it quashed the old projects of the cardinal, only set him upon forming new ones still more daring and dangerous. Formerly he had laboured to direct the movements of the king by humouring his passions, flattering his vanity, and administering to his vicious propensities; he now conceived that it would be easy for him to seize upon the government in the name of the infant queen. Accordingly, with the assistance of one Henry Balfour, a mercenary priest, whom he suborned, he is said to have forged a will for the king, in which he was himself nominated regent, with three of the nobility as his assessors or assistants. According to Knox, these were Argyle, Huntley, and Murray; but Buchanan, whom we think a very sufficient authority in this case, says that he also assumed as an assessor his cousin by the mother's side, the Earl of Arran, who was, after Mary, the next heir to the crown, but was believed to be poorly qualified for discharging the duties of a private life, and still less for directing the government of a kingdom. Aware of the danger that might arise from delay, the cardinal lost not a moment in idle deliberation. The will which he had forged he caused to be proclaimed at the cross of Edinburgh on the Monday immediately succeeding the king's death.

Arran, had he been left to himself, would have peaceably acquiesced in the cardinal's arrangements. But his friends, the Hamiltons, incessantly urged him not to let such an occasion slip out of his hands. Hatred, too, to the cardinal, who, from his persecuting and selfish spirit, was very generally detested, and the disgrace of living in bondage to a priest, procured them many associates. The near prospect which Arran now had of succeeding to the crown, must also have enlisted a number of the more wary and calculating politicians upon his side. But what was of still more consequence to him, Henry of England, who had carried all the principal prisoners taken in the late battle to London, marched them in triumph through that metropolis, and given them in charge to his principal nobility, no sooner heard of the death of the king than he recalled the captives to court, entertained them in the most friendly manner, and having taken a promise from each of them that they would promote as far as possible, without detriment to the public interests, or disgrace to themselves, a marriage between his son and the young queen, he sent them back to Scotland, where they arrived on the 1st of January, 1543. Along with the prisoners the Earl of Angus and his brother were restored to their country, after an exile of fifteen years, and all were received by the nation with the most joyful gratulations. It was in vain that the cardinal had already taken possession of the regency. Arran, by the advice of the laird of Grange, called an assembly of the nobility, and finding the will upon which the cardinal had assumed the regency forged, they set him aside and elected Arran in his place. This was peculiarly grateful to a great proportion of the nobles and gentlemen, three hundred of whom, with Arran at their head, were found in a proscription list among the king's papers, furnished to him by the cardinal. Arran, it was well known, was friendly to the reformers, and his imbecility of mind being unknown, the greatest expectations were formed from the moderation of his character. In the

parliament that met in the month of March following, public affairs put on a much more promising appearance than could have been expected. The king of England, instead of an army, sent an ambassador to negotiate a marriage between the young queen and his son, and a lasting peace upon the most advantageous terms. The cardinal, who saw in this alliance with Protestant England the downfall of his church in Scotland, opposed himself with the whole weight of the clergy, and all the influence of the queen-dowager, to everything like pacific measures, and that with so much violence, that he was, by the general consent of the house, shut up in a separate chamber while the votes were taken; after which everything was settled in the most amicable manner, and it was agreed that hostages should be sent into England for the fulfilment of the stipulated articles.

The cardinal in the meantime was committed as a prisoner into the hands of Lord Seton, but was afterwards suffered to resume his own castle at St. Andrews. In the great confusion of public affairs that had prevailed for a number of years, trade had been at a stand, and now that a lasting peace seemed to be established, a number of vessels were sent to sea laden with the most valuable merchandise. Edinburgh itself fitted out twelve, and the other towns on the eastern coast in proportion to their wealth, all of them coasting the English shores, and entering their harbours with the most undoubted confidence. Restored, however, to liberty, the cardinal strained every nerve to break up the arrangements that had been so happily concluded. He prevailed on a portion of the clergy to give all their own money, their silver plate, and the plate belonging to their churches; and aided by this money, with which he wrought upon the avarice and the poverty of the nobles and excited the clamours of the vulgar, who hated the very name of an English alliance, the cardinal soon found himself at the head of a formidable party, which treated the English ambassador with the greatest haughtiness, in the hope of forcing him out of the country before the arrival of the day stipulated by the treaty with the regent for the delivery of the hostages. The ambassador, however, braved every insult till the day arrived, when he waited on the regent, and complained in strong terms of the manner in which he had been used, and demanded the fulfilment of the treaty. With respect to the affronts, the regent stated them to have been committed without his knowledge, and promised to punish the offenders. With regard to the hostages, however, he was obliged to confess, that, through the intrigues of the cardinal, it was impossible for him to furnish them. The treaty being thus broken off, the noblemen who had been captives only a few months before, ought, according to agreement, to have gone back into England, having left hostages to that effect. Wrought upon, however, by the cardinal and the clergy, they refused to redeem the faith they had pledged, and abandoned the friends they had left behind them to their fate. The only exception to this baseness was the Earl of Cassilis, who had left two brothers as hostages. Henry was so much pleased with this solitary instance of good faith, that he set him free along with his brothers, and sent him home loaded with gifts. He at the same time seized upon all the Scottish vessels, a great number of which had been lately fitted out, and were at this time in the English harbours, confiscated the merchandise, and made the merchants and the mariners prisoners of war. This, while it added to the domestic miseries of Scotland, served also to fan the flames of dissension, which burned more fiercely than

ever. The faction of the cardinal and the queen-dowager, entirely devoted to France, now sent ambassadors thither to state their case as utterly desperate, unless they were supported from that country. In particular, they requested that Matthew Earl of Lennox might be ordered home, in order that they might set him up as a rival to the Hamiltons, who were already the objects of his hatred, on account of their having waylaid and killed his father at Linlithgow.

Arran laboured to strengthen his party by possessing himself of the infant queen, who had hitherto remained at Linlithgow in the charge of her mother the queen-dowager. The cardinal, however, was too wary to be thus circumvented, and occupied Linlithgow. Lennox, in the meantime, arrived from France, and having informed his friends of the expectations he had been led to form, he proceeded to join the queen at Linlithgow, accompanied by upwards of 4000 men. Arran, who had assembled all his friends in and about Edinburgh for the purpose of breaking through to the queen, now found himself completely in the back-ground, having, by the imbecility of his character, entirely lost the confidence of the people, and being threatened with a lawsuit by the friends of Lennox to deprive him of his estates, his father having married his mother, Janet Beaton, an aunt of the cardinal, while his first wife, whom he had divorced, was still alive. He now thought of nothing but making his peace with the cardinal. To this the cardinal was not at all averse, as he wished to make Arran his tool rather than his victim. Delegates of both parties met at Kirkliston, and agreed that the queen should be carried to Stirling; the Earl of Montrose, with the Lords Erskine, Lindsay, and Livingstone, being nominated to take the superintendance of her education. Having been put in possession of the infant queen, these noblemen proceeded with her direct to Stirling Castle, where she was solemnly inaugurated with the usual ceremonies on the 9th of Sept. 1543. The feeble regent soon followed, and before the queen-mother and the principal nobility in the church of the Franciscans at Stirling, solemnly abjured the Protestant doctrines, by the profession of which alone he had obtained the favour of so large a portion of the nation, and for the protection of which he had been especially called to the regency. In this manner the cardinal, through the cowardice of the regent and the avarice of his friends, obtained all that he intended by the forged will, and enjoyed all the advantages of ruling, while all the odium that attended it attached to the imbecile Arran. There was yet, however, one thing wanting to establish the power of the cardinal—the dismissal of Lennox, who was now a serious obstacle in the way of both the cardinal and the queen-mother. They accordingly wrote to the King of France, entreating that, as Scotland had been restored to tranquillity by his liberality and assistance, he would secure his own good work and preserve the peace which he had procured, by recalling Lennox, without which it was impossible it could be lasting.

Though they were thus secretly labouring to undermine this nobleman, the queen-mother and the cardinal seemed to honour him before the people, and by a constant succession of games and festivals the court presented one unbroken scene of gaiety. Day after day was spent in tournaments, and night after night in masquerades. In these festivities, of which he was naturally fond, Lennox found a keen rival in James Hepburn, Earl of Bothwell, who had been banished by James V., but had returned after his decease, and was now labouring to obtain the queen-

dowager in marriage by the same arts that Lennox fancied himself to be so successfully employing. Both these noblemen were remarkable for natural endowments, and in the gifts of fortune they were nearly upon a level. Finding himself inferior, however, in the sportive strife of arms, Bothwell withdrew from the court in chagrin, leaving the field to his rival undisputed. Lennox now pressed his suit upon the queen, but learned with astonishment that she had no intention of taking him for a husband, and so far from granting him the regency, she had agreed with the cardinal to preserve it in the possession of his mortal enemy Arran, whom they expected to be more pliant. Exasperated to the highest degree, Lennox swore to be amply revenged, but uncertain as yet what plan to pursue, departed for Dunbarton, where he was in the midst of his vassals and friends. Here he received 30,000 crowns, sent to increase the strength of his party by the King of France, who had not yet been informed of the real state of Scotland. Being ordered to consult with the queen-dowager and the cardinal in the distribution of this money, Lennox divided part of it among his friends, and part he sent to the queen. The cardinal, who had expected to have been intrusted with the greatest share of the money, under the influence of rage and disappointment, persuaded the vacillating regent to raise an army and march to Glasgow, where he might seize upon Lennox and the money at the same time. Lennox, however, warned of their intentions, raised on the instant among his vassals and friends upwards of 10,000 men, with whom he marched to Leith, and sent a message to the cardinal at Edinburgh, that he desired to save him the trouble of coming to fight him at Glasgow, and would give him that pleasure any day in the fields between Edinburgh and Leith.

This was a new and unexpected mortification to the cardinal, who had gained only the regent and his immediate dependants, the great body of the people, who had originally given him weight and influence, having now deserted his standard. The cardinal, therefore, delayed coming to action from day to day under various pretences, but in reality that he might have time to seduce the adherents of his rival, who could not be kept for any length of time together. Lennox, finding the war thus protracted, made an agreement with the regent, and, proceeding to Edinburgh, the two visited backwards and forwards, as if all their ancient animosity had been forgotten. Lennox, however, being advised of treachery, withdrew in the night secretly to Glasgow, where he fortified, provisioned, and garrisoned the bishop's castle, but retired himself to Dunbarton. Here he learned that the Douglasses had agreed with the Hamiltons, and that, through the influence of his enemies, the French king was totally estranged from him. Archibald Douglas, Earl of Angus, and Robert Maxwell, in the meantime, came to Glasgow with the view of mediating between Lennox and the regent. The regent, however, seized them both in a clandestine manner by the way, and made them close prisoners in the castle of Cadzow. While the two factions were thus harassing one another to the ruin of their common country, Henry was demanding by letters satisfaction for the breach of treaties and the insults that had been heaped upon him in the person of his late ambassador. No notice being taken of these letters, Henry ordered a large armament, which he had prepared to send against the coast of France, to proceed directly to Leith, and to visit Edinburgh and the adjacent country with all the miseries of war; and with so much secrecy and

celerity did this armament proceed, that the first tidings heard of it in Scotland was its appearance in Leith Roads. Ten thousand men were disembarked on the 4th May, 1544, a little above Leith, who took possession of that place without the smallest opposition. The regent and the cardinal were both at the time in Edinburgh, and, panic-stricken at the appearance of the enemy, and still more at the hatred of the citizens, fled with the utmost precipitation towards Stirling. The English in the meantime marched towards Edinburgh, which they sacked and set on fire; then dispersing themselves over the neighbouring country, they burned towns, villages, and gentlemen's seats to the ground, and returning by Edinburgh to Leith, embarked aboard their ships and set sail with a fair wind, carrying with them an immense booty, and with the loss on their part of only a few soldiers.

The cardinal and his puppet the regent, in the meantime, raised a small body of forces in the north, with which, finding the English gone, they laid siege to the castle of Glasgow, which surrendered. Defeated at Glasgow, in a fresh encounter with the Hamiltons, the friends of Lennox refused to risk another engagement, but they insisted that he should keep the impregnable fortress of Dunbarton, where he might in safety await another revolution in the state of parties, which they prognosticated would take place in a very short time. Nothing, however, could divert him from his purpose; and, committing the charge of the castle of Dunbarton to George Stirling, he sailed for England, where he was honourably entertained by King Henry, who settled a pension upon him, and gave him to wife his niece, Margaret Douglas, a princess in the flower of her age, and celebrated for every accomplishment becoming the female character. Arran was delighted to be delivered from such a formidable rival; and in the next parliament, which met at Linlithgow, he succeeded in causing Lennox to be declared a traitor, and in having his estates and those of his friends confiscated.

The English, during these domestic broils, made a furious inroad into Scotland, burned Jedburgh and Kelso, and laid waste the whole surrounding country. Thence proceeding to Coldingham, they fortified the church and the church-tower, in which they placed a garrison on retiring home. This garrison, from the love of plunder as well as to prevent supplies for a besieging army, wasted the neighbouring district to a wide extent. Turning their attention at last to general interests, the Scottish government, at the head of which was the cardinal, the queen-dowager, and the nominal regent Arran, issued a proclamation for the nobles and the more respectable of the commons to assemble armed, and with provisions for eight days, to attend the regent. Eight thousand men were speedily assembled, and though it was the depth of winter, they proceeded against the church and tower of Coldingham without delay. When they had been before the place only one day and one night, the regent, informed that the English were advancing from Berwick, took horse, and with a few attendants galloped in the utmost haste to Dunbar. This inexplicable conduct threw the whole army into confusion, and but for the bravery of one man, Archibald Douglas, Earl of Angus, the whole of their tents, baggage, and artillery would have been abandoned to the enemy. But although Angus and a few of his friends, at the imminent hazard of their lives, saved the artillery and brought it in safety to Dunbar, the conduct of the army in general, and of the regent in particular, was pusillanimous in the extreme. The spirit of the nation sunk, and the courage of the enemy rose in proportion. Ralph

Ivers and Brian Latoun, the English commanders, overran, without opposition, the districts of Merse, Teviotdale, and Lauderdale, and the Forth only seemed to limit their victorious arms. Angus, who alone of all the Scottish nobility at this time gave any indication of public spirit, indignant at the nation's disgrace, and deeply affected with his own losses—for he had extensive estates both in Merse and Teviotdale—made a vehement complaint to the regent upon his folly, and the regent was roused to a momentary exertion, so that, in company with Angus, he set out the very next day for the borders, their whole retinue not exceeding 300 horse. The English, who were at Jedburgh to the number of 5000 men, having ascertained the situation and small number of their forces, marched on the instant to surprise them before their expected supplies should come up. The Scots, however, apprised of their intentions, withdrew to the neighbouring hills, whence, in perfect security, they watched the movements of their enemies, who, disappointed in not finding them, wandered about during the night in quest of such spoils as a lately ravaged town could supply, and with the returning dawn marched back to Jedburgh. The Scots, now joined by Norman Leslie, a youth of great promise, son to the Earl of Rothes, and 300 men from Fife, withdrew to the hills which overlook the village of Ancrum, where they were joined by the laird of Balcleugh, an active and experienced commander, with a few of his vassals, who assured him that the remainder would follow immediately. By the advice of Balcleugh the troops were dismounted, and the horses, under the care of servants, sent to an adjoining hill. The army was formed in the hollow in the order of battle. The English, as had been anticipated, seeing the horses going over the hill, supposed the Scots to be in full retreat, and eager to prevent their escape, rushed after them, and ere they were aware fell upon the Scottish spears. Taken by surprise, the English troops, though they fought with great bravery, were thrown into disorder, and sustained a signal defeat, losing in killed and captured upwards of 1300 men. The loss on the part of the Scots was two men killed and a few wounded.

By this victory and the alliance with France, Beaton now supposed himself fully established in the civil as well as the ecclesiastic management of the kingdom, and proceeded on a progress through the different provinces for the purpose of quieting the seditions which, as he alleged, had arisen in various places, but in reality to repress the Protestants, who, notwithstanding his having so artfully identified the cause of the Catholic religion with that of national feeling, had still been rapidly increasing. Carrying Arran along with him, as also the Earl of Argyle, lord justice-general, Lord Borthwick, the Bishops of Orkney and Dunblane, &c., he came to Perth, or, as it was then more commonly called, St. Johnston, where several persons were summoned before him for disputing upon the sense of the Scriptures, which, among all true Catholics, was a crime to be punished by the judge. Four unhappy men, accused of having eaten a goose upon a Friday, were condemned to be hanged, which rigorous sentence was put into execution. A woman, Helen Stark, for having refused to call upon the Virgin for assistance in her labour, was drowned, although again pregnant. A number of the burghesses of the city, convicted or suspected (for in those days they were the same thing) of smaller peccadilloes, were banished from the city. He also deposed the Lord Ruthven from the provostry of the city, for being somewhat attached to the new opinions, and bestowed the office upon the laird of Kinfauns, a relation to the Lord Gray, who was

neither supposed to be averse to the new religion nor friendly to the cardinal; but he hoped by this arrangement to lay a foundation for a quarrel between these noblemen, by which at least one of them would be cut off. This act of tyranny, by which the citizens were deprived of their privilege of choosing their own governor, was highly resented by them, as well as by the Lord Ruthven, whose family had held the place so long that they almost considered it to be hereditary in their family. The new provost, Kinfauns, was urged by the cardinal and his advisers to seize upon the government of the city by force, but the Lord Ruthven, with the assistance of the citizens, put him to the rout, and slew sixty of his followers. That Ruthven was victorious must have been a little mortifying to the cardinal; but as the victims were enemies of the church, the defeat was the less to be lamented.

From St. Johnston the cardinal proceeded to Dundee, in order to bring to punishment the readers of the New Testament, which about this time began to be taught to them in the original Greek, of which the Scottish priesthood knew so little that they held it forth as a new book written in a new language, invented by Martin Luther, and of such pernicious qualities, that whoever had the misfortune to look into it became infallibly tainted with deadly heresy. Here, however, their proceedings were interrupted by the approach of Lord Patrick Gray and the Earl of Rothes. These noblemen being both friendly to the Reformation, the cardinal durst not admit them with their followers into a town that was notorious for attachment to that cause above all the cities of the kingdom; he therefore sent the regent back to Perth, whither he himself also accompanied him. Even in Perth, however, he durst not meet them openly, and the regent requiring them to enter separately, they complied, and were both committed to prison. Rothes was soon dismissed, but Gray, whom the cardinal was chiefly afraid of, remained in confinement a considerable time. The cardinal, having gone over as much of Angus as he found convenient at the time, returned to St. Andrews, carrying along with him a black friar, named John Rogers, who had been preaching the reformed doctrine in Angus. This individual he committed to the sea-tower of St. Andrews, where, it is alleged, he caused him to be privately murdered and thrown over the wall, giving out that he had attempted to escape over it, and in the attempt had fallen and broke his neck. Keeping Arran still in his company, the cardinal set out to Edinburgh, where he convened an assembly of the clergy to devise means for putting a stop to the disorders that threatened the total ruin of the church. In this meeting it was proposed to allay the public clamours by taking measures for reforming the open profligacy of the priests, which was the chief source of complaint. Their deliberations, however, were cut short by intelligence that George Wishart, the most eminent of the reformed preachers, was residing with Cockburn of Ormiston, only about seven miles from Edinburgh. They calculated that, if they could cut off this individual, they should perform an action more serviceable to the cause of the church, and also one of much easier accomplishment, than reforming the lives of the priests. A troop of horse were immediately sent off to secure him, but Cockburn refusing to deliver him, the cardinal himself and the regent followed, blocking up every avenue to the house, so as to render the escape of the reformer impossible. To prevent the effusion of blood, however, the Earl of Bothwell was sent for, who pledged his faith to Cockburn that he would stand by Wishart, and that no harm should befall

him; upon which he was peaceably surrendered. Bothwell, however, wrought upon by the cardinal, and especially by the queen-mother, with whom, Knox observes, "he was then in the glonders," after some shuffling to save appearances, delivered his prisoner up to the cardinal, who imprisoned him, first in the castle of Edinburgh, and soon after carried him to St. Andrews, where he was brought before the ecclesiastical tribunal, condemned for heresy, and most cruelly put to death, as the reader will find related in another part of this work under the article WISHART. Arran, pressed by his friends, and perhaps by his own conscience, wrote to the cardinal to stay the proceedings till he should have time to inquire into the matter, and threatened him with the guilt of innocent blood. But the warning was in vain, and the innocent victim was only the more rapidly hurried to his end for fear of a rescue.

This act of tyranny and murder was extolled by the clergy and their dependants as highly glorifying to God and honourable to the actor. The people in general felt far otherwise, and regarded the cardinal as a monster of cruelty and lust, whom it would be a meritorious action to destroy. Beaton was not ignorant of this general hatred, nor of the devices that were forming against him; but he supposed his power to be now so firmly established as to be beyond the reach of faction. In the meantime he thought it prudent to strengthen his interest, which was already great, by giving his daughter in marriage to the Master of Crawford. For this purpose he proceeded to Angus, where the marriage was celebrated with almost royal splendour, the bride receiving from her father the cardinal no less than four thousand marks of dowry. From these festivities he was suddenly recalled by intelligence that Henry of England was collecting a great naval force, with which he intended to annoy Scotland, and especially the coast of Fife. To provide against such an exigency, the cardinal summoned the nobility to attend him in a tour round the coast, where he ordered fortifications to be constructed, and garrisons placed in the most advantageous positions. In this tour he was attended by the Master of Rothes, Norman Leslie, who had formerly been one of his friends, but had of late, from some private grudge, become cold towards him. Some altercation of course ensued, and they parted in mortal enmity. The cardinal determined secretly to take off or imprison Norman, with his friends the lairds of Grange, elder and younger, Sir James Learmont, provost of St. Andrews, and the laird of Raith, all whom he feared; and Norman resolved to slay the cardinal, be the consequences what they would.

The cardinal was in the meantime in great haste to repair and strengthen his castle, upon which a large number of men were employed almost night and day. The conspirators having lodged themselves secretly in St. Andrews on the night of May the 28th, 1546, were, ere the dawn of the next morning, assembled to the number of ten or twelve persons in the neighbourhood of the castle, and the gates being opened to let in the workmen with their building materials, Kirkaldy of Grange entered, and with him six persons, who held a parley with the porter. Norman Leslie and his company, having then entered, passed to the middle of the court. Lastly came John Leslie and four men with him, at whose appearance the porter, suspecting some design, attempted to lift the drawbridge, but was prevented by Leslie, who leaped upon it, seized the keys, and threw the janitor into the ditch. The place thus secured, the workmen, to the number of a hundred, ran off the walls, and were put forth at the wicket gate unhurt.

Kirkaldy then took charge of the privy postern, the others going through the different chambers, from which they ejected upwards of fifty persons, who were quietly permitted to escape. The cardinal, roused from his morning slumbers by the noise, threw up his window and asked what it meant. Being answered that Norman Leslie had taken his castle, he ran to the postern, but finding it secured, returned to his chamber, drew his two-handed sword, and ordered his chamberlain to barricade the door. In the meantime, John Leslie demanded admittance, but did not gain it till a chimneyful of burning coals was brought to burn the door, when the cardinal or his chamberlain (it is not known which) threw it open. Beaton, who had in the meantime hidden a box of gold under some coals in a corner of the room, now sat down in a chair, crying, "I am a priest, I am a priest; you will not slay me." But he was now in the hands of men to whom his priestly character was no recommendation. John Leslie, according to his vow, struck him twice with his dagger, and so did Peter Carmichael; but James Melville, perceiving them to be in a passion, withdrew them, saying, "This work and judgment of God, although it be secret, ought to be gone about with gravity." Then, admonishing the cardinal of his wicked life, particularly his shedding the blood of that eminent preacher, Mr. George Wishart, Melville struck him thrice through with a stog [or short] sword, and he fell, exclaiming, "F. e. fie, I am a priest; all's gone!" Before this time the inhabitants of St. Andrews were apprised of what was going on, and began to throng around the castle, exclaiming, "Have ye slain my Lord Cardinal? What have ye done with my Lord Cardinal?" As they refused to depart till they saw him, his dead body was hung out in a sheet by the assassins at the same window from which he had but a short time before witnessed the burning of Mr. George Wishart. Having no opportunity to bury the body, they afterwards salted it, wrapped it in lead, and consigned it to the ground floor of the sea-tower, the very place where he was said to have caused Rogers the preaching friar to be murdered.

In this manner fell Cardinal David Beaton, in the height of prosperity, and in the prime of life, for he had only reached the fifty-second year of his age. His death was deeply lamented by his own party, to whom it proved an irreparable loss, and the authors of it were regarded by them as sacrilegious assassins; but by numbers, who, on account of difference in religion, were in dread of their lives from his cruelty, and by others who were disgusted by his insufferable arrogance, they were regarded as the restorers of their country's liberties, and many did not hesitate to hazard their lives and fortunes along with them. Whatever opinion may be formed regarding the manner of his death, there can be only one regarding its effects; the Protestant faith, which had quailed before his powerful intellect and persecuting arm, from this moment began to prosper in the land. It is probable, as his enemies alone have been his historians, that the traits of his character, and even the tone and bearing of many of his actions, have been to some degree exaggerated; yet there seems abundant proof of his sensuality, his cruelty, and his total disregard of principle in his exertions for the preservation of the Romish faith. Nothing, on the other hand, but that barbarism of the times which characterizes all Beaton's policy, as well as his actions, could extenuate the foul deed by which he was removed from the world, or the unseemly sympathy which the reforming party in general manifested towards its perpetrators. As a favourable view of his character, and at the same time a fine specimen of

old English composition, we extract the following from the supplement to Dempster:—

"It frequently happens that the same great qualities of mind which enable a man to distinguish himself by the splendour of his virtues are so overstrained or corrupted as to render him no less notorious for his vices. Of this we have many instances in ancient writers, but none by which it is more clearly displayed than in the character of the cardinal archbishop of St. Andrews, David Beaton, who, from his very childhood, was extremely remarkable, and whose violent death had this in it singular, that his enemies knew no way to remove him from his absolute authority but that [of assassination]. When he was but ten years of age, he spoke with so much ease and gravity, with so much good sense and freedom from affectation, as surprised all who heard him. When he was little more than twenty, he became known to the Duke of Albany and to the court of France, where he transacted affairs of the greatest importance, at an age when others begin to become acquainted with them only in books. Before he was thirty he had merited the confidence of the regent, the attention of the French king, and the favour of his master, so that they were all suitors to the court of Rome in his behalf. He was soon after made lord privy-seal, and appointed by act of parliament to attend the young king, at his majesty's own desire. Before he attained the forty-fifth year of his age he was Bishop of Mirepoix in France, Cardinal of the Roman Church, Archbishop of St. Andrews, and Primate of Scotland, to which high dignities he added, before he was fifty, those of lord high-chancellor, and legate *a latere*. His behaviour was so taking, that he never addicted himself to the service of any prince or person but he absolutely obtained their confidence; and this power he had over the minds of others he managed with so much discretion, that his interest never weakened or decayed. He was the favourite of the regent, Duke of Albany, and of his pupil James V., as long as they lived; and the French king and the governor of Scotland equally regretted his loss. He was indefatigable in business, and yet managed it with great ease. He understood the interests of the courts of Rome, France, and Scotland better than any man of his time; and he was perfectly acquainted with the temper, influence, and weight of all the nobility in his own country. In time of danger he showed great prudence and steadiness of mind, and in his highest prosperity discovered nothing of vanity or giddiness. He was a zealous churchman, and thought severity the only weapon that could combat heresy. He loved to live magnificently, though not profusely; for at the time of his death he was rich, and yet had provided plentifully for his family. But his vices were many, and his vices scandalous. He quarrelled with the old Archbishop of Glasgow in his own city, and pushed this quarrel so far that their men fought in the very church. His ambition was boundless, for he took into his hands the entire management of the affairs of the kingdom, civil and ecclesiastical, and treated the English ambassador as if he had been a sovereign prince. He made no scruple of sowing discord among his enemies, that he might reap security from their disputes. His jealousy of the governor [Arran] was such, that he kept his eldest son as a hostage in his house, under pretence of taking care of his education. In point of chastity he was very deficient; for, though we should set aside as calumnies many of those things which his enemies have reported of his intrigues, yet the posterity he left behind him plainly proves that he violated those vows, to gratify his passions, which he obliged others to hold sacred on the penalty of their lives. In

a word, had his probity been equal to his parts, had his virtues come up to his abilities, his end had been less fatal, and his memory without blemish. As it is, we ought to consider him as an eminent instance of the frailty of the brightest human faculties, and the instability of what the world calls fortune."

He wrote, according to Dempster, *Memoirs of his own Embassies, A Treatise of Peter's Primacy, and Letters to Several Princes.*

BEATON, JAMES, uncle to the preceding, and himself an eminent prelate and statesman, was a younger son of John Beaton of Balfour, in Fife, and of Mary Boswell, daughter of the Laird of Balmouto. Having been educated for the church, he became, in 1503, provost of the collegiate church of Bothwell, by the favour, it has been almost necessarily supposed, of the house of Douglas, who were patrons of the establishment. His promotion was very rapid. In 1504 he was made abbot of the rich and important abbacy of Dunfermline, which had previously been held by a brother of the king; and in 1505, on the death of his uncle, Sir David Beaton, who had hitherto been his chief patron, he received his office of high treasurer, and became, of course, one of the principal ministers of state. On the death of Vaus, Bishop of Galloway, in 1508, James Beaton was placed in that see, and next year he was translated to the arch-episcopate of Glasgow. He now resigned the treasurer's staff, in order that he might devote himself entirely to his duties as a churchman. While Archbishop of Glasgow, he busied himself in what were then considered the most pious and virtuous of offices, namely, founding new altars in the cathedral, and improving the accommodations of the episcopal palace. He also entitled himself to more lasting and rational praise by such public acts as the building and repairing of bridges within the regality of Glasgow. Upon all the buildings, both sacred and secular, erected by him, were carefully blazoned his armorial bearings. During all the earlier part of his career, this great prelate seems to have lived on the best terms with the family of Douglas, to which he must have been indebted for his first preferment. In 1515, when it became his duty to consecrate the celebrated Gavin Douglas as Bishop of Dunkeld, he testified his respect for the family by entertaining the poet and all his train in the most magnificent manner at Glasgow, and defraying the whole expenses of his consecration. Archbishop Beaton was destined to figure very prominently in the distracted period which ensued upon the death of James IV. As too often happens in the political scene, the violence of faction broke up his old attachment to the Douglases. The Earl of Angus, chief of that house, having married the widow of the king, endeavoured, against the general sense of the nation, to obtain the supreme power. Beaton, who was elevated by the regent Albany to the high office of lord-chancellor, and appointed one of the governors of the kingdom during his absence in France, attached himself to the opposite faction in the Hamiltons, under the Earl of Arran. On the 29th of April, 1520, a convention having been called to compose the differences of the two parties, the Hamiltons appeared in military guise, and seemed prepared to vindicate their supremacy with the sword. Beaton, their chief counsellor, sat in his house at the bottom of the Blackfriars' Wynd,¹ with armour under his robes, ready, apparently, to have joined the forces of the Hamiltons, in the event of a quarrel. In this crisis Gavin Douglas was deputed by his nephew the Earl of Angus to remonstrate with the archbishop against the hostile preparations of his

¹ Lane.

party. Beaton endeavoured to gloss over the matter, and concluded with a solemn asseveration upon his conscience that he knew not of it. As he spoke, he struck his hand upon his breast, and caused the mail to rattle under his gown. Douglas replied, with a cutting equivoque, "Methinks, my lord, your conscience clatters,"—as much as to say, your conscience is unsound, at the same time that the word might mean the undue disclosure of a secret. In the ensuing conflict which took place upon the streets, the Hamiltons were worsted, and Archbishop Beaton had to take refuge in the Blackfriars' Church. Being found there by the Douglasses, he had his rochet torn from his back, and would have been slain on the spot but for the interposition of the Bishop of Dunkeld. Having with some difficulty escaped, he lived for some time in an obscure way, till the return of the Duke of Albany, by whose interest he was appointed, in 1523, to the metropolitan see of St. Andrews. On the revival of the power of the Douglasses in the same year, he was again obliged to retire. It is said that the insurrection of the Earl of Lennox, in 1525, which ended in the triumph of the Douglasses and the death of the earl at Linlithgow Bridge, was stirred up by Archbishop Beaton, as a means of emancipating the king. After this unhappy event, the Douglasses persecuted him with such keenness that, to save his life, he assumed the literal guise and garb of a shepherd, and tended an actual flock upon Bogrian-Knowe in Fife. At length, when James V. asserted his independence of these powerful tutors, and banished them from the kingdom, Beaton was reinstated in all his dignities, except that of chancellor, which was conferred upon Gavin Dunbar, the king's preceptor. He henceforward resided chiefly at St. Andrews, where, in 1527, he was induced, by the persuasions of other churchmen less mild than himself, to consent to the prosecution and death of Patrick Hamilton, the proto-martyr of the Scottish Reformation. He was subsequently led on to various severities against the reformers, but rather through a want of power to resist the clamours of his brethren, than any disposition to severity in his own nature. It would appear that he latterly intended much of the administration of his affairs to his less amiable nephew. The chief employment of his latter years was to found and endow the New College of St. Andrews, in which design, however, he was thwarted in a great measure by his executors, who misapplied the greater part of his funds. He died in 1539.

BEATON, JAMES, Archbishop of Glasgow, was the second of the seven sons of John Beaton, or Bethune, of Balfour, elder brother of Cardinal Beaton. He received the chief part of his education at Paris, under the care of his celebrated uncle, who was then residing in the French capital as ambassador from James V. His first preferment in the church was to be chanter of the cathedral of Glasgow, under Archbishop Dunbar. When his uncle attained to nearly supreme power, he was employed by him in many important matters, and in 1543 succeeded him as Abbot of Aberbrothick. The death of the cardinal does not appear to have materially retarded the advancement of his nephew; for we find that, in 1552, he had sufficient interest with the existing government to receive the second place in the Scottish church, the archbishopric of Glasgow, to which he was consecrated at Rome. He was now one of the most important personages in the kingdom; he enjoyed the confidence of the governor, the Earl of Arran; his niece, Mary Beaton, one of the "Four Maries," was the favourite of the young Queen Mary, now residing in France; and he was also esteemed very

highly by the queen-dowager, Mary of Lorraine, who was now aspiring to the regency. During the subsequent sway of the queen regent, the Archbishop of St. Andrews enjoyed her highest confidence. It was to him that she handed the celebrated letter addressed to her by John Knox, saying, with a careless air, "Please you, my lord, to read a pasquil." In 1557, when the marriage of the youthful Mary to the Dauphin of France was about to take place, James Beaton, Archbishop of St. Andrews, stood the first of the parliamentary commissioners appointed to be present at the ceremony, and to conduct the difficult business which was to precede it. He and his companions executed this duty in a most satisfactory manner. After his return in 1558 he acted as a privy-councillor to the queen regent, till she was unable any longer to contend with the advancing tide of the Reformation. In November, 1559, his former friend, the Earl of Arran, who had now become a leading reformer, came with a powerful retinue to Glasgow, and, to use a delicate phrase of the time, "took order" with the cathedral, which he cleared of all the images, placing a garrison at the same time in the archbishop's palace. Beaton soon after recovered his house by means of a few French soldiers; but he speedily found that neither he nor his religion could maintain a permanent footing in the country.

In June, 1560, the queen regent expired, almost at the very moment when her authority became extinct. Her French troops, in terms of a treaty with the reformers, sailed next month for their native country; and in the same ships was the Archbishop of Glasgow, along with all the plate and records of the cathedral, which he said he would never return till the Catholic faith should again be triumphant in Scotland. Some of these articles were of great value. Among the plate, which was very extensive and rich, was a golden image of Christ, with silver images of his twelve apostles. Among the records, which were also very valuable, were two chartularies, one of which had been written in the reign of Robert III., and was called *The Red Book of Glasgow*. All these objects were deposited by the archbishop in the Scots College at Paris, where the manuscripts continued to be of use to Scottish antiquaries up to the period of the French Revolution, when, it is believed, they were destroyed or dispersed. Beaton was received by Queen Mary at Paris with the distinction due to a virtuous and able counsellor of her late mother. On her departure next year, to assume the reins of government in Scotland, she left him in charge of her affairs in France. He spent the whole of the subsequent part of his life as ambassador from the Scottish court to his most Christian Majesty. This duty was one of extreme delicacy during the brief reign of Queen Mary, when the relation of the two courts was of the most important character. Mary addressed him frequently in her own hand, and a letter in which she details to him the circumstances of her husband's death is a well-known historical document.

It is not probable that Beaton's duty as an ambassador during the minority of James VI. was anything but a titular honour; but that prince, on taking the government into his own hands, did not hesitate, notwithstanding the difference of religion, to employ a statesman who had already done faithful service to the two preceding generations. James also, in 1587, was able to restore to him both his title and estates as Archbishop of Glasgow—a proceeding quite anomalous, when we consider that the presbyterian religion was now established in Scotland. The archbishop died, April 24, 1603, in the eighty-sixth year of his age, and a full jubilee of years from his consecration. He had been ambassador to three genera-

JAMES OGLETHORPE

AS FOUNDER OF THE COLONY OF GEORGIA

tions of the Scottish royal family, and had seen in France a succession of six kings, and transacted public affairs under five of them. He also had the satisfaction of seeing his sovereign accede to the English throne. James learned the intelligence of his death while on his journey to London, and immediately appointed the historian Spottiswoode to be his successor in the cathedral chair of Glasgow. Archbishop Spottiswoode characterizes him as "a man honourably disposed, faithful to the queen while she lived, and to the king her son; a lover of his country, and liberal, according to his means, to all his countrymen." His reputation, indeed, is singularly pure, when it is considered with what vigour he opposed the Reformation. He appears to have been regarded by the opposite party as a conscientious, however mistaken man, and to have been spared accordingly all those calumnies and sarcasms with which party rage is apt to bespatter its opponents. Having enjoyed several livings in France, besides the less certain revenues of Glasgow, he died in possession of a fortune amounting to 80,000 livres, all of which he left to the Scots College, for the benefit of poor scholars of Scotland—a gift so munificent, that he was afterwards considered as the second founder of the institution, the first having been a Bishop of Moray, in the year 1325. Besides all this wealth, he left an immense quantity of diplomatic papers, accumulated during the course of his legation at Paris; which, if they had been preserved to the present time, would unquestionably have thrown a strong light upon the events of his time.

BEATSON, ROBERT, LL.D. an ingenious and useful author, was a native of Dysart, where he was born in 1742. Being educated with a view to the military profession, he obtained an ensigncy in 1756 at the commencement of the Seven Years' war. He served next year in the expedition to the coast of France, and afterwards, as lieutenant, in the attack on Martinique, and the taking of Guadaloupe. In 1766 he retired on half-pay, and did not again seek to enter into active life till the breaking out of the American war. Having failed on this occasion to obtain an appointment suitable to his former services, he resolved to apply himself to another profession—that of literature—for which he had all along had considerable taste. His publications were: 1. *A Political Index to the Histories of Great Britain and Ireland*, 1 vol. 8vo, 1786, of which a third edition, in 3 volumes, was published at a late period of his life. This work consists chiefly of accurate and most useful lists of all the ministers and other principal officers of the state, from the earliest time to the period of its publication. 2. *Naval and Military Memoirs of Great Britain, from 1727 to the present time*, 3 vols. 8vo, 1790; 2d edition, 6 vols. 1804. 3. *View of the Memorable Action of the 27th July, 1778*, 8vo, 1791. 4. *Essay on the Comparative Advantages of Vertical and Horizontal Windmills*, 8vo, 1798. 5. *Chronological Register of both Houses of Parliament, from 1706 to 1807*, 3 vols. 8vo, 1807. Also some communications to the board of agriculture, of which he was an honorary member. This laborious author enjoyed in his latter years the situation of barrack-master at Aberdeen, where, if we are not mistaken, he received his degree of LL.D. He died at Edinburgh, January 24, 1818.

BEATTIE, JAMES, poet and moral philosopher, was born on the 25th October, 1735, at Laurencekirk, then an obscure hamlet in Kincardineshire. His father, James Beattie, was a small shop-keeper in the village, and at the same time rented a little

farm in the neighbourhood. His mother's name was Jean Watson, and they had six children, of whom the subject of this article was the youngest. The father was a man of information and of character superior to his condition, and the mother was also a person of abilities; on the early death of her husband, she carried on the business of his shop and farm, with the assistance of her eldest son, and thus was able to rear her family in a comfortable manner.

Young Beattie, who, from his earliest years, was considered a child of promise, received the rudiments of a classical education at the parish school, which had been taught forty years before by Ruddiman, and was at this time a seminary of considerable reputation. His avidity for books, which, in such a scene might have otherwise remained unsatisfied, was observed by the minister, who kindly admitted him to the use of his library. From a copy of Ogilvy's Virgil, obtained in this way, he derived his first notions of English versification. Even at this early period, his turn for poetry began to manifest itself, and among his school-fellows he went by the name of *the Poet*. In 1749, being fourteen years of age, he commenced an academical course at Marischal College, Aberdeen, and was distinguished by Professor Blackwell as the best scholar in the Greek class. Having entitled himself by this superiority to a bursary, he continued at the college for three years more, studying philosophy under the distinguished Gerard, and divinity under Dr. Pollock. His original destination being for the church, he read a discourse in the hall, which met with much commendation, but was at the same time remarked to be *poetry in prose*. Before the period when he should have taken his trials before the presbytery, he relinquished all thoughts of the clerical profession, and settled as school-master of the parish of Fordoun, near his native village.

In this humble situation, Beattie spent the years between 1753 and 1758. In the almost total want of society, he devoted himself alternately to useful study and to poetical recreation. It was at this period of life his supreme delight to saunter in the fields the livelong night, contemplating the sky, and marking the approach of day. At a small distance from the place of his residence, a deep and extensive glen, finely clothed with wood, runs up into the mountains. Thither he frequently repaired; and there several of his earliest pieces were written. From that wild and romantic spot he drew, as from the life, some of the finest descriptions and most beautiful pictures of nature that occur in his poetical compositions. It is related that, on one occasion, having lain down early in the morning on the bank of his favourite rivulet, adjoining to his mother's house, he had fallen asleep; on awaking, it was not without astonishment that he found he had been walking in his sleep, and that he was then at a considerable distance (about a mile and a half) from the place where he had lain down. On his way back to that spot, he passed some labourers, and inquiring of them if they had seen him walking along, they told him that they had, with his head hanging down, as if looking for something he had lost. Such an incident, though by no means unexampled, shows to what a degree Beattie was now the creature of impulse and imagination. He was, indeed, exactly the fanciful being whom he has described in *The Minstrel*. Fortunately for Beattie, Mr. Garden, advocate (afterwards Lord Gardenstone), who at that time resided in the neighbourhood, found him one day sitting in one of his favourite haunts, employed in writing with a pencil. On discovering that he was engaged in

the composition of poetry, Mr. Garden became interested, and soon found occasion to honour the young bard with his friendship and patronage. Beattie at the same time became acquainted with Lord Monboddo, whose family seat was within the parish.

In 1757, when a vacancy occurred in the place of usher to the grammar-school of Aberdeen, Beattie applied for it, and stood an examination, without success. On the place becoming again vacant next year, he had what he considered the good fortune to be elected. This step was of some importance to him, as it brought him into contact with a circle of eminent literary and professional characters, who then adorned the colleges of Aberdeen, and to whom he soon made himself favourably known.

In 1760 one of the chairs in the Marischal College, became vacant by the death of Dr. Duncan, professor of natural philosophy. Beattie, whose ambition had never presumed to soar to such an object, happened to mention the circumstance in conversation, as one of the occurrences of the day, to his friend Mr. Arbuthnot, merchant in Aberdeen;¹ who surprised him with a proposal that he should apply for the vacant situation. With a reluctant permission from Beattie, he exerted his influence with the Earl of Errol to apply, by means of Lord Milton, to the Duke of Argyll, who then dispensed the crown patronage of Scotland; and to the astonishment of the subject of the application, he received the appointment. By an accommodation, however, with the nominee to another vacant chair, he became professor of moral instead of natural philosophy; an arrangement suitable to the genius and qualifications of both the persons concerned.

By this honourable appointment, Beattie found himself, through an extraordinary dispensation of fortune, elevated in the course of two years from the humble and obscure situation of a country parish schoolmaster, to a place of very high dignity in one of the principal seats of learning in the country, where he could give full scope to his talents, and indulge, in the greatest extent, his favourite propensity of communicating knowledge. His first business was to prepare a course of lectures, which he began to deliver to his pupils during the session of 1760-1, and which, during subsequent years, he greatly improved. In the discharge of his duties he was indefatigable; not only delivering the usual lectures, but taking care, by frequent recapitulations and public examinations, to impress upon the minds of his auditors the great and important doctrines which he taught.

So early as the year 1756 Dr. Beattie had occasionally sent poetical contributions to the *Scots Magazine* from his retirement at Fordoun. Some of these, along with others, he now arranged in a small volume, which was published at London, 1760, and dedicated to the Earl of Errol, his recent benefactor. His *Original Poems and Translations*—such was the title of the volume—made him favourably known to the public as a poet, and encouraged him to further exertions in that branch of composition. He also studied verse-making as an art, and in 1762 wrote his *Essay on Poetry*, which was published in 1776, along with the quarto edition of his *Essay on Truth*. In 1763 he visited London from curiosity, and in 1765 he published a poem of considerable length, but unfortunate design, under the title of *The Judgment of Paris*, which threatened to be as fatal to his poetical career, as its subject had been to the Trojan state. In 1766 he published an enlarged edition of his

poems, containing among other compositions *The Judgment of Paris*; but this poem he never afterwards reprinted. His object was to make the classical fable subservient to the cause of virtue, by personifying wisdom, ambition, and pleasure in the characters of three goddesses, an idea too metaphysical to be generally liked, and which could scarcely be compensated by the graces of even Beattie's muse.

Gray, the author of the *Elegy in a Country Church-yard*, visited Scotland in the autumn of 1765, and lived for a short time at Glamis Castle with the Earl of Strathmore. Beattie, whose poetical genius was strongly akin to that of Gray, wrote to him, intreating the honour of an interview; and this was speedily accomplished by an invitation for Dr. Beattie to Glamis Castle, where the two poets laid the foundation of a friendship that was only interrupted by the death of Gray in 1771.

Some time previous to September, 1766, Beattie commenced a poem in the Spenserian stanza; a description of verse to which he was much attached, on account of its harmony, and its admitting of so many fine pauses and diversified terminations. The subject was suggested to him by the dissertation on the old minstrels, which was prefixed to Dr. Percy's *Reliques of Ancient English Poetry*, then just published. In May, 1767, he informs his friend Blacklock at Edinburgh, that he wrote 150 lines of this poem some months before, and had not since added a single stanza. His hero was not then even born, though in the fair way of being so; his parents being described and married. He proposed to continue the poem at his leisure, with a description of the character and profession of his ideal minstrel; but he was wofully cast down by the scantiness of the poetical taste of the age.

On the 28th of June, 1767, Dr. Beattie was married, at Aberdeen, to Miss Mary Dun, the only daughter of Dr. James Dun, rector of the grammar-school of that city. The heart of the poet had previously been engaged in honourable affection to a Miss Mary Lindsay, whom, so late as the year 1823, the writer of this memoir heard recite a poem written by Beattie in her praise, the lines of which commenced with the letters of her name in succession. The venerable lady was the widow of a citizen of Montrose, and in extreme though healthy old age.

At this period infidelity had become fashionable to a great extent in Scotland, in consequence of the *éclat* which attended the publication of Hume's metaphysical treatises. Attempts had been made by Drs. Reid and Campbell, in respective publications, to meet the arguments of the illustrious sceptic; but it was justly remarked by the friends of religion, that the treatises of these two individuals assumed too much of that deferential tone towards the majesty of Mr. Hume's intellect and reputation, which was to be complained of in society at large, and no doubt was one of the causes why his sceptical notions had become so fashionable. It occurred to Dr. Beattie, and he was encouraged in the idea by his friends Dr. Gregory, Sir William Forbes, and other zealous adherents of Christianity, that a work treating Hume a little more roughly, and not only answering him with argument, but assailing him and his followers with ridicule, might meet the evil more extensively, and be more successful in bringing back the public to a due sense of religion. Such was the origin of his *Essay on Truth*, which was finished for the press in autumn, 1769.

It is curious that this essay, so powerful as a defence of religion, was only brought into the world by means of a kind of pious fraud. The manuscript was committed to Sir William Forbes and Mr.

¹ Father to Sir William Arbuthnot, Bart., who was lord-provost of Edinburgh at the visit of George IV. in 1822.

Arbuthnot, at Edinburgh, with an injunction to dispose of it to any bookseller who would pay a price for it, so as to insure its having the personal interest of a tradesman in pushing it forward in the world. Unfortunately, however, the publisher to whom these gentlemen applied, saw so little prospect of profit in a work on the unfashionable side of the argument, that he positively refused to bring it forth unless at the risk of the author; a mode to which it was certain that Dr. Beattie would never agree. "Thus," says Sir William Forbes, "there was some danger of a work being lost, the publication of which, we flattered ourselves, would do much good in the world."

"In this dilemma it occurred to me," continues Beattie's excellent biographer, "that we might, without much artifice, bring the business to an easy conclusion by our own interposition. We therefore resolved that we ourselves should be the purchasers, at a sum with which we knew Dr. Beattie would be well satisfied, as the price of the first edition. But it was absolutely necessary that the business should be glossed over as much as possible, otherwise we had reason to fear that he would not consent to our taking on us a risk which he himself had refused to run."

"I therefore wrote him (nothing surely but the truth, although, I confess, not the whole truth), that the manuscript was sold for fifty guineas, which I remitted to him by a bank-bill; and I added that we had stipulated with the bookseller who was to print the book that we should be partners in the publication. On such trivial causes do things of considerable moment often depend; for had it not been for this interference of ours in this somewhat ambiguous manner, perhaps the *Essay on Truth*, on which all Dr. Beattie's future fortunes hinged, might never have seen the light."

In the prosecution of his design, Dr. Beattie has treated his subject in the following manner: he first endeavours to trace the different kinds of evidence and reasoning up to their first principles; with a view to ascertain the standard of truth, and explain its immutability. He shows, in the second place, that his sentiments on this head, how inconsistent soever with the genius of scepticism, and with the principles and practice of sceptical writers, are yet perfectly consistent with the genius of true philosophy, and with the practice and principles of those whom all acknowledge to have been the most successful in the investigation of truth; concluding with some inferences or rules, by which the most important fallacies of the sceptical philosophers may be detected by every person of common sense, even though he should not possess acuteness of metaphysical knowledge sufficient to qualify him for a logical confutation of them. In the third place, he answers some objections, and makes some remarks, by way of estimate of scepticism and sceptical writers.

The essay appeared in May, 1770, and met with the most splendid success. It immediately became a shield in the hands of the friends of religion, wherewith to intercept and turn aside the hitherto resistless shafts of the sceptics. A modern metaphysician may perhaps find many flaws in the work; but, at the time of its publication, it was received as a complete and triumphant refutation of all that had been advanced on the other side. Under favour of the *état* which attended the publication, religion again raised its head, and for a time infidelity was not nearly so fashionable as it had been.

After getting this arduous business off his mind, Beattie returned to his long Spenserian poem, and in 1771 appeared the first part of *The Minstrel*,

without his name. It was so highly successful that he was encouraged to republish this, along with a second part, in 1774; when his name appeared in the title-page. "Of all his poetical works, *The Minstrel* is, beyond all question, the best, whether we consider the plan or the execution. The language is extremely elegant, the versification harmonious; it exhibits the richest poetic imagery, with a delightful flow of the most sublime, delicate, and pathetic sentiment. It breathes the spirit of the purest virtue, the soundest philosophy, and the most exquisite taste. In a word, it is at once highly conceived and admirably finished."¹ Lord Lyttleton thus expressed his approbation of the poem—one of the most warmly conceived compliments that was ever perhaps paid by a poet to his fellow: "I read *The Minstrel* with as much rapture as poetry, in her sweetest, noblest charms, ever raised in my mind. It seemed to me, that my once most beloved minstrel, Thomson, was come down from heaven, refined by the converse of purer spirits than those he lived with here, to let me hear him sing again the beauties of nature and finest feelings of virtue, not with human but with angelic strains!" It is to be regretted that Beattie never completed this poem. He originally designed that the hero should be employed in the third canto in rousing his countrymen to arms for defence against a foreign invasion, and that, overpowered and banished by this host, he should go forth to other lands in his proper character of a wandering minstrel. It must always be recollected, in favour of this poem, that it was the first of any length, in pure English, which had been published by a Scottish writer in his own country—so late has been the commencement of this department of our literature.

Beattie visited London a second time in 1771, and, as might be expected from his increased reputation, entered more largely into literary society than on the former occasion. Among those who honoured him with their notice, was Dr. Johnson, who had been one of the warmest admirers of the *Essay on Truth*. In 1773 he paid another visit to the metropolis, along with his wife, and was received into a still wider and more eminent circle than before. On this occasion the university of Oxford conferred upon him an honorary degree of Doctor of Laws.

The chief object of this tour was to secure a provision which his friends had led him to expect from the government, in consideration of his services in the cause of religion. Many plans were proposed by his friends for obtaining this object. A bishop is believed to have suggested to the king, that the author of the *Essay on Truth* might be introduced to the English church, and advanced according to his merits; to which the king, however, is said to have slyly replied, that as Scotland abounded most in infidels, it would be best for the general interests of religion that he should be kept there. George III., who had read and admired Beattie's book, and whose whole mind ran in favour of virtue and religion, suggested himself the more direct plan of granting him a pension of £200 a year, which was accordingly carried into effect. The king also honoured Dr. Beattie with his particular notice at a *levée*, and further granted him the favour of an interview in his private apartments at Kew for upwards of an hour. The agreeable conversation and unassuming manners of Dr. Beattie appear to have not only made a most favourable impression upon the king and queen—for her majesty also was present at this interview—but upon every member of

¹ Forbes' *Life of Beattie*.

that lofty circle of society to which he was introduced.

Even after he had been thus provided for, several dignified clergymen of the Church of England continued to solicit him to take orders; and one bishop went so far as directly to tempt him with the offer of a rectorate worth £500 a year. He had no disinclination to the office of a clergyman, and he decidedly preferred the government and worship of the English church to the Presbyterian system of his own country. But he could not be induced to take such a reward for his efforts in behalf of religion, lest his enemies might say that he had never contemplated any loftier principle than that of bettering his own circumstances. Nearly about the same time, he further proved the total absence of a mercenary tinge in his character, by refusing to be promoted to the chair of moral philosophy in the university of Edinburgh. His habits of life were now, indeed, so completely associated with Aberdeen and its society, that he seems to have contemplated any change, however tempting, with a degree of pain.

About this time, some letters passed between him and Dr. Priestley, on occasion of an attack made by the latter on the *Essay on Truth*. In his correspondence with this ingenious but petulant adversary, Dr. Beattie shows a great deal of candour and dignity. He had at first intended to reply, but this intention he appears afterwards to have dropped: "Dr. Priestley," says he, "having declared that he will answer whatever I may publish in my own vindication, and being a man who loves bustle and book-making, he wishes above all things that I should give him a pretext for continuing the dispute. To silence him by force of argument, is, I know, impossible."

In the year 1786, Beattie took a keen interest in favour of a scheme then agitated, not for the first time, to unite the two colleges of Aberdeen. In the same year, he projected a new edition of Addison's prose works, with a biographical and critical preface to the extent of half a volume, in which he meant to show the peculiar merits of the style of Addison, as well as to point out historically the changes which the English language has undergone from time to time, and the hazard to which it is exposed of being debased and corrupted by modern innovations. He was reluctantly compelled by the state of his health to retrench the better part of this scheme. The works of Addison were published under his care, in 1790, by Messrs. Creech and Sibbald, booksellers, Edinburgh, but he could only give Tickell's *Life*, together with some extracts from Dr. Johnson's *Remarks on Addison's Prose*, adding a few notes of his own, to make up any material deficiency in Tickell's narrative, and illustrating Johnson's critique by a few occasional annotations. Though these additions to his original stock of materials are very slight, the admirer of Addison is much gratified by some new information which he was ignorant of before, and to which Dr. Beattie has given a degree of authenticity, by adhering, even in this instance, to his general practice of putting his name to everything he wrote.

In 1787 Dr. Beattie made application to the Marischal College, while the project of the union was still pending, desiring that his eldest son, James Hay Beattie, then in his twentieth year, should be recommended to the crown as his assistant and successor in the chair of moral philosophy. The letter in which this application was made, sets forth the extraordinary qualifications of his son, with a delightful mixture of delicacy and warmth. The young

man was an excellent Greek and Latin scholar; wrote and talked beautifully in the latter language, as well as in English; and, to use the language of his father, the best of his genius lay entirely towards theology, classical learning, morals, poetry, and criticism. The college received the application with much respect, and, after a short delay on account of the business of the union, gave a cordial sanction to the proposal.

Unfortunately for the peace of Dr. Beattie's latter years, his son, while in the possession of the highest intellectual qualifications, and characterized by every virtue that could be expected from his years, was destined by the inherent infirmity of his constitution for an early death. After his demise, which happened on the 19th of November, 1790, when he had just turned two and twenty, Dr. Beattie published a small collection of his writings, along with an elaborate preface, entering largely into the character and qualifications of the deceased. In this, he was justified by the admiration which he heard everywhere expressed of the character and intellect of his son; but, as posterity appears to have reduced the prodigy to its proper limits, which were nothing wonderful, it is unnecessary to bring it further into notice.

Dr. Beattie bore the loss of his son with an appearance of fortitude and resignation. Yet, although his grief was not loud, it was deep. He said, in a subsequent letter, alluding to a monument which he had erected for his son, "I often dream of the grave that is under it: I saw, with some satisfaction, on a late occasion, that it is very deep, and capable of holding my coffin laid on that which is already in it;" words that speak more eloquently of the grief which this event had fixed in the heart of the writer, than a volume could have done.

Another exemplification of the rooted sorrow which this event planted in the mind of Beattie, occurs in a letter written during a visit in England, in the subsequent summer. Speaking of the commemoration music, which was performed in Westminster Abbey, "by the greatest band of musicians that ever were brought together in this country," he tells that the state of his health could not permit him to be present. Then recollecting his son's accomplishment as a player on the organ, he adds, "Perhaps this was no loss to me. Even the organ of Durham Cathedral was too much for my feelings; for it brought too powerfully to my remembrance another organ, much smaller indeed, but more interesting, which I can never hear any more."

In 1790 Dr. Beattie published the first volume of his *Elements of Moral Science*, the second volume of which did not make its appearance till 1793. He had, in 1776, published a series of *Essays* on poetry and music, on laughable and ludicrous composition, and on the utility of classical learning. In 1783 had appeared *Dissertations, Moral and Critical*; and in 1786 a small tract entitled *The Evidences of the Christian Religion briefly and plainly stated*. All of these minor productions originally formed part of the course of prelections which he read from his chair in the university; his aim in their publication being "to inure young minds to habits of attentive observation; to guard them against the influence of bad principles; and to set before them such views of nature, and such plain and practical truths, as might at once improve the heart and the understanding, and amuse and elevate the fancy." His *Elements of Moral Science* was a summary of the whole of that course of lectures, a little enlarged in the doctrinal parts, with the addition of a few illustrative examples. In a certain degree, this work may be

considered as a text-book; it is one, however, so copious in its extent, so luminous in its arrangement and language, and so excellent in the sentiments it everywhere inculcates, that if the profound metaphysician and logician do not find in it that depth of science which they may expect to meet with in other works of greater erudition, the candid inquirer after truth may rest satisfied that, if he has studied these *Elements* with due attention, he will have laid a solid foundation on which to build all the knowledge of the subject necessary for the common purposes of life. Of such of the lectures as had already appeared in an extended shape, under the name of *Essays*, particularly those on the theory of language, and on memory and imagination, Dr. Beattie has made this abridgment as brief as was consistent with any degree of perspicuity; while he bestowed no less than seventy pages on his favourite topic, the abolition of the slave-trade, and the subject of slavery connected with it.

While delighting the world with the quick succession and variety of his productions, Dr. Beattie was himself nearly all the while a prey to the severest private sufferings. Mrs. Beattie had unfortunately inherited from her mother a tendency to madness. Though this did not for a considerable time break out into open insanity, yet in a few years after their marriage it showed itself in caprices and follies, which embittered every hour of her husband's life. Dr. Beattie tried for a long time to conceal her disorder from the world, and if possible, as he has been heard to say, from himself; but at last, from whim, caprice, and melancholy, it broke out into downright frenzy, which rendered her seclusion from society absolutely necessary. During every stage of her illness, he watched and cherished her with the utmost tenderness and care; using every means at first that medicine could furnish for her recovery, and afterwards, when her condition was found to be perfectly hopeless, procuring for her, in an asylum at Musselburgh, every accommodation and comfort that could tend to alleviate her sufferings. "When I reflect," says Sir William Forbes, "on the many sleepless nights and anxious days which he experienced from Mrs. Beattie's malady, and think of the unwearied and unremitting attention he paid to her, during so great a number of years in that sad situation, his character is exalted in my mind to a degree which may be equalled, but I am sure never can be excelled, and makes the fame of the poet and the philosopher fade from my remembrance."

The pressure of this calamity—slow but certain—the death of his eldest son, and the continued decline of his health, made it necessary, in the session of 1793-4, that he should be assisted in the duties of his class. From that period till 1797, when he finally relinquished his professorial duties, he was aided by Mr. George Glennie, his relation and pupil. He experienced an additional calamity in 1796, by the sudden death of his only remaining son, Montague, a youth of eighteen, less learned than his brother, but of still more amiable manners, and whom he had designed for the English church. This latter event unthrew the mind of Beattie, who, it may be remarked, had always been greatly dependent on the society, and even on the assistance, of his children. The care of their education, in which he was supposed to be only over-indulgent, had been his chief employment for many years. This last event, by rendering him childless, dissolved nearly the last remaining tie which bound him to the world, and left him a miserable wreck upon the shores of life. Many days had not elapsed after the death of

Montague Beattie, ere he began to display symptoms of a decayed intellect, in an almost total loss of memory respecting his son. He would search through the whole house for him, and then say to his niece and housekeeper, Mrs. Glennie, "You may think it strange, but I must ask you, if I have a son, and where he is." This lady would feel herself under the painful necessity of bringing to his recollection the death-bed sufferings of his son, which always restored him to reason. And he would then, with many tears, express his thankfulness that he had no child, saying, with allusion to the malady they might have derived from their mother, "How could I have borne to see their elegant minds mangled with madness?" When he looked for the last time on the dead body of his son, and thought of the separation about to take place between himself and the last being that connected him with this sublunary scene, he said, "Now, I have done with the world!" After this, he never bent his mind again to study, never touched the violoncello, on which he used to be an excellent and a frequent player, nor answered the letters of his friends, except perhaps a very few.

In March, 1797, Dr. Beattie became completely crippled with rheumatism, and in the beginning of 1799 he experienced a stroke of palsy, which for eight days so affected his speech that he could not make himself understood, and even forgot several of the most material words of every sentence. At different periods after this, he had several returns of the same afflicting malady; the last, in October, 1802, deprived him altogether of the power of motion. He lingered for ten months in this humiliating situation, but was at length relieved from all his sufferings by the more kindly stroke of death, August 18, 1803. He expired without the least appearance of suffering. His remains were deposited close to those of his two sons in the ancient cemetery of St. Nicolas, and were marked soon after by a monument, for which Dr. James Gregory of Edinburgh supplied an elegant inscription.

The eminent rank which Dr. Beattie holds as a Christian moral philosopher is a sufficient testimony of the public approbation of his larger literary efforts. It may, however, be safely predicted that his reputation will, after all, centre in his *Minstrel*, which is certainly his most finished work, and, everything considered, the most pleasing specimen of his intellect.

The mind of Beattie is so exactly identified with his works, and is so undisguisedly depicted in them, that when his works are described, so also is his character. His whole life was spent in one continued series of virtuous duties. His piety was pure and fervent; his affection for his friends enthusiastic; his benevolence unwearied; and the whole course of his life irreproachable. The only fault which his biographer, Sir William Forbes, could find in the whole composition of his character, was one of a contingent and temporary nature: he became, towards the end of his life, a little irritable by continued application to metaphysical controversy. To a very correct and fine taste in poetry he added the rare accomplishment of an acquaintance, to a considerable extent, with both the sister arts of painting and music: his practice in drawing never went, indeed, beyond an occasional grotesque sketch of some friend, for the amusement of a social hour. In music he was more deeply skilled, being not only able to take part in private concerts on the violoncello, but capable of appreciating the music of the very highest masters for every other instrument. In his person, he was of the middle height, though not elegantly, yet not awkwardly formed, but with something of a slouch in his

gait. His eyes were black and piercing, with an expression of sensibility somewhat bordering on melancholy, except when engaged in cheerful conversation and social intercourse with his friends, when they were exceedingly animated. Such was "the Minstrel."

BELL, ANDREW, D.D., author of the *Madras System of Education*, was born at St. Andrews, in 1753, and educated at the university of that place. The circumstances of his early life, and even the date of his entering into holy orders, are not known; but it is stated that he was remarkable in youth for the exemplary manner in which he fulfilled every public and private duty. After having spent some time in America, we find him, in 1786, officiating as one of the ministers of St. Mary's, at Madras, and one of the chaplains of Fort St. George.

In that year the directors of the East India Company sent out orders to Madras that a seminary should be established there for the education and maintenance of the orphans and distressed male children of the European military. The proposed institution was at first limited to the support of a hundred orphans: half the expense was defrayed by the Company, and half by voluntary subscriptions; and the Madras government appropriated Egmore Redoubt for the use of the establishment. The superintendence of this asylum was undertaken by Dr. Bell, who, having no object in view but the gratification of his benevolence, refused the salary of 1200 pagodas (£480) which was attached to it. "Here," he reasoned with himself, "is a field for a clergyman to animate his exertion, and encourage his diligence. Here his success is certain, and will be in proportion to the ability he shall discover, the labour he shall bestow, and the means he shall employ. It is by instilling principles of religion and morality into the minds of the young that he can best accomplish the ends of his ministry: it is by forming them to habits of diligence, industry, veracity, and honesty, and by instructing them in useful knowledge, that he can best promote their individual interest, and serve the state to which they belong—two purposes which cannot, in sound policy, or even in reality, exist apart.

With these feelings, and with this sense of duty, Dr. Bell began his task. He had to work upon the most unpromising materials; but the difficulties he had to encounter led to that improvement in education with which his name is connected. Failing to retain the services of properly qualified ushers, he resorted to the expedient of conducting his school through the medium of the scholars themselves. It is in the mode of conducting a school by means of mutual instruction that the discovery of Dr. Bell consists; and its value, as an abbreviation of the mechanical part of teaching, and where large numbers were to be taught economically, could not be easily over-estimated at the time, although later educationists have improved upon the plan; and the Madras system is now less in use than formerly. The first new practice which Dr. Bell introduced into his school was that of teaching the letters by making the pupils trace them in sand, as he had seen children do in a Malabar school. The next improvement was the practice of syllabic reading. The child, after he had learned to read and spell monosyllables, was not allowed to pronounce two syllables till he acquired by long practice a perfect proficiency. From the commencement of his experiment he made the scholars, as far as possible, do everything for themselves: they ruled their own paper, made their own pens, &c., with the direction only of their teacher. The maxim

of the school was, that no boy could do anything right the first time, but he must learn when he first set about it, by means of his teacher, so as to be able to do it himself ever afterwards. Every boy kept a register of the amount of work which he performed, so that his diligence at different times might be compared. There was also a black book, in which all offences were recorded: this was examined once a week; and Dr. Bell's custom, in almost every case of ill-behaviour, was to make the boys themselves judges of the offender. He never had reason, he says, to think their decision partial, biassed, or unjust, or to interfere with their award otherwise than to mitigate or remit the punishment, when he thought the formality of the trial and of the sentence was sufficient to produce the effect required. But the business of the teachers was to preclude punishment by preventing faults; and so well was this object attained, that for months together it was not found necessary to inflict a single punishment.

An annual saving of not less than £960 upon the education and support of two hundred boys was produced in the institution at Madras by Dr. Bell's regulations and improvements. This, however, he justly regarded as an incidental advantage: his grand aim was to redeem the children from the stigma under which they laboured, and the fatal effect which that stigma produced, and to render them good subjects, good men, and good Christians. After superintending the school for seven years, he found it necessary for his health to return to Europe. The directors of the charity passed a resolution for providing him a passage in any ship which he might wish to sail in, declaring at the same time that, under "the wise and judicious regulations which he had established, the institution had been brought to a degree of perfection and promising utility far exceeding what the most sanguine hopes could have suggested at the time of its establishment; and that he was entitled to their fullest approbation for his zealous and disinterested conduct." The language in which Dr. Bell spoke of the institution, on leaving it, will not be read without emotion by those who are capable of appreciating what is truly excellent in human nature. During seven years which he had devoted to this office, he had "seen the vices incident to the former situation of these orphans gradually vanishing, their morals and conduct approaching nearer and nearer every year to what he wished them to be, and the character of a race of children in a manner changed." "This numerous family," said he, "I have long regarded as my own. These children are, indeed, mine by a thousand ties. I have for them a parental affection, which has grown upon me every year. For them I have made such sacrifices as parents have not always occasion to make for their children; and the nearer the period approaches when I must separate myself from them, the more I feel the pang I shall suffer in tearing myself from this charge, and the anxious thoughts I shall throw back upon these children when I shall cease to be their protector, their guide, and their instructor." Eleven years after he had left India, Dr. Bell received a letter, signed by forty-four of these pupils, expressing, in the strongest terms, their gratitude for the instruction and care which he had bestowed upon them in childhood.

On his arrival in Europe, Dr. Bell published, in 1797, a pamphlet, entitled *An Experiment in Education made at the Male Asylum of Madras; suggesting a System by which a School or Family may teach itself, under the Superintendence of the Master or Parent*. The first place in England where the system was adopted was the charity school of St. Bodolph's,

Aldgate. Dr. Briggs, then of Kendal, the second who profited by Dr. Bell's discovery, introduced it into the Kendal schools of industry. These occurrences took place in 1798. In 1801 the system was fully and successfully acted upon in the schools of the society for bettering the condition of the poor.

In 1803 Mr. Joseph Lancaster first appeared before the public. He published a pamphlet with the following title:—*Improvements in Education, as it respects the Industrious Classes of the Community; containing a short Account of its Present State, Hints towards its Improvement, and a Detail of some Practical Experiments conducive to that end.* "The institution," he says, "which a benevolent Providence has been pleased to make me the happy instrument of bringing into usefulness, was begun in the year 1798. The intention was to afford the children of mechanics, &c., instruction in reading, writing, and arithmetic, at about half the usual price." The peculiarity of his plan seems to have consisted chiefly in introducing prizes and badges of merit, together with a mode of teaching spelling, which was said to economize time and trouble: he also called in the assistance of boys, as monitors. In his pamphlet of 1803 he freely accords to Bell the priority of the mutual system, acknowledging also that the published account of it had furnished him with several useful hints. Eventually, Mr. Lancaster put forward a claim, obviously unfounded, to be considered the sole inventor of the system. One of his advertisements in the newspapers was thus introduced:—"Joseph Lancaster, of the Free School, Borough Road, London, having invented, under the blessing of divine Providence, a new and mechanical system of education for the use of schools, feels anxious to disseminate the knowledge of its advantages through the United Kingdom. By this system, paradoxical as it may appear, above 1000 children may be taught and governed by one master only." And on another occasion he writes:—"I stand forward before the public, at the bar of mankind, to the present, and for the future ages, avowing myself the inventor of the British or Royal Lancasterian System."—(*Morning Post*, 4th September.) Again: "I submit the plan, original as it is, to the country. The same cannot be found in any other work unless copied or pirated."—(Preface to edition of 1808.)

But however unfounded Lancaster's claim to originality may be, there can be no doubt that, through his exertions chiefly, the system was extensively reduced to practice in England. Belonging to the sect of Quakers—a body whose exertions in the cause of philanthropy are universally known—he did not apply to them in vain for pecuniary support and personal exertion. Lancasterian schools were rapidly established in all parts of the kingdom.

Dr. Bell lived long enough to witness the introduction of his system into 12,973 national schools, educating 900,000 of the children of his English countrymen, and to know that it was employed extensively in almost every other civilized country. He acquired in later life the dignity of a prebendary of Westminster, and was master of Sherborn Hospital, Durham. He was also a member of the Asiatic Society, and of the Royal Society of Edinburgh. He employed himself during his latter years in writing several works on education, among which the most valuable were, *The Elements of Tuition*, *The English School*, and a *Brief Manual of Mutual Instruction and Discipline*. The evening of his pious and useful life was spent at Cheltenham, in the practice of every social and domestic virtue. Previously to his death, he bestowed £120,000, three per cent. stock, for the purpose of founding an academy on an extensive and liberal scale in his native city. He

also bequeathed a considerable sum for purposes of education in Edinburgh; which, however, to the everlasting disgrace of the individuals intrusted with the public affairs of that city at the time, was compromised among the general funds of that corporation a few months before its bankruptcy.

Dr. Bell died on the 27th of January, 1832, in the eightieth year of his age, and was buried in Westminster Abbey, the Archbishop of Canterbury and the Bishop of London acting as chief mourners.

BELL, BENJAMIN, a distinguished surgical author, was born in Dumfries in 1749. He received an excellent classical education at the grammar-school of that town, under Dr. Chapman, the rector. The property of Blakett House, in Dumfriesshire, having devolved to him on the death of his grandfather, he gave a remarkable instance of generosity by disposing of it, and applying the proceeds in educating himself and the younger branches of the family—fourteen in number.

Mr. Bell had early made choice of medicine as a profession, and accordingly he was bound apprentice to Mr. Hill, surgeon in Dumfries, whose practice was in that quarter very extensive. It was a distinguishing feature in Mr. Bell's character, that whatever he had once engaged in was prosecuted with extreme ardour and assiduity. He therefore went through the drudgery and fatigue necessarily connected with the detail of a surgeon-apothecary's shop with the greatest spirit. He, by degrees, materially assisted his master by attending his patients—to whom his correct behaviour, unfeeling good humour, and agreeable manners recommended him in the most powerful manner. He repaired to Edinburgh in 1766, entered himself as a member of the university, and set himself, with the most serious application, to the prosecution of his medical studies. The Edinburgh medical school had just sprung into notice, and was beginning to make very rapid strides to its present eminence. The first and second Monro had already given evident tokens of the most distinguished genius. The first had now relinquished, in favour of his equally skilful son, the business of the anatomical theatre, and only occasionally delivered clinical lectures in the infirmary. Mr. Bell's ardour in the study of anatomy, in all its branches, was unabated. As he proposed to practise surgery, he was well aware that eminence in that department of the profession could only be arrived at by persevering industry. He was appointed house-surgeon to the Royal Infirmary, which afforded him every opportunity of improvement. It was here that he laid the foundation of that superior adroitness and dexterity which so peculiarly characterized him in the many hazardous but successful operations which he was called to perform.

Though Mr. Bell was more particularly designed for the profession of a surgeon, he neglected no department of medicine. Dr. Black, whose discoveries formed a new era in the science of chemistry, had been removed from Glasgow to Edinburgh during the year in which Mr. Bell entered the university. His lectures and experiments proved generally attractive, and powerfully interested the mind of Bell. Dr. Cullen was professor of the institutes of medicine, and his original genius excited the greatest ardour amongst the students. The practice of medicine was taught by Dr. John Gregory, and botany by Dr. John Hope. These were the professors whom Mr. Bell attended, and it must be confessed that they were men of distinguished talents, to whose lectures no diligent student could listen without deriving very great advantage.

Mr. Bell had resolved, in 1770, to visit Paris and London—the two great schools for surgical practice. Before doing so, however, he passed the examinations at Surgeons' Hall, and was admitted a member of the Royal College of Surgeons, Edinburgh. In those great cities he remained nearly two years, assiduously improving himself in surgery. Returning to his native country in 1772, he commenced business in Edinburgh. Few came better prepared than he did for the practice of surgery. His education was liberal and extensive. His appearance was much in his favour. His address was good, his manner composed and sedate. Mr. Bell had early formed the plan of composing a system of surgery—and this he at last accomplished. He did not publish the whole work at once; but in the year 1778, about six years after he had finally settled in Edinburgh, and become established in practice, the first volume was given to the world. The remaining volumes appeared from time to time until the work was completed in six volumes, 8vo, in 1788. In 1793 appeared his *Treatise on Gonorrhœa*, and in 1794 another *Treatise on Hydrocele*, which is understood to be the least popular of his works.

Mr. Bell married, in 1776, Miss Hamilton, daughter of Dr. Robert Hamilton, professor of divinity in the university of Edinburgh, by whom he had a numerous family. He died, April 4, 1806.

BELL, SIR CHARLES, was born at Edinburgh in 1774. His father was a minister of the Scottish Episcopal Church, and held a small living at Doune, in the county of Perth. As the minister died while still young, his family, consisting of four sons, were thrown upon the maternal care; but this, instead of being a disadvantage, seems to have produced a contrary effect, by the early development of their talents, so that they all attained distinguished positions in society, the first as a writer to the signet, the second as an eminent surgeon, and the third as professor of Scots law in the university of Edinburgh. Charles, the youngest, was less favourably situated than his brothers for a complete education, but his own observation and natural aptitude supplied the deficiency. "My education," he tells us, "was the example of my brothers." The care of his mother did the rest, so that her youngest and best-beloved child at last outstripped his more favoured seniors, and his grateful remembrance of her lessons and training continued to the end of his life. The history of such a family justifies the saying which the writer of this notice has often heard repeated by a learned professor of the university of Glasgow: "When I see," he said, "a very talented youth who makes his way in the world, I do not ask, Who was his father? but, Who was his mother?" On being removed to the high-school of Edinburgh—where, by the way, he made no distinguished figure—Charles was chiefly under the charge of his brother John, subsequently the eminent surgeon, and it was from him he derived that impulse which determined his future career. He studied anatomy, and with such proficiency that, even before he had reached the age of manhood, he was able to deliver lectures on that science, as assistant of his brother John, to a class of more than a hundred pupils. In 1799, even before he was admitted a fellow of the Royal College of Surgeons of Edinburgh, he published the first part of his *System of Dissections*. Longing, however, for a wider field of action, and disgusted with the medical controversies in Edinburgh, he removed to London in 1804. It was a bold step; for at this time, owing to political causes, a Scotsman of education was regarded with suspicion and

dislike in this favourite field of Scottish adventure, and Charles Bell was looked upon as an interloper come to supplant the true children of the English soil. But he bravely held onward in his course, and won for himself the esteem of influential friends, the chief of whom were Sir Astley Cooper and Dr. Abernethy, and he soon extended the circle by his treatise on the *Anatomy of Expression*, which was published in London in 1806. It was a work so admirably suited for painters, in their delineations of human feeling and passion, that the most distinguished artists of the day adopted it for their text-book, and were loud in their encomiums of its merits. Still, however, this was but the foundation-stone of his future distinction. Bell had determined to be "chief of his profession in character," and to attain this daring height much had to be surmounted. He commenced as a public lecturer, but upon a humble and disadvantageous scale, as he was still an alien in London; and his early discoveries upon the nervous system, which he was patiently maturing, as his future highest claims to distinction, were as yet but little esteemed by the public, and would be compelled to force their way slowly into notice, if they should ever chance to be noticed. In 1807, the same year in which he commenced his course of lectures, he published his *System of Operative Surgery*, a work where all the operations described in it were the result not of mere theory or reading, but of personal experience.

It was amidst this disheartening amount of unthanked, unappreciated toil and disappointment that Charles Bell sought a comforter of his cares; and in 1811 he married Miss Shaw, who not only justified his choice, but made him brother-in-law to two men whose pursuits were congenial to his own. These were John and Alexander Shaw, whom his lessons and example raised into distinguished anatomists and physiologists, while the latter ultimately became the most effective champion of his preceptor's claims to originality in his physiological and anatomical discoveries. Bell's darkened horizon now began to clear, and his worth to be properly estimated. In 1811, the happy year of his marriage, after he had long remained unconnected with any medical school or association, he was allied to the Hunterian School in Windmill Street, as joint-lecturer with Mr. Wilson. The extent of his knowledge and power of illustrating it, exhibited in his prelections, and the happy facility of demonstration and language, which he had always at command, soon made his lectures popular, so that in 1814 he was appointed surgeon to the Middlesex Hospital; and here his remarkable skill as an operator, combined with his style of lecturing, which although not eloquent, was full of thought very strikingly expressed, made him a favourite both with patients and pupils. The result of his labours there, which continued till 1836, enabled him to make the honest boast at his departure, that he had left the institution, which at his entrance was but of small account, "with full wards, and £120,000 in the funds."

As the whole of the preceding period, up to the date of Napoleon's banishment to St. Helena, had been a season of war, the professional talents of Bell had been in request in our military hospitals, and upon the Continent, as well as in London, so that in 1809, immediately after the battle of Corunna, he quitted the metropolis, to attend upon the wounded of the British army. Here his opportunities of acquiring fresh knowledge were eagerly embraced, and the result of his experience was an essay on gun-shot wounds, which appeared as an appendix to his *System of Operative Surgery*, published in 1807.

After the battle of Waterloo, he also repaired to Brussels, and took the charge of an hospital; and here he was engaged for three successive days and nights in operating upon and dressing the wounds of three hundred soldiers. Of these cases he made various drawings in water-colouring, which are reckoned among the best specimens of such productions in our anatomical school.

The time at length arrived when Bell was to acquire that full amount of reputation for which he had toiled so long and laboriously, and amidst such unmerited neglect. From an early period his favourite subject of investigation was the nervous system, upon which the most erroneous opinions had hitherto prevailed. Even professional men of high medical and anatomical knowledge rested satisfied in the belief that all the nerves were alike, and that the superior amount of susceptibility in any organ merely depended upon the greater number of nerves allotted to it. But even before he left Edinburgh, a suspicion had grown upon the mind of Bell, that this prevalent opinion was erroneous, and further inquiry satisfied him that his suspicion was right. He found that the nerves were distributed into different classes, to each of which belonged its proper function; and that the same puncture which, applied to any other of these conductors to the senses, would produce a sensation of pain, when applied to the eye would give only the impression of a flash of light. He saw, also, that the two roots by which the spinal nerves are connected with the vertebral medulla, impart two different powers, the one of motion, the other of sensation. In this way he accounted for those cases in which the motive or sensitive powers are singly or severally lost. This discovery, which was as wonderful as that of the circulation of the blood, astonished the whole medical world: it was a revelation that had remained unknown till now, and when announced could not be controverted; and under this new guidance, practical anatomists were directed to the proper seat of the ailments that came under their notice, as well as taught the right mode of cure. His theory, which was published in 1821 in the *Philosophical Transactions*, in the form of an essay on the "Nervous System," produced immediate attention, and when its value was appreciated, attempts were made to deny him the merit of the discovery. Fortunately, however, for his claims, he had printed a pamphlet for distribution among his friends as early as 1811, in which the principal points of his theory were already announced; while his letters, written to his brother upon the subject, were sufficient to put to flight the numerous pretenders who claimed the discovery as their own. His subsequent publications on the *Nervous Circle*, and *On the Eye*, completely established the existence of a sixth sense, by which we are enabled to ascertain and estimate the qualities of size, weight, form, distance, texture, and resistance.

Bell had now reached the summit of his ambition, and established for himself a European reputation. His improvements were adopted in every country where the healing art was studied as a science, while the leading men of the Continent united in testifying to the value of his labours. In 1824 he was appointed to the senior chair of anatomy and surgery in the London College of Surgeons, while his treatises on *Animal Mechanics*, and *On the Hand*, and his *Illustrations of Paley's Natural Theology*, secured that professional distinction which seemed capable of no further extension. On the accession of William IV. to the throne, it was resolved to commemorate this event by conferring the honour of knighthood upon a few of the most eminent scientific men of the

period, and in this chosen number Bell was included, with his countrymen Brewster, Leslie, and Ivory. An opportunity now occurred for Sir Charles Bell to return to Scotland, after an absence of thirty-two years, by an offer in 1836 of the professorship of surgery in the university of Edinburgh, which he accepted. It was his prevailing desire, notwithstanding his wide and lucrative practice in London, to have leisure for prosecuting his scientific researches, and to prosecute them among the friends of his youth, and in the place where they had commenced. But unfortunately he found Edinburgh too limited a field for his purposes, and especially for a new and great work upon the *Nervous System*, which he wished to publish, with numerous splendid illustrations. Instead of this he was obliged to content himself with a new edition of the *Anatomy of Expression*, which he greatly extended and improved, in the course of a tour through Italy, during the interval of a college session. He also published his *Institutes of Surgery*, containing the substance of his lectures delivered in the university. In 1842 during the vacation of summer, Sir Charles left Edinburgh on a journey to London; but, on reaching Hallow Park on the 27th of May, he died suddenly the same night. The cause of his death was *angina pectoris*, brought on, as was supposed by his friends, from disappointment, chiefly arising from the new medical reform bill, which he believed was hostile to the best interests of the profession. His intellectual originality, acuteness of perception, and steady perseverance, by which he attained such distinguished reputation and success, were connected with an amenity and gentleness of disposition, that endeared him to the circle of his friends and the society in which he moved. An excellent portrait and striking likeness of Sir Charles Bell was painted by B. Mantyne, of which an engraving by Thomson will be found in the third volume of *Pettigrew's Medical Portrait Gallery*.

BELL, HENRY, the first successful applier of steam to the purposes of navigation in Europe, was born at Torphichen in Linlithgowshire, April 7, 1767. He was sprung from a race of mechanics, being the fifth son of Patrick Bell and Margaret Easton, whose ancestors, through several descents, were alike well known in the neighbourhood as ingenious millwrights and builders; some of them having also distinguished themselves in the erection of public works, such as harbours, bridges, &c., not only in Scotland, but also in the other divisions of the United Kingdom. Henry Bell, after receiving a plain education at the parish school, began in 1780 to learn the handicraft of a stone-mason. Three years after he changed his views in favour of the other craft of the family, and was apprenticed to his uncle, who practised the art of a mill-wright. At the termination of his engagement he went to Borrowstonness for the purpose of being instructed in ship-modelling; and in 1787 he engaged with Mr. James Inglis, engineer at Bells-hill, with the view of completing his knowledge of mechanics. He afterwards went to London, where he was employed by the celebrated Mr. Rennie; so that his opportunities of acquiring a practical acquaintance with the higher branches of his art were altogether very considerable.

About the year 1790 Bell returned to Scotland, and it is said that he practised for several years at Glasgow the unambitious craft of a house-carpenter. He was entered, October 20, 1797, as a member of the corporation of wrights in that city. It was his wish to become an undertaker of public works in Glasgow; but either from a deficiency of capital, or

from want of steady application, he never succeeded to any extent in that walk. "The truth is," as we have been informed, "Bell had many of the features of the enthusiastic projector—never calculated means to ends, or looked much farther than the first stages or movements of any scheme. His mind was a chaos of extraordinary projects, the most of which, from his want of accurate scientific calculation, he never could carry into practice. Owing to an imperfection in even his mechanical skill, he scarcely ever made one part of a model suit the rest, so that many designs, after a great deal of pains and expense, were successively abandoned. He was, in short, the hero of a thousand blunders and one success." It may easily be conceived that a mechanic open to this description could not succeed, to any great extent, as either a designer or executor of what are called public works. The idea of propelling vessels by means of steam early took possession of his mind. "In 1800 (he writes) I applied to Lord Melville, on purpose to show his lordship and the other members of the admiralty the practicability and great utility of applying steam to the propelling of vessels against winds and tides, and every obstruction on rivers and seas where there was depth of water. After duly thinking over the plan, the lords of that great establishment were of opinion that the plan proposed would be of no value in promoting transmarine navigation." He repeated the attempt in 1803, with the same result, notwithstanding the emphatic declaration of the celebrated Lord Nelson, who, addressing their lordships on the occasion, said, "My lords, if you do not adopt Mr. Bell's scheme, other nations will, and in the end vex every vein of this empire. It will succeed (he added), and you should encourage Mr. Bell." Having obtained no support in this country, Bell forwarded copies of the prospectus of his scheme to the different nations of Europe, and to the United States of America. "The Americans," he writes, "were the first who put my plan into practice, and were quickly followed by other nations." Mr. Watt himself had no faith in the practicability of applying his own great discovery to the purpose of navigation. In a letter addressed to Mr. Bell he said, "How many noblemen, gentlemen, and engineers have puzzled their brains, and spent their thousands of pounds, and none of all these, nor yourself, have been able to bring the power of steam in navigation to a successful issue." The various attempts which preceded that of Bell are briefly noticed in the following extract from the *Fifth Report of the Select Committee of the House of Commons on Steamboats, June, 1822: Sir Henry Parnell, Chairman*. Mentioning the following as experimenters, namely, Mr. Jonathan Hulls, in 1736; the Duke of Bridgewater, on the Manchester and Runcorn canal; Mr. Miller of Dalswinton; the Marquis de Jouffroy (a French nobleman), in 1781; Lord Stanhope, in 1795; and Mr. Symington and Mr. Taylor, on the Forth and Clyde Canal, in 1801-2; the *Report* proceeds:—"These ingenious men made valuable experiments, and tested well the mighty power of steam. Still no practical uses resulted from any of these attempts. It was not till the year 1807, when the Americans began to use steamboats on their rivers, that their safety and utility was first proved. But the merit of constructing these boats is due to natives of Great Britain. Mr. Henry Bell of Glasgow gave the first model of them to the late Mr. Fulton of America, and corresponded regularly with Fulton on the subject. Mr. Bell continued to turn his talents to the improving of steam apparatus, and its application to various manufactures about Glasgow; and in 1811 constructed the *Comet* steamboat, the first of the kind in Europe, to navigate

the Clyde, from Glasgow to Port-Glasgow, Greenock, Helensburgh, and Inverness." An interesting recollection of Mr. Miller's experiments on Dalswinton Lake has been preserved by Mr. James Nasmyth, the eminent engineer, on the authority of his father, who was present on the occasion. "The parties in the boat on that memorable occasion," writes Mr. Nasmyth to Mr. D. O. Hill, the landscape painter, who has introduced the lake into his picture of the valley of the Nith, "were Miller (of Dalswinton), Taylor (the engineer), Robert Burns (the poet), Henry Brougham (the future lord-chancellor), and Alexander Nasmyth (the father of landscape painting in Scotland)—a fit and worthy crew to celebrate so great an event. Many a time (adds the writer) I have heard my father describe the delight which this first and successful essay at steam-navigation yielded the party in question. I only wish Burns had immortalized it in rhyme, for indeed it was a subject worthy of his muse."

In 1808 Bell removed to the modern village of Helensburgh, on the Firth of Clyde, where his wife undertook the superintendence of the public baths, and at the same time kept the principal inn, whilst he continued to prosecute his favourite scheme, without much regard to the ordinary affairs of the world. In 1812 he produced his steamboat, the *Comet*, of 30 tons burden, with an engine of three horse-power. The *Comet*, so called from the celebrated comet which appeared at that time, was built by Messrs. John Wood and Co., at Port-Glasgow, and made her trial trip on the 18th of January, when she sailed from Glasgow to Greenock, making five miles an hour against a head-wind. In August of the same year we find Bell advertising the *Comet* to ply upon the Clyde three times a week from Glasgow, "to sail by the power of air, wind, and steam." In September the voyage was extended to Oban and Fort-William, and was to be accomplished to and from the latter place in four days. Mr. Bell lived to see his invention universally adopted. The Clyde, which first enjoyed the advantages of steam-navigation, became the principal seat of this description of ship-building; and, at the present time, Clyde-built steamers maintain their superiority in every port in the world. Steamships are now launched from the building-yards of Glasgow and Greenock of 2000 tonnage, and 800 horse-power; and Clyde-built ships, with Glasgow engines, make the voyage betwixt Liverpool and New-York in ten days. Steamboat building and marine-engine making received their first powerful impulse from the solution of the problem of ocean steam-navigation. From tables, constructed by Dr. Strang from returns furnished to him by the various ship-builders and engineers in Glasgow, Dumbarton, Greenock, and Port-Glasgow, it appears that, during the seven years from 1846 to 1852, there were constructed at Glasgow and in its neighbourhood 123 vessels, of which 1 was of wood, 122 of iron, 80 paddle, and 43 screw; consisting of 200 wooden tonnage; 70,441 iron tonnage; 6610 horse-power engines for wooden hulls, 22,539 horse-power engines for iron hulls, and 4720 horse-power engines for vessels not built on the Clyde. During the same period there were constructed in Dumbarton, 58 vessels, all of iron, 20 being for paddles and 38 for screws, and having a tonnage of 29,761; and during the last three years of the same period, 3615 horse-power engines were made there for iron hulls, and 200 horse-power engines for vessels not built on the Clyde. During the same period, from 1846 to 1852, there were constructed at Greenock and Port-Glasgow, 66 steam-vessels, of which 13 were of wood and 53 of iron, 41 paddle and 25 screw; consisting

of 18,131 wood tonnage and 29,071 iron tonnage, 129 horse-power engines for wooden hulls, 5439 horse-power engines for iron hulls, and 4514 horse-power engines for vessels not built on the Clyde. For the whole ports in the Clyde, the steam-vessels built and the marine engines made, from 1846 to 1852, were as follows:—Number of steam-vessels built—wood hulls, 14; iron hulls, 233; in all, 247; of these 141 were paddles, and 106 screws. The tonnage of the wooden steamers amounts to 18,331, of the iron to 129,273. The engines' horse-power in wood hulls was 6739, the engines' horse-power in iron hulls was 31,593; while there was of engines' horse-power for vessels not constructed on the Clyde, 9434, making a grand total of 247 steamers, amounting to 147,604 tons, and of engines 47,766 horse-power. Coming nearer to the present day, we may state that the ship-building yards on the Clyde alone turned out, in 1863, 170 vessels of 124,000 tonnage; in 1864, 242 vessels of 178,505 tonnage; and in 1865, 257 vessels of every size and character, with 151,297 of tonnage and 23,857 of horse-power. On the 1st of January, 1866, there were in the hands of the ship-builders orders for 178 vessels, with a tonnage of 291,270 tons, and a horse-power of 42,607. Such was the rapid progress in a few years of steam-ship building on the river where Henry Bell first tried his great experiment. The steam communication which has, for several years, existed betwixt our West Indian and North American colonies and the mother country, has recently been extended to Australia and the Cape of Good Hope, thus uniting Great Britain to her most distant dependencies by new and powerful ties, and literally realizing the vivid description of George Canning, who, dilating on the benefits of steam-navigation, several years before the death of Bell, described it as "that new and mighty power, new at least in the application of its might, which walks the water like a giant, rejoicing in its course, stemming alike the tempest and the tide—accelerating intercourse—shortening distances—creating, as it were, unexpected neighbourhoods, and new combinations of social and commercial relations, and giving to the fckleness of winds, and the faithlessness of waves, the certainty and steadiness of a highway upon the land." Whilst commerce and civilization were thus making rapid progress by means of his invention, Henry Bell reaped no personal advantage from it. He even approached the confines of old age in very straitened circumstances. Touched by his condition, the late Dr. Cleland, and a number of other benevolent individuals, commenced a subscription on his behalf, by which a considerable sum was raised. The trustees on the river Clyde granted him an annuity of £100, which was continued to his widow. This was but a becoming acknowledgment of the value of his great invention on the part of the trustees of a river whose annual revenue was increased, mainly by the impulse given to its trade by steam-navigation, from £6676 in 1810, the year before Bell commenced the construction of the *Comet*, to £20,296 in 1830, the year in which he died; and which has been more than tripled during the subsequent twenty-two years, being in 1852 £76,000. Within the same space of time, the channel of the river has undergone a corresponding improvement, being rendered navigable by ships of 700 and 800 tons burden; whereas, little more than half a century ago it was navigable only by coal gabbards and vessels of 30 to 45 tons. The average available depth of the Clyde at high water of neap tides is 16 feet, with an additional depth of two or three feet at spring-tides. At the Broomielaw, the harbour of Glasgow, there are now 10,000 lineal

feet of quayage, giving accommodation to hundreds of the largest ships belonging to the mercantile marine of this and foreign countries. Mr. Bell died at Helensburgh, March 14, 1830, aged sixty-three, and lies buried in the Row churchyard. An obelisk to his memory was erected on the rock of Dunglass, a promontory on the Clyde, about $2\frac{1}{2}$ miles above Dunbarton.

BELL, JAMES. This indefatigable geographer was born in 1769, in Jedburgh. His father, the Rev. Thomas Bell, minister of a Relief congregation in that town, and afterwards of Dovehill Chapel in Glasgow, was a man of great worth and considerable learning, and the author of a *Treatise on the Covenants*, and several other pieces of a theological kind. In his childhood and youth the subject of our memoir suffered much sickness, and gave little promise either of bodily or mental vigour; but, as he grew up, his constitution improved, and he began to evince that irresistible propensity to reading, or rather devouring all books that came in his way, which ever afterwards marked his character. It was fortunate for him that he was not bereft of his natural guardian until he was considerably advanced in life, for he was quite unfit to push his own way in the world, the uncommon simplicity of his character rendering him the easy dupe of the designing and knavish. He indeed entered into business for a short time, as a manufacturer, with his characteristic ardour, but finding himself unsuccessful, he betook himself to another and more laborious mode of making a livelihood, but one for which he was far better qualified, namely, the private teaching of Greek and Latin to advanced students. But as his father, with parental prudence, had settled a small annuity upon him, he was enabled to devote a considerable portion of his time to those studies and researches to which his natural inclination early led him, and which he only ceased to prosecute with his life. Mr. Bell used to advert with feelings of peculiar satisfaction to the meetings of a little weekly society which, during this period of his history, were held at his house and under his auspices, and at which the members read essays and debated questions for their mutual entertainment and improvement. On all these occasions, Mr. Bell never failed to contribute his full share to the evening's proceedings, and, when fairly excited, would astonish and delight his associates, particularly the younger part of them, with the extent and variety of his learning, and the astonishing volubility with which he poured forth the treasures of his capacious and well-furnished mind on almost every possible topic of speculation or debate.

Mr. Bell's first appearance as an author was made about the year 1815, when he contributed several valuable chapters to the *Glasgow Geography*—a work which had an extensive circulation, published in five volumes 8vo, by the house of Khull, Blackie, & Co., and which became the foundation of Mr. Bell's *System of Popular and Scientific Geography*. In 1824 he published—in conjunction with a young Glasgow linguist of great promise, named John Bell, who died January 1, 1826, but no relative of the subject of this memoir—a thin 8vo volume, entitled *Critical Researches in Philology and Geography*. The philologist contributed two articles to the volume, the one a "Review of Jones' Grammar," and the other a "Review of an Arabic Vocabulary and Index to Richardson's Arabic Grammar, by James Noble, Teacher of Languages, in Edinburgh," both of which are characterized by a minute acquaintance with the subjects under discussion. The geographer's

contribution consisted of a very elaborate "Examination of the Various Opinions that in Modern Times have been held respecting the Sources of the Ganges, and the Correctness of the Lamas' Map of Thibet," which elicited high encomiums from some of the leading periodicals of the day.

Geography was the science around which as a nucleus all his sympathies gathered, as if by an involuntary and irresistible tendency. To it he consecrated the labour of his life; it was the favourite study of his earlier years, and his old age continued to be cheered by it. In everything belonging to this science there was a marvellous quickness and accuracy of perception—an extreme justness of observation and inference about him. When the conversation turned upon any geographical subject, his ideas assumed a kind of poetical inspiration, and flowed on in such unbroken and close succession, as to leave no opportunity to his auditors of interposing a question or pursuing a discussion. Once engaged, there was no recalling him from his wild excursive range—on he went, revelling in the intensity of his own enjoyment, and bearing his hearers along with him over chains of mountains and lines of rivers, until they became utterly bewildered by the rapidity with which the physical features of every region of the globe were made to pass in panoramic succession before them.

From his childhood Mr. Bell had been subject to severe attacks of asthma. These gradually assumed a more alarming character, and ultimately compelled him to leave Glasgow for a residence in the country. The place which he selected for his retirement was a humble cottage in the neighbourhood of the village of Campsie, about twelve miles north of Glasgow. Here he spent the last ten or twelve years of his life in much domestic comfort and tranquillity.

He was abstemious in his general habits; and his only earthly regret—at least the only one which he deemed of sufficient consequence to make matter of conversation—was the smallness of his library, and his want of access to books. Yet it is astonishing how little in the republic either of letters or of science he allowed to escape him. His memory was so retentive, that nothing which he had once read was ever forgotten by him. This extraordinary faculty enabled him to execute his literary commissions with a much more limited apparatus of books, than to others less gifted would have been an indispensable requisite.

The closing scene of Mr. Bell's life was calm and peaceful. He had, as already mentioned, long suffered violently from asthma. This painful disease gradually gained upon his constitution, and became more severe in its periodical attacks, and the exhausted powers of nature finally sank in the struggle. He expired on the 3d of May, 1833, in the sixty-fourth year of his age, and was buried, at his own express desire, in the old churchyard of Campsie—a beautiful and sequestered spot.

In forming an estimate of Mr. Bell's literary character, we must always keep in view the difficulties with which he had to struggle in his unwearied pursuit of knowledge. He was without fortune, without powerful friends, and destitute, to a great extent, of even the common apparatus of a scholar. He laboured also under defects of physical organization which would have chilled and utterly repressed any mind less ardent and enthusiastic than his own in the pursuit of knowledge: yet he surmounted every obstacle, and gained for himself a distinguished place among British geographers, in despite both of his hard fortune and infirm health. Many men have made a more brilliant display with inferior talents and fewer accomplishments; but none ever possessed

a more complete mastery over their favourite science, and could bring to any related task a greater amount of accurate and varied knowledge. That he was an accomplished classical scholar is apparent from the immense mass of erudite allusions which his writings present; but he was not an exact scholar. He knew little of the niceties of language; his compositions are often inelegant and incorrect; he had no idea of elaborating the expression of his thoughts, but wrote altogether without attention to effect, and as if there were no such things as order in thinking and method in composition. It would be doing him injustice, however, while on this point, not to allow that his later writings exhibit a closer connection of ideas, and greater succinctness of mental habits than his earlier productions.

Besides the earlier publications already adverted to, Mr. Bell edited an edition of *Rollin's Ancient History* including the volume on the "Arts and Sciences of the Ancients." This work, published in Glasgow, in three closely printed octavo volumes, bears ample evidence to the industry, research, and sagacity of the editor. The notes are of great extent, and many of them, on the geography of the ancients, on the bearing of history on prophecy, more particularly the prophecies of Daniel, or such notes as those on the retreat of the ten thousand Greeks, the march of Hannibal across the Alps, and the ruins of Babylon, amount to discussions of considerable length.

His other great work was his *System of Geography*, of which it is sufficient to say, that it has been pronounced decidedly superior as a popular work to that of Malte Brun, and on this account was subsequently republished in America. In this country it obtained a very extensive circulation. The preparation of these works, and of materials left incomplete for a *General Gazetteer*, occupied a great many years of Mr. Bell's life. He also took a lively interest in the success of several scientific periodicals, and aided their progress by numerous valuable contributions from his own pen. In all his writings, from the causes already assigned, there is too little effort at analysis and compression. Much might with advantage have been abridged, and much pared off. In his *System of Geography*, he occasionally borrowed the correcting pen of a friend, hence its composition is more regulated and chastened.

Mr. Bell's moral character was unimpeachable. He was remarkable for plain, undissembling honesty, and the strictest regard to truth. In all that constituted practical independence of character, he was well furnished; he could neither brook dependence nor stoop to complaint. He was in the strictest sense of the word a pious man. He concurred with his whole heart in that interpretation of the doctrines of the Bible commonly called the Calvinistic; but in no sense of the word was he sectarian in spirit; he had no bigotry or intolerance of opinion on religious points, although few could wield the massive weapons of theological controversy with greater vigour and effect.

BELL, JOHN, of Antermony, a traveller of the eighteenth century, was the son of Patrick Bell, the representative of that old and respectable family, and of Anabel Stirling, daughter of Mungo Stirling of Craigharnet. He was born in 1691, and, after receiving a classical education, turned his attention to the study of medicine. On passing as physician, he determined to visit foreign countries, but we shall insert this part of his history in Mr. Bell's own words. "In my youth," says he, "I had a strong desire of seeing foreign parts; to satisfy which inclination, after having obtained, from some persons of worth,

recommendatory letters to Dr. Areskine, chief physician and privy counsellor to the Czar Peter I., I embarked at London, in the month of July, 1714, on board the *Prosperity* of Ramsgate, Captain Emerson, for St. Petersburg. On my arrival there, I was received by Dr. Areskine in a very friendly manner, to whom I communicated my intentions of seeking an opportunity of visiting some parts of Asia, at least those parts which border on Russia. Such an opportunity soon presented itself, on occasion of an embassy then preparing from his czarish majesty to the Sophy of Persia."—(*Preface to his Travels*.) The ambassador fortunately applied to Dr. Areskine to recommend some one skilled in physic and surgery to go in his suite, and Mr. Bell was soon afterwards engaged in the service of the Russian emperor. He accordingly left St. Petersburg on the 15th of July, 1715, and proceeded to Moscow, from thence to Casan, and down the Volga to Astracan. The embassy then sailed down the Caspian Sea to Derbend, and journeyed by Mougan, Tauris, and Saba, to Ispahan, where they arrived on the 14th of March, 1717. They left that city on the 1st of September, and returned to St. Petersburg on the 30th December, 1718, after having travelled across the country from Saratoff. On his arrival in the capital, Mr. Bell found that his friend and patron Dr. Areskine had died about six weeks before, but he had now secured the friendship of the ambassador, and upon hearing that an embassy to China was preparing, he easily obtained an appointment in it through his influence. The account of his journey to Casan, and through Siberia to China, is by far the most complete and interesting part of his travels. His description of the manners, customs, and superstitions of the inhabitants, and of the Delay-lama and Chinese wall, deserve particularly to be noticed. They arrived at Pekin "after a tedious journey of exactly sixteen months." Mr. Bell has left a very full account of occurrences during his residence in the capital of China. The embassy left that city on the 2d of March, 1721, and arrived at Moscow on the 5th of January, 1722.

The war between Russia and Sweden was now concluded, and the czar had determined to undertake an expedition into Persia, at the request of the sophy, to assist that prince against the Affighans, his subjects, who had seized upon Kandahar, and possessed themselves of several provinces on the frontiers towards India. Mr. Bell's former journey to Persia gave him peculiar advantages, and he was accordingly engaged to accompany the army to Derbent, from which he returned in December, 1722. Soon afterwards he revisited his native country, and returned to St. Petersburg in 1734. In 1737 he was sent to Constantinople by the Russian chancellor, and Mr. Rondeau the British minister at the Russian court.¹ He seems now to have abandoned the public service, and to have settled at Constantinople as a merchant. About 1746 he married Mary Peters, a Russian lady, and determined to return to Scotland. He spent the latter part of his life on his estate, and in the enjoyment of the society of his friends. At length, after a long life spent in active beneficence, and exertions for the good of mankind, he died at Antermomy on the 1st of July, 1780, at the advanced age of eighty-nine.

The only work written by Mr. Bell is his *Travels from St. Petersburg in Russia to various parts of Asia*, to which reference has already been made. It was printed in 2 volumes quarto by Robert and Andrew Foulis, in 1763, and published by subscrip-

tion. "The history of this book," says the *Quarterly Review*, "is somewhat curious, and not generally known. For many years after Mr. Bell returned from his travels, he used to amuse his friends with accounts of what he had seen, refreshing his recollection from a simple diary of occurrences and observations. The Earl Granville, then president of the council, on hearing some of his adventures, prevailed on him to throw his notes together into the form of a narrative, which, when done, pleased him so much that he sent the manuscript to Dr. Robertson, with a particular request that he would revise and put it into a fit state for the press. The literary avocations of the Scottish historian at that time not allowing him to undertake the task, he recommended Mr. Barron, a professor in the university of Aberdeen, and on this gentleman consulting Dr. Robertson as to the style and the book of travels which he would recommend him to adopt for his guide, the historian replied, 'Take *Gulliver's Travels* for your model, and you cannot go wrong.' He did so, and '*Bell's Travels*' have all the simplicity of Gulliver, with the advantage which truth always carries over fiction."²

BELL, JOHN, an eminent surgeon in Edinburgh, and of distinguished literary qualifications, was born in 1762. He was the second son of the Rev. William Bell, a clergyman of the Scottish Episcopal Church, established at Edinburgh. His mother was the daughter of Mr. Morrice, also a member of the Scottish Episcopal Church. Mr. John Bell, after receiving a liberal education, became the pupil of Mr. Alexander Wood, surgeon, who was long celebrated in Edinburgh as a medical practitioner. From the first, Mr. Bell devoted himself to his professional studies with that enthusiastic ardour so characteristic of genius, and almost always the precursor of distinction. After completing his professional education, he travelled for a short time in Russia and the north of Europe; and on his return commenced his professional duties by delivering lectures on surgery and midwifery. These lectures, which he delivered between the years 1786 and 1796, were very highly esteemed, and speedily brought him into practice as a consulting and operating surgeon. The increase of his private practice, indeed, rendered it necessary for him, in 1796, to discontinue his lectures, and from that time forward he devoted himself to his patients, and to the preparation of his several publications.

For upwards of twenty years Mr. Bell may be said to have stood at the head of his profession in Edinburgh as an operator. Patients came to him from all quarters, both of Scotland and England, and even from the Continent, and during that interval he performed some of the most delicate and difficult operations in surgery. Nor was his celebrity confined to Edinburgh. He was generally known, both in this country and throughout the world, as one of the most distinguished men in his profession; and his works show that his reputation was well founded.

Early in 1816 he was thrown by a spirited horse, and appears never to have entirely recovered from the effects of the accident. In the autumn of that year he made an excursion, partly on account of his health, to London; thence he proceeded to Paris, and afterwards pursued his journey southwards, visiting the most distinguished cities of Italy. During his residence on the Continent, he was treated in the most flattering manner by the members of his own science; and his countrymen, who, after the peace

¹ M'Ure's *History of Glasgow*, new edition, p. 115.

² *Quarterly Review* on M'Leod's *Voyage in the Alceste*, 1817, p. 464-65.

of 1815, had gone to the Continent in great numbers, gladly took his surgical assistance. In Paris, Naples, and Rome in particular, his numerous patients occupied him perhaps too exclusively; for his health continued to decline, and he died at Rome, April 15, 1820, in the fifty-seventh year of his age.

Mr. Bell very early in life became impressed with a high notion of the advantage of combining general accomplishments with professional skill; he therefore spared no pains to qualify himself in every way to assume a favourable position in society. He was a good classical scholar, and so general a reader that there were few works of any note in literature, either ancient or modern, with which he was not familiar. This was remarkably shown in his library, in which there was hardly a volume on any subject which did not bear traces of having been carefully perused and noted by him. His practice was to make annotations on the margin as he read; and considering the engrossing nature of his professional labours, and the several works in which he was himself engaged, nothing is more extraordinary than the evidence which is still in existence of the extent and variety of his miscellaneous reading.

The information which he thus acquired was not lost upon him; he was polished and easy in his manners, his perception of the ludicrous was keen, and the tact with which he availed himself of his extensive reading and general knowledge of all the interesting topics of the day will be long remembered by those who had the pleasure of his acquaintance. His conversational powers, indeed, were of the very highest order; and as he had great urbanity and kindness of manner, and was happily free from that affectation by which good talkers are sometimes distinguished, there were few of his contemporaries whose society was more generally courted by the upper classes in Edinburgh, and none who were better fitted to adorn and enliven the circle in which he moved.

Mr. Bell's notions of the dignity of his profession were very high, and no man perhaps ever discharged his professional duties with more disinterested humanity and honourable independence. His generosity to those whose circumstances required pecuniary aid was well known, and his contempt for anything approaching to what he thought mean or narrow-minded was boundless, and frequently expressed in no very measured terms. The warmth of his temper, however, involved him in several misunderstandings with his professional brethren; the most remarkable of which was that which brought him and Dr. Gregory into collision. The question on which these two distinguished men took opposite sides related to the right of the junior members of the College of Surgeons of Edinburgh to perform operations in the Royal Infirmary. This dispute divided the medical men of Edinburgh towards the close of the last century; and Dr. Gregory and Mr. Bell wrote several volumes about it. But, although great wit and much happy sarcasm were displayed on both sides, it is impossible to look back to this discussion without feeling regret that two of the most eminent medical men of their day should have wasted their ingenuity and high talents in acrimonious and unprofitable controversy, on a topic of ephemeral interest and comparatively minor importance. Mr. Bell's principal publication in this controversy was entitled *Letters on Professional Character and Manners; on the Education of a Surgeon, and the Duties and Qualifications of a Physician; addressed to James Gregory, M.D. Edinburgh, 1810*. It is a large octavo volume, and is characterized by extraordinary acrimony.

In the fine arts, Mr. Bell's taste was very correct. As a painter and draughtsman his talents were far above mediocrity; and the anatomical drawings by which his works are illustrated have been much admired. He was also a proficient in music, with more taste, however, than execution; and as Mrs. Bell was also a highly accomplished musician, his musical parties, although conducted on a scale of expense which his circumstances hardly warranted, assembled at his house the *élite* of Edinburgh society. He had no family, and his whole house was laid out for this species of display—a *foible* which those who were inclined to laugh at his expense did not overlook, and which was to a certain extent censurable, since his income, although very large, was never equal to his expenditure.

Mr. Bell's personal appearance was good. Although considerably under the middle size, he was exceedingly well proportioned, very active and studiously elegant in his movements. His head was well formed, his features regular, his eyes keen and penetrating, and his whole expression intellectual and intelligent in no ordinary degree. He was also remarkable for the good taste which he exhibited in his dress; and was altogether a person whom even a stranger could not have passed without recognizing as no ordinary man.

The limits of this work do not admit of an analysis of Mr. Bell's writings. The best is his treatise on *Gunshot Wounds*, to enable him to prepare which he passed some weeks amongst the wounded men of Lord Duncan's fleet, after the battle of Camperdown.

The following is a complete list of his professional works:—1. *The Anatomy of the Human Body*, vol. i. 8vo, 1793, containing the *Bones, Muscles, and Joints*; vol. ii. 1797, containing the *Heart and Arteries*; vol. iii. 1802, containing the *Anatomy of the Brain, Description of the Course of the Nerves, and the Anatomy of the Eye and Ear; with Plates by Charles Bell*, third edition, 3 vols. 8vo, 1811. 2. *Engravings of the Bones, Muscles, and Joints*, illustrating the first volume of the *Anatomy of the Human Body*, drawn and engraved by himself, royal 4to, 1794, third edition. 3. *Engravings of the Arteries*, illustrating the second volume of the *Anatomy of the Human Body*, royal 4to, 1801; third edition, 8vo, 1810. 4. *Discourses on the Nature and Cure of Wounds*, 8vo, 1795; third edition, 1812. 5. *An answer for the Junior Members of the Royal College of Surgeons to the Memorial of Dr. James Gregory, to the Managers of the Royal Infirmary*, 8vo, 1800. 6. *The Principles of Surgery*, 3 vols. 4to, 1801-1808. 7. *Letters on Professional Character, &c.* His *Observations on Italy* is a posthumous work, which was edited by his respected friend Bishop Sandford of Edinburgh.

Mr. Bell married Miss Congleton, daughter of Dr. Congleton of Edinburgh. His eldest brother was Robert Bell, advocate, professor of conveying to the Society of Writers to the Signet; author of the *Scottish Law Dictionary*, and of several other works on the law of Scotland; who died in 1816. John Bell's immediately younger brothers were, George Joseph Bell, advocate, professor of the law of Scotland in the university of Edinburgh, and author of *Commentaries on the Law of Scotland*, a work of high authority; and Sir Charles Bell, F.R.S. of London, the distinguished anatomist and physiologist. It is rare to find so many members of the same family so favourably known to the public.

BELLENDEN, WILLIAM, more commonly known by his Latin name of Gulielmus Bellendenus, is one

of those Scotsmen of a former age, who are esteemed in the general literary world as an honour to their country, but with whom that country itself is scarcely at all acquainted. As there were many great but unrecorded heroes before Agamemnon, so may it be said that there have flourished, *out of Scotland*, many illustrious Scotsmen, whose names have not been celebrated in that country. It is time, however, that this should cease to be the case, at least in reference to William Belinden, whose intellect appears to have been one of most extraordinary character, and whose intellectual efforts, if in a shape to command more extensive appreciation, would certainly be considered a great addition to those productions which reflect honour upon his native country.

William Belinden was unquestionably a member of that family whose name has been variously spelled Ballenden, Ballantyn, and latterly Ballantyne, and which has produced several men eminent in Scottish literature. He lived in the reign of James VI., to whom he was *Magister Supplicum Libellorum*, or reader of private petitions, an office probably conferred upon him in consideration of his eminent learning. King James, whose many regal faults were in some measure redeemed by his love of literature and patronage of literary men, provided Belinden with the means of leading a life of studious retirement at the French capital, where he is said to have afterwards become professor of humanity, and an advocate in the parliament of Paris.

Belinden's first work, entitled *Ciceronis Princeps*, and published, apparently without his name, in 1608, is a treatise on the duties of a prince, formed out of passages of the works of Cicero referring to that subject. To the *Ciceronis Princeps*, in which Belinden has only the merit of an ingenious collector, was prefixed an original essay, styled *Tractatus de Processu et Scripturis Rei Politicæ*, in which there is a rich vein of masculine sense and fervent piety, while the origin of our errors in religion, and of our defects in policy and learning, is traced out with considerable accuracy and erudition. In this treatise, the author, while he condemns the monstrous tenets of ancient idolatry, and the gross corruptions of philosophy, bestows many just encomiums on the wisdom and patriotism of some ancient legislators.

Belinden next published a treatise, formed like the foregoing from detached passages in Cicero, regarding the duties of the consul, senator, and senate among the Romans. It was entitled *Ciceronis Consul, Senator, Populusque Romanus: illustratus publici observatione juris, gravissimi usus disciplina, administrandi temperata ratione: notatis inclinationibus temporum in Rep. et actis rerum in Senatu: quæ a Ciceroniana nondum edita profluxere memoria, annumerum DCCX. congesta in libros xvi. De statu rerum Romanorum unde jam manavit Ciceronis Princeps, dignus habitus summorum lectione principum*. Belinden has here shown, not only the duties of a senator or statesman, but upon what basis the rights of a free but jealous people are erected, and the hallowed care those institutions demand which have descended to us from our ancestors. This work was published at Paris in 1612, and, like the former, was dedicated to Henry, Prince of Wales. On the title-page the author is termed "*Magister Supplicum Libellorum augusti Regis Magnæ Britanniæ*," from which it would appear that either there is a mistake in describing him as master of requests to the King of Scotland, or he must have been subsequently preferred to the same office for Great Britain. The office, since he resided at Paris, must have been a sinecure, and was probably given to him as a means of sustaining him in literary leisure.

The next work of Belinden was entitled *De Statu Prisci Orbis, in Religione, Re Politica, et Literis, liber unus*. It was printed, but may scarcely be described as published, in 1615. This is the most original of Belinden's works. The expressions and sentiments are all his own, excepting the quotations which he takes occasion to introduce from his favourite Cicero. In this work he has "brought to light, from the most remote antiquity, many facts which had been buried in oblivion. Whatever relates to the discipline of the Persians and Egyptians, which was obscure in itself, and very variously dispersed, he has carefully collected, placed in one uniform point of view, and polished with diligent acuteness. In a manner the most plain and satisfactory, he has described the first origin of states, their progressive political advances, and how they differed from each other. Those fabulous inventions with which Greece has encumbered history, he explains and refutes. Philosophy owes him much. He has confuted all those systems which were wild and extravagant, and removed the difficulties from such as were in their operation subservient to religious piety. But he has in particular confirmed and dignified, with every assistance of solid argument, whatever tended to serve the great truths of revelation. Much, however, as he has been involved in the gloom of ancient times, he in no one instance assumes the character of a cold unfeeling antiquary; he never employs his talents upon those intricate and useless questions, in endeavouring to explain which many huckless and idle theologians torment themselves and lose their labour. The style of Belinden, in this performance, is perspicuous, and elegant without affectation. The different parts of the work are so well and so judiciously disposed, that we meet with nothing harsh and dissonant, no awkward interval or interruption, nothing placed where it ought not to remain."¹

All these three works—namely, the *Princeps*, the *Consul*, and the *De Statu Prisci Orbis*—were republished in 1616 in a united form, under the general title *De Statu, Libri Tres*. Prince Henry being now dead, the whole work was dedicated anew to his surviving brother Charles; a circumstance which afforded the author an opportunity of paying an ingenious compliment to the latter prince:

— "Uno avulso non deficit alter,
Aureus, et simili frondescit virga metallo."

Of the justness of this eulogy the politician may have some doubt, but the man of feeling will be captivated by its elegance and pathos.

The last work which Belinden himself published is of very small extent, consisting merely of two short poems: *Caroli Primi et Henricæ Mariæ, Regis et Reginæ Magnæ Britanniæ, &c. Epithalamium; et in ipsas augustissimas nuptias, Pægyricum Carmen et Elegia*. Paris, 1675, 4to. It would appear that Belinden did not soon forget the kind patronage which he had experienced from King James, but transferred his gratitude, with his loyalty, to the descendants of that prince. This is the only known specimen of Belinden's efforts in poetry.

The *De Statu, Libri Tres*, which perhaps were never very extensively diffused, had latterly become so extremely scarce, as only to be known by name to the most of scholars. From this obscurity the work was rescued in 1787, by Dr. Samuel Parr, the most eminent British Latinist of modern times. Dr. Parr republished it in an elegant form, with a preface, which, though embracing a singular jumble of subjects, and not free from the charge of pedantry, is

¹ Parr's Preface.

justly looked upon as one of the most admirable specimens of modern Latin which we possess. Imitating the example of Bellegenden, who prefixed a dedication to each of his three books, the learned editor inscribed them anew to three great men of modern times, Edward Burke, Lord North, and Charles James Fox, who were then the leaders of his own party in British politics. In the preface he introduced a high allegorical eulogy upon these statesmen, which was admired as a singularly nervous piece of composition, though there were, of course, different opinions as to the justness of the panegyric. He also exposed the plagiarist which Middleton, in composing his *Life of Cicero*, had committed upon the splendid stores of Bellegenden.

While Bellegenden was employed in writing his tripartite work, *De Statu*, he had Cicero constantly before him. "His warmest attachment, and increasing admiration," to quote the words of Dr. Parr, "were necessarily attracted to the character whose writings were the object of his unremitting attention; whose expressions were as familiar to him as possible; and whose various and profound learning occupied all the faculties of his soul." He now commenced a still more extensive and laborious cento of the writings of the Roman orator, which he concluded in sixteen books, and which, with the addition of similar centoes of the writings of Seneca and Pliny the Elder, was to bear the name, *De Tribus Luminibus Romanorum*. The Ciceronian cento, the only one he lived to complete, is justly considered a most extraordinary performance. By an exertion of fictitious machinery, akin to the modern historical romance, Cicero is introduced as if he had spoken or written the whole from beginning to end. The first seven books give a very concise abstract of the Roman history, from the foundation of the city to the 647th year, in which he was born. Then he becomes more particular in the account of his own times, and enlarges very fully on all that happened after his first appearance in public business. He gives an account of the most remarkable of his orations and epistles, and the occasions on which they were written, as also of such of his philosophical works as have come down to us, and of some other pieces that are now lost, ending with a letter he is supposed to have written to Octavianus, afterwards named Augustus, which letter, however, is supposed to be spurious. There cannot be a more complete history of the life of Cicero, or of the tumultuous times in which he lived, than this work, all of which, by an exquisite ingenuity, is so faithfully compiled from the known works of the orator, that probably there is not in the whole book a single expression, perhaps not a single word, which is not to be found in that great storehouse of philosophical eloquence. Nor is there any incoherence or awkwardness in this re-arrangement of Cicero's language; but, on the contrary, the matter flows as gracefully as in the original. "Whatever we find," says Parr, "in the different writings of Cicero, elegantly expressed, or acutely conceived, Bellegenden has not only collected in one view, but elucidated in the clearest manner. He, therefore, who peruses this performance with the attention which it merits, will possess all the treasures of antiquity, all the energy of the mightiest examples. He will obtain an adequate knowledge of the Roman law and system of jurisprudence, and may draw, as from an inexhaustible source, an abundance of expressions, the most exquisite in their kind." In the opinion of another critic,¹ it is inconceivable that Bellegenden could have

composed this singular work without having the whole of the writings of Cicero, and all the collateral authorities, in his mind at once, as it must have been quite impossible to perform such a task by turning over the leaves of the books, in order to find the different expressions suited to the various occasions where they were required.

After the death of Bellegenden, the date of which is only known to have been posterior to 1625, the manuscript of his great work fell into the hands of one Toussaint du Bray, who printed it at Paris in 1631 or 1634, and dedicated it to King Charles I. of Great Britain. It is alleged that the principal part of the impression, about a thousand copies, was shipped for sale in Britain, and was lost on the passage, so that only a few copies survived. The work therefore fell at once into obscurity, and in a few years was scarcely known to exist. One copy having found its way to the Cambridge University Library, fell into the hands of Conyers Middleton, the keeper of that institution, who seems to have adopted the idea of making it the groundwork for a life of Cicero under his own name. Hence has arisen one of the most monstrous instances of literary *plagium* which modern times have witnessed. The work of Middleton at once attained to great reputation, and chiefly through that skillful arrangement of the writings of the orator himself which Bellegenden had provided to his hands. The theft was first denounced by Warton, and subsequently made clear by Dr. Parr in his preface to the *De Statu*.

It is impossible to dismiss the life and singular writings of William Bellegenden, without a passing expression of regret, that so much ingenuity, so much learning, so much labour, may be expended, without producing even the remuneration of a name — for Bellegenden, to use a phrase of Buchanan, is a *light* rather than a *name*. His last work extended to 824 pages in folio, and he contemplated other two of similar size, and equal labour. Yet all this was so futile, that the very next generation of his own countrymen do not appear to have known that such a man ever existed. Even after all the care of bibliographers and others, which has searched out the few facts embraced by this imperfect narrative, the name of Bellegenden is only known in connection with certain works, which are, it is true, *reputed* to be admirable of their kind, but, for every practical purpose, are almost as entirely lost to the world at large, as those *libri perditii* of Cicero, which he has himself alluded to with so much regret.

BERNARD, made abbot of Aberbrothock in 1303, and the first chancellor of King Robert Bruce, after his assumption of the crown in 1306, deserves a place in this work, as the supposed writer of that spirited remonstrance which the Scottish nobility and barons transmitted, in 1318, to the Roman pontiff, asserting the independency of their country. He held the great seal till his death in 1327. Crawford supposes that his surname was Linton.

BERRY, WILLIAM, an ingenious artist, was born about the year 1730, and bred to the business of a seal-engraver. After serving an apprenticeship under a Mr. Proctor at Edinburgh, he commenced business for himself in that city, and soon became distinguished for the elegance of his designs, and the clearness and sharpness of his mode of cutting. At this time the business of a stone-engraver in the Scottish capital was confined to the cutting of ordinary seals, and the most elaborate work of this kind to engraving the armorial bearings of the nobility. Mr. Berry's views were for several years confined to this common

¹ The late Earl of Buchan, who had the extraordinary fortune to possess a copy of this rare book.

drudgery of his art; but, by studying some ancient entaglios, he at length ventured into that higher walk which bears the same relation to seal-engraving that historical painting does to portrait-painting. The subject he chose for his first essay was a head of Sir Isaac Newton, which he executed with such precision and delicacy, as astonished all who had an opportunity of observing it. The modesty of Mr. Berry permitted him to consign this gem to the hands of a friend in a retired situation of life, who had few opportunities of showing it to others. He resumed his wonted drudgery, and for many years "narrowed his mind" to the cutting of heraldic seals, while in reality he must have known that his genius fitted him for a competition with the highest triumphs of Italian art. When he was occasionally asked to undertake somewhat finer work, he generally found that, though he only demanded perhaps half the money which he could have earned in humbler engraving during the same space of time, yet even that was grudged by his employers; and he therefore found that mere considerations of worldly prudence demanded his almost exclusive attention to the ordinary walk of his profession. Nevertheless, in the course of a few years, the impulse of genius so far overcame his scruples, that he executed various heads, any one of which would have been sufficient to insure him fame among judges of excellence in this department of art. Among these were heads of Thomson, author of *The Seasons*, Mary Queen of Scots, Oliver Cromwell, Julius Cæsar, a young Hercules, and Mr. Hamilton of Bangour, the well-known poet. Of these only two were copies from the antique; and they were executed in the finest style of those celebrated entaglios. The young Hercules, in particular, possessed an unaffected plain simplicity, a union of youthful innocence with strength and dignity, which struck every beholder as most appropriate to that mythological personage, while it was, at the same time, the most difficult of all expressions to be hit off by the faithful imitator of nature. Berry possessed this perceptive faculty to a degree which almost proved an obstruction, rather than a help, in his professional career. In his best performances he himself remarked defects which no one else perceived, and which he believed might have been overcome by greater exertion, if for that greater exertion he could have spared the necessary time. Thus, while others applauded his entaglios, he looked upon them with a morbid feeling of vexation, arising from the sense of that struggle which his immediate personal wants constantly maintained with the nobler impulses of art, and to which his situation in the world promised no speedy cessation. This gave him an aversion to the higher department of his art, which, though indulged in his own temporary comfort and the advantage of his family, was most unfortunate for the world.

In spite of every disadvantage, the works of Mr. Berry, few as they were in number, became gradually known in society at large; and some of his pieces were even brought into competition, by some distinguished cognoscenti, with those of Picler at Rome, who had hitherto been the unapproached sovereign of this department of the arts. Although the experience of Picler was that of a constant practitioner, while Mr. Berry had only attempted a few pieces at long intervals in the course of a laborious life; although the former lived in a country where every artificial object was attuned to the principles of art, while Mr. Berry was reared in a soil remarkable for the absence of all such advantages; the latter was by many good judges placed above his Italian contemporary. The respective works of the

two artists were well known to each other; and each declared, with that manly ingenuousness which very high genius alone can confer on the human mind, that the other was greatly his superior.

Mr. Berry possessed not merely the art of imitating busts or figures set before him, in which he could observe and copy the prominence or depression of the parts; but he possessed a faculty which presupposes a much nicer discrimination—that of being able to execute a figure in *relievo*, with perfect justness in all its parts, which was copied from a painting or drawing upon a flat surface. This was fairly put to the test in the head he executed of Hamilton of Bangour. That gentleman had been dead several years, when his relations wished to have a head of him executed by Berry. The artist had himself never seen Mr. Hamilton, and there remained no picture of him but an imperfect sketch, which was by no means a striking likeness. This was put into the hands of Mr. Berry by a person who had known the deceased poet, and who pointed out the defects of the resemblance in the best way that words can be made to correct things of this nature; and from this picture, with the ideas that Mr. Berry had imbibed from the corrections, he made a head which everyone who knew Mr. Hamilton allowed to be one of the most perfect likenesses that could be wished for. In this, as in all his works, there was a correctness in the outline, and a truth and delicacy in the expression of the features, highly emulous of the best antiques; which were, indeed, the models on which he formed his taste.

The whole number of heads executed by Mr. Berry did not exceed a dozen; but, beside these, he executed some full-length figures of both men and animals, in his customary style of elegance. His attention, however, to the interests of a numerous family made him forego those agreeable exertions, for the more lucrative though less pleasing employment of cutting heraldic seals, which formed his constant employment for forty years together. In this department he was, without dispute, the first artist of his time; but even here his modesty, and that invariable desire of giving perfection to everything he put out of his hand, prevented him from drawing such emoluments from his labours as they deserved. Of this the following anecdote will serve as an illustration, and as an additional testimony of his very great skill. Henry, Duke of Bucleuch, on succeeding to his title and estates, was desirous of having a seal cut, with his arms properly blazoned upon it. But, as there were no fewer than thirty-two compartments in the shield, which was of necessity confined to a very small space, so as to leave room for the supporters and other ornaments, within the compass of a seal of ordinary size, he found it a matter of great difficulty to get it executed. Though a native of Scotland himself, the noble duke had no idea that there was a man of first-rate eminence in this art in Edinburgh; and accordingly he had applied to the best seal-engravers in London and Paris, all of whom declared it to be beyond their skill. At this time Berry was mentioned to him with such powerful recommendations that he was induced to pay him a visit, and found him, as usual, seated at his wheel. The gentleman who had mentioned Mr. Berry's name to the duke accompanied him on his visit. This person, without introducing the duke, showed Mr. Berry the impression of a shield which the duchess-dowager had got cut a good many years before by a Jew in London, now dead, and which had been shown to others as a pattern; asking him if he would cut a seal the same as that. After examining it a little, Mr. Berry answered readily

that he would. The duke, at once pleased and astonished, exclaimed, "Will you, indeed!" Mr. Berry, who thought that this implied some doubt of his ability to perform what he undertook, was a little piqued, and turning round to the duke, whom he had never before seen, he said, "Yes, sir; if I do not make a better seal than this, I will charge no payment for it." The duke, highly pleased, left the pattern with Mr. Berry, and went away. The original contained, indeed, the various devices of the thirty-two compartments distinctly enough to be seen; but none of the colours were expressed. Mr. Berry, in proper time, finished the seal; on which the figures were not only done with superior elegance, but the colours on every part so distinctly marked that a painter could delineate the whole, or a herald blazon it, with perfect accuracy. For this extraordinary and most ingenious labour he charged no more than thirty-two guineas, though the pattern seal had cost seventy-five. Thus it was, that, though possessed of talents unequalled in their kind, at least in Britain, and assiduity not to be surpassed—observing at the same time the strictest economy in his domestic arrangements—Mr. Berry died at last, in circumstances far from affluent, June 3, 1783, in the fifty-third year of his age, leaving a numerous family of children. It had been the lot of this ingenious man to toil unceasingly for a whole life, without obtaining any other reward than the common boon of mere subsistence, while his abilities, in another sphere, or in an age more qualified to appreciate and employ them, might have enabled him to attain at once to fame and fortune in a very few years. His art, it may be remarked, has made no particular progress in Scotland in consequence of his example. The genius of Berry was solitary, both in respect of place and time, and has never been rivalled by any other of his countrymen. It must be recorded, to the honour of this unrequited genius, that his character in private life was as amiable and unassuming as his talents were great; and that his conduct on all occasions was ruled by the strictest principles of honour and integrity.

BETHUNE, ALEXANDER. This man, and his younger brother John, were choice specimens of that intellectual class of Scottish peasantry in which our country happily abounds, and of which it is so justly proud. Alexander, the subject of the present notice, was born at Upper Rankellor, in the parish of Monimail, in July 1804. Such was the extreme domestic poverty in which he was reared, that he could not even obtain the ordinary share of a Scottish peasant's education; his whole portion in this respect being four or five months' attendance at a subscription school, when he was in his sixth year. But his mother was a remarkable woman, and it was from her that the two brothers mainly derived their education, as well as their energetic intellectual character. At the raw age of fourteen he was set to break stones on the highway, a strong man's occupation, by which his tender bones and muscles were sorely tried; and at the age of twenty-one he was enabled, from the savings of his scanty pay, to enrol himself in the evening classes of a school at the hamlet of Lochend, near Lindores. Naturally desirous of emerging from his uncomfortable position, he betook himself to weaving with his brother John, but scarcely had they managed to procure the necessary apparatus, when the mercantile depression of 1825 and 1826 compelled them to abandon their hopes of the loom, and take occupation as out-door labourers at the wages of a shilling a-day. Thus employed in such chance toil as he could obtain, Alexander, in

1829, while employed in a quarry, was thrown into the air by a blast of gunpowder, and so dreadfully mangled that his recovery was thought hopeless. Three years after a disaster of the same character befell him, but still more severe, by which he was frightfully disfigured, and the effects of which he felt till the end of his days.

Such a scanty education, and subsequent life of hardship and penury, were little calculated to foster the cultivation of literature; but Alexander Bethune was no ordinary character; and those difficulties which in others would have extinguished such ambition, only confirmed his resolution, and strengthened him for the work. Accordingly, while breaking stones on the highway, or blasting huge masses in the quarry, he had never failed at every interval to enlarge his knowledge by reading, and develop his intellectual faculties by composition. In 1835 several of his productions appeared in *Chambers' Edinburgh Journal*, and in 1838 he completed and published a series of *Tales and Sketches of the Scottish Peasantry*, part of which work was written by his brother John. After several struggles and changes, which will fall to be mentioned in the memoir of the latter, the two brothers fenced a small piece of ground near Newburgh, and built there a cottage chiefly with their own hands. Here also they prepared and published their joint work, entitled *Lectures on Practical Economy*, which was issued from the press in 1839. After the death of John, during the same year, Alexander made a collection of his brother's poems, and published them in 1840, with an interesting memoir of the author. A copy of this work having fallen into the hands of Mrs. Hill, wife of Mr. Frederick Hill, inspector of prisons, that lady wrote to Alexander Bethune, offering to use her interest in procuring him a situation either as a teacher, or in some way connected with the prisons. It was a tempting offer to one in his situation, and Alexander so far complied with it as to try the office of a turnkey in the prison at Glasgow. But a week's experience sufficed him, and in March, 1841, he wrote a grateful answer to the lady, respectfully declining her offer, and stating that he did not wish an application to be made for one who had no qualifications above those of a common labourer.

In 1842 Alexander Bethune visited Edinburgh to make arrangements for the publication of *The Scottish Peasant's Fireside*, which appeared early in the following year. But this was the last of his intellectual efforts, and his life of struggle was drawing to a close. He had previously been attacked by fever, and although the disease had been partially cured, it had settled down into the more dangerous form of pulmonary consumption. In one of the delusive intervals of this insidious complaint, an offer was made to him of the editorship of the *Dumfries Standard*, a paper about to be started in that town, while his salary as editor was to be £100 a year. Such a prospect of comfortable independence, and with occupation so much to his liking, was too tempting to be overlooked, and he signified his readiness to accept the situation should the recovery of his health be confirmed. But he rapidly grew worse, and died at Newburgh on the 13th of June, 1843, in the thirty-ninth year of his age. His remains were interred in Abdie church-yard, in the grave of his brother John, with whom he had been so closely united during life by their mutual hardships, tastes, and intellectual pursuits; and an interesting volume of his *Life, Correspondence, and Literary Remains*, was published in 1845 by Mr. William M'Combie, a farmer of Aberdeenshire, who like himself had been a writer on social economy.

BETHUNE, SIR HENRY LINDESAY, Bart. This gallant soldier, whose character and deeds are still cherished in the remembrance of the Persians, was born on the 12th April, 1787. He was of the ancient family of the Lords Lindsay of the Byres in Fifeshire, and son of Major Martin Eccles Lindsay Bethune, by a daughter of General Tovey. Embracing the military profession, he entered the East India Company's service as a cadet in 1804, and by successive steps rose to the rank of major. It was not however in India that his high reputation was to be won; but in Persia, to which country he was sent for the purpose of aiding Abbas-Mirza, crown-prince of Persia, in organizing his artillery; and he soon became the favourite not only of that distinguished prince, but of the whole Persian army. His personal presence indeed was enough to secure the admiration of such an imaginative, half-civilized people as the Persians; for he was about seven feet in height, while his successful deeds of daring seemed to realize those wonderful tales of ancient heroism to which they loved to listen. One of his exploits may serve as a specimen. During the war of the Persians against Russia, and while the armies of the two countries were in the field, Prince Abbas had set out one day on a hunting excursion, accompanied by his staff, and taking with him the artillery horses, to beat up for game. Availing themselves of such an opportunity, the Russians made an attack upon the Persian camp, and carried off Major Lindsay's six brass guns. As soon as the major returned he was made aware of the loss; and on surveying the Russian encampment with his glass, he saw the six guns ranged in front of their lines. At his summons his troopers were instantly in the saddle; at their head he charged across the plain; and after a short skirmish, in which the Russian advanced posts were swept aside, he broke through and rode down the troops opposed to him, and recovered and brought back the guns in the face of the whole Russian army.

Sixteen years were thus spent in the Persian service, and the deeds of Bethune had made him the *beau idéal* of an invincible champion in the eyes of the orientals. He was Rustan, the ancient Hercules of Persia, revived, or a new one raised in his room. But while his deeds fired their imaginations, his kindness to the soldiers, his strict impartiality, and the justice with which he caused their arrears to be paid in full—qualities very unusual among eastern commanders—made him almost an object of their idolatrous worship, so that all were delighted to obey such a leader, and ready to follow him to the death. Having successfully accomplished his mission to Persia, Bethune returned home; entered into possession of his estate of Kilconquhar in Fifeshire, inherited from his grandfather, David Bethune of Balfour, whose name he also adopted; and in 1822 married Coutts, eldest daughter of John Trotter of Dyrham Park, Herts. He now held the rank of major-general in the East India Company's service, from which he retired; and although as yet only thirty-five years old, he had achieved enough for fame, and risen high enough for ambition. But after an intermission of twelve peaceful years, events again summoned him to the field. They arose also in Persia, the country with which, next to his own, he was most closely connected. Futteh Ali Shah, the sovereign of Persia, had died; his eldest son, Abbas, the patron and friend of Bethune, had also died during his father's lifetime; and the throne of Persia had now devolved on Mahomed-Mirza, the son of Abbas-Mirza, and grandson of the late Shah of Persia. But in the East nothing is more precarious

than the right of succession through royal hereditary descent, and a pretender to the Persian throne appeared in the person of Zulli Sultan, the younger brother of Abbas, and uncle of the rightful heir, who levied an army and proclaimed war to make his title good. In this emergency Mahomed appealed to England, which he was not likely to do in vain, as the security of our rule in India was incompatible with a usurpation and civil war in Persia; and at the same time Bethune repaired to London, and offered his services to government for the suppression of those Persian disturbances. It was at once seen that the right man had voluntarily appeared at the critical moment, and in 1834 he was sent to Persia, with the local rank of colonel in Asia, and the office of accredited agent of the British government.

Great was the delight of the adherents of the rightful prince at the arrival of Bethune in their country once more. The stories of his former chivalrous deeds were still their favourite themes, and they triumphed in the assured success of their cause, now that he had reappeared to lead them onward. The rebels were proportionably dismayed, and to get rid of such a terrible enemy, the usurper, Zulli Sultan, offered a reward of four thousand tomanis to any one who would bring him this son of Shitan's head. A still more serious difficulty to the royal cause appeared in the reluctance of those British officers who possessed the claim of seniority of service to place themselves under the command of Colonel Bethune; but when he offered to take an inferior position, and serve under an older officer, as a temporary arrangement until the question should be settled by the authorities at home, they were shamed by such noble disinterested moderation, and unanimously recognized his right to command. High as had been the expectations of the Persians at his arrival, Bethune's proceedings during the short campaign which followed amply fulfilled them. With the advanced guard of the shah's army, which he commanded, he resolved to fall upon the rebels by surprise; but for this, such a swift and secret march was necessary as the clumsy armies of the East can seldom accomplish. But he did accomplish it, although for the purpose he was described as "dragging the army after him." The result was worth the effort, for "he came, saw, and conquered"—fell upon the rebels at unawares, scattered them by his fierce unexpected onset, and conclusively extinguished the rebellion by making Zulli Sultan prisoner. By this decisive victory, won in December, 1834, the way was opened to the young shah for a successful entrance into his capital of Teheran, who on his part was not slack to acknowledge the services of the conqueror. He heaped magnificent titles and gold medals upon Bethune, created him general and master-general of the artillery, and commanded that his worth and good services should be inscribed in the books of the records of the kings of Persia. One of these distinctions was too remarkable in oriental eyes to be passed over. He desired Bethune to select the best steed in the royal stable; and when this was done, the shah, after gracing the noble animal by riding on it into Teheran, presented it to the British commander. The royal attendants and nobles remonstrated with the shah, and besought him not to deprive the royal stud of such a jewel; but to them he answered, that he would rather lose fifty such horses, if such could be found, than disappoint his gallant champion. Nor was our government remiss in acknowledging the value of Bethune's services in Persia. He was in 1835 promoted to the local rank of major-general in his majesty's army in Asia, and on the 7th of March, 1836, created a baronet by

patent. But no titles could aggrandize him in the eyes of the Persians after this last campaign, in which he had outdone all his former achievements, and the public feeling is thus recorded in a private letter at the time from Persia, which was published in the *United Service Gazette*: "Great is the name of Lindesay in this country, and great ought it to be, for certainly he was just formed for service in Persia in troubled times like these. The confidence the soldiers have in him is quite wonderful, and all classes talk of him as if there never had appeared on earth before so irresistible a conqueror."

Having seen the disturbances of Persia composed, and the rightful heir established on the throne, Sir Henry Bethune, in September, 1835, returned to Scotland, and devoted himself to the peaceful life and duties of a country gentleman. In 1850, however, his health having failed, it was hoped that a visit to Persia and the influence of its climate might renovate his sinking constitution, and restore him to his wonted activity. Thither accordingly the sick man went; and the Persians who had seen him in the days of his grandeur, when his appearance and deeds were the realization of romance, now looked with sympathizing sorrow upon the gigantic ruin of him who had been their cherished hero and benefactor, and who now seemed to have returned for the sole purpose of dying among them. This foreboding was realized, for General Bethune died at Tabreez on the 19th of February, 1851, and the event was bewailed by the Persians as a national calamity. Sir Henry at his death left three sons and five daughters, and was succeeded in his title and estates by his eldest son, Sir John Trotter Bethune.

BETHUNE, JOHN. This poet and miscellaneous writer, the younger brother of Alexander Bethune, of whom we have already given a notice, was born at the Mount, in the parish of Monimail, Fifeshire, during the summer of 1810. As the poverty of his parents had restricted the education of Alexander to four or five months of school attendance, that of John was limited to a single day, after which he never was at school again. He was taught, however, to read by his mother, and was initiated into writing and arithmetic by his elder brother Alexander, who was his teacher in boyhood, and guardian and counsellor in more advanced years. His first employment was that of a cowherd, in which he was employed for several years; but at the age of twelve he was obliged to join his brother in the toilsome work of breaking stones on the turpikeroad. Under the desire of bettering his condition, and by the advice of a comrade, he apprenticed himself early in 1824 to a country weaver, and so speedily acquired dexterity in the trade, that at the end of the first year he found that he could earn fifteen shillings a week. This was much better than stone-breaking, and with the hope of being able to assist his aged parents, he resolved to follow weaving as his future craft, for which purpose he purchased a loom in 1825, and commenced in earnest, with his brother Alexander for his apprentice. But the national mercantile depression which followed so utterly disappointed his calculations, that his earnings were soon reduced to six shillings weekly, and finding that he could not get on at this rate, he returned to his old occupation as an out-door labourer.

Amidst all these hardships and privations of boyhood and youth, John Bethune had also to encounter the evils attendant upon a delicate constitution, and successive periods of weak health repeatedly suspended his labour in the fields. It was during these

intervals that he consoled himself with reading and composition, and under this harsh apprenticeship his intellectual qualities were called forth and ripened for action. As might be expected also, his poetical talents obtained the preference: in such lonely exercises, he found the easiest mode in which his intellect could be tasked, and the fittest vent for his emotions; and before he had completed his nineteenth year, he had composed upwards of twenty poetical pieces of considerable length, and all of them pervaded by considerable beauty both of sentiment and language. These attempts however, by which, in the course of time, he might make himself independent of bodily toil, for which he found himself unfitted, were for several years prosecuted by stealth, as if they were an offence denounced by every literary and intellectual tribunal. It speaks much for the wonderful modesty of the young poet, that he could so carefully withhold the knowledge of such compositions from his friends, and be content with the solitary satisfaction of stolen waters, and bread eaten in secret. None but his brother and his parents knew how these lonely hours were employed. "Up to the latter part of 1835," Alexander Bethune states in the memoir of his brother, "the whole of his writing had been prosecuted as stealthily as if it had been a crime punishable by law. There being but one apartment in the house, it was his custom to write by the fire, with an old copy-book, upon which his paper lay, resting on his knee, and this, through life, was his only writing-desk. On the table, which was within reach, an old newspaper was kept continually lying, and as soon as the footsteps of any one were heard approaching the door, copy-book, pens, and inkstand were thrust under the covering, and before the visitor came in, he had, in general, a book in his hand, and appeared to have been reading."

Since October, 1829, John Bethune had been employed as a day-labourer on the grounds of Inchrye, in the neighbourhood of his birth-place; but in 1835, on the death of the overseer, he was appointed his successor. The emoluments of this office considerably exceeded anything he had formerly enjoyed, for its salary was £26 a year, with the right of a cow's pasturage. To this new situation he gladly betook himself, with his brother Alexander as his assistant; but their satisfaction was short-lived, for the estate of Inchrye soon changed owners, which was followed by a change of office-bearers. Under these circumstances, the brothers were obliged to leave their snug appointment; and, to add to their misfortunes, the new landlord required the little cottage at Lochend, in which they had located their aged parents. Being thus altogether homeless John and Alexander stoutly resolved to erect a house for themselves, and this they did chiefly with their own hands, at Mount Pleasant, near Newburgh; and here the bold-hearted intellectual peasants, after having tried various kinds of hand-labour in vain, resolved to make literature their principal resource. The career of the elder in this department has been already stated, so that we shall confine ourselves to that of John. He contributed to the *Scottish Christian Herald*, *Wilson's Tales of the Borders*, and other serials, and supplied five pieces to his brother's *Tales and Sketches of the Scottish Peasantry*. He also jointly wrote with Alexander the *Lectures on Practical Economy*, designed to improve the homes and habits of the poor, and which was commended by the press, although the work did not become popular. He had thus tried the experiment of a literary life, and so far as he had gone it had proved a failure. But still the battle was not lost. His attempts, which were

wonderful for his education and circumstances, had obtained honourable recognition where such recognition could be available; he was not only young to this new life, but also young in years; and a few more attempts would have shown the qualities he possessed, and established his reputation as a worthy candidate for literary fame. It was too late, however, to attempt the trial anew. Deep mortification at the failure of the work on *Practical Economy* preying on a constitution already broken, brought on pulmonary consumption, and he died at Mount Pleasant on the 1st of September, 1839, in the thirtieth year of his age.

Thus passed away an obscurely born and hard-handed son of toil, who, without the training of college or school, and with few of even the ordinary opportunities of self-improvement, became a vigorous original prose writer, and a poet of no ordinary mark. While his writings in either capacity were stamped with the impress of true genius, they also showed much depth of reflection, ennobled by the spirit of genuine devotional piety. And such also was his daily life, simple, pure, and meditative, showing a man far above the ordinary mark, and isolated from the sphere in which he lived. His poems, by which he was so little known while he lived, but which will constitute his best commemoration, were published by his brother Alexander, with a memoir of their author, in 1840; and from the profits of the second edition, a sufficient sum was realized to erect a monument over the grave of John Bethune in the churchyard of the village of Abdie.

BINNING, HUGH, an extraordinary instance of precocious learning and genius, was the son of John Binning of Dalvennan, a landed gentleman of Ayrshire. He appears to have been born about the year 1627. In his earliest years he outstripped all his seniors in the acquisition of Latin. At Glasgow College, which he entered in his fourteenth year, he distinguished himself very highly in philosophy. What was to others only gained by hard study, seemed to be intuitively known by Binning. After taking the degree of Master of Arts, he began to study for the church. When Mr. James Dalrymple, afterwards Lord Stair, vacated the chair of philosophy at Glasgow, Binning, though not yet nineteen, stood a competitor with some men of graver years and very respectable acquirements, and gained the object of his ambition by the pure force of merit. Though unprepared for entering upon his duties, no deficiency was remarked. He was one of the first in Scotland to reform philosophy from the barbarous jargon of the schools. While fulfilling the duties of his chair in the most satisfactory manner, he continued his study of theology, and a vacancy occurring in the church of Govan, near Glasgow, he received a call to be its minister. Here he married Barbara Simpson, the daughter of a Presbyterian clergyman in Ireland. As a preacher, Mr. Binning's fame was very great: his knowledge was extensive, and there was a fervour in his eloquence which bore away the hearts of his congregation, as it were, to heaven. At the division of the church into resolutions and protesters, he took the latter and more zealous side, but yet was too full of virtuous and benevolent feeling to be a violent partisan. In order to heal the difference as much as possible, he wrote a treatise on Christian love. When Oliver Cromwell came to Glasgow, he caused a dispute to be held between his own Independent clergymen and the Scottish Presbyterian ministers. Binning having nonplussed his opponents, Cromwell asked the name of "that bold young man." On being told

that he was called Mr. Hugh Binning, the sectarian general said, "He hath bound well, indeed, but" (clapping his hand upon his sword) "this will loose all again." This excellent young preacher died of consumption, 1653, in his twenty-sixth year, leaving behind him a reputation for piety, virtue, and learning, such as has rarely been attained by any individual under that age. Besides his treatise on Christian love, he wrote many miscellaneous pieces of a pious nature, which were published in 1732, in one volume quarto. A selection from these, under the title of *Evangelical Beauties of Hugh Binning*, appeared in 1829, with a memoir of the author by the Rev. John Brown of Whitburn.

BISSAT, OR BISSART, PETER, professor of the canon law in the university of Bononia, was born in Fife in the reign of James V., being a descendant of Thomas Bissat, or Bissart, who was Earl of Fife in the reign of David II. He received instructions in grammar, philosophy, and the laws at the university of St. Andrews, and afterwards perfected his education at that of Paris. Having then travelled into Italy, he was honoured by the university of Bononia with the degree of Doctor of Laws, and shortly after became professor of the canon law in that seminary, in which situation he continued for several years "with great applause."

Bissat appears to have been a man of general accomplishment—a poet, an orator, and a philosopher; but his forte lay in the canon law. His various writings were published at Venice in 1565, in quarto, under the title *Patricii Bissarti Opera Omnia, viz. Poemata, Orationes, Lectiones Ferales, et Liber de Irregularitate*. The last of these compositions was a commentary on that part of the canon law which gives the reasons assigned by the Church of Rome for excluding certain laymen from the clerical office.¹ Bissat died in the latter part of the year 1568.

BISSET, CHARLES, an ingenious physician and

¹ Of these, as detailed by Bissat, an abstract may be interesting to the British reader, now happily so little familiar with the systems of the Catholic church. The primitive Christians, in admitting the clergy, observed exactly the rules laid down by St. Paul in the first epistle to Timothy. Yet sometimes, as we learn from St. Cyprian, at the pressing instance of the people, persons of noted merit, who refused through humility, were compelled to enter. By the canons, however, a man required to be a deacon before he could be a priest, and a priest before he could be a bishop. It was a general principle of the church, that the clergy should be chosen from the most holy of the laity, and, therefore, all liable to any reproach in their lives and conversations were excluded. Agreeably to this principle, which agreed with the injunction of St. Paul, that they should be blameless and without reproach, the first council of Nice excluded all those, specifically, who, after baptism, had been guilty of any sort of crime, such as heresy, homicide, or adultery; nor was penance any palliative, seeing that the memory of the offence always remained; while it was to be expected that those whose lives were without stain should be preferred to those who had fallen. Thus all persons who had performed penance were excluded. Those also were deemed *irregular*, and not entitled to admittance, who had killed any person, by accident or in self-defence, or who had borne arms even in a just war; who had twice married, or married a widow; or who engaged much in worldly affairs; all of which circumstances were held as derogating in some degree from the necessary purity of the individual. The only other moral disqualification was ignorance. The physical disqualifications were almost equally numerous. All deaf, dumb, or blind persons were excluded, as unable to perform their functions in a proper manner. All persons who were lame, or had any deformity calculated to create an aversion in the people, were declared unfit for orders. Madness and self-mutilation were disqualifications. All persons born out of wedlock were excluded, because, however innocent the individual in his own person, the associations which the sight of them was calculated to awaken were not favourable to virtue. Slaves, servants, children, and monastic clergy without the consent of their superiors, were excluded.

writer on fortification, was born at Glenalbert, near Dunkeld, in the year 1717. It is only known, regarding his parentage, that his father was a lawyer of some eminence, and a distinguished Latinist. After a course of medical studies at Edinburgh, he was appointed, in 1740, second surgeon of the military hospital in Jamaica, and spent several years in the West India Islands, and in Admiral Vernon's fleet, in order to become acquainted with the diseases of the torrid zone. But, while thus seeking to avert disease from others, Dr. Bisset became himself liable to its ravages. Having, in 1745, contracted ill health at Greenwich in Jamaica, he was obliged to resign his situation as second surgeon, in order to return to Britain. In May, 1746, he purchased an ensigncy in the 42d (Highland) regiment, then commanded by Lord John Murray. By this transition his attention was turned from the medical to the military profession, and fortification became his favourite study. After a fruitless descent on the coast of Brittany in September, 1748, and passing a winter at Limerick in Ireland, the regiment was, in the beginning of next campaign, brought into action at Sandberg, near Hulst, in Dutch Flanders, where one Dutch and two English regiments suffered very severely. Here Dr. Bisset employed himself in drawing a sketch of the enemy's approaches, and some time after, in another of Bergen-op-Zoom, with the permanent lines, the environs, and the enemy's first parallel; which were presented by his colonel to the Duke of Cumberland, the commander-in-chief. The duke was so much pleased with these specimens of Dr. Bisset's military knowledge, that he ordered him to attend the siege of Bergen-op-Zoom, and give due attention daily to the progress of both the attack and the defence, in order to form a journal of the whole proceedings. This distinguished duty Dr. Bisset undertook with a modest reluctance, the result rather of inexperience than of any consciousness of want of knowledge. The result, however, was highly honourable to him. His journals, duly illustrated with plans, were daily delivered to Lord John Murray, who forwarded them every second or third day to the duke, who was then at Maestricht, at the head of the allied army, observing the motions of the French army under Marshal Saxe. His royal highness was pleased to express his approbation, by recommending Dr. Bisset to the Duke of Montagu, then master-general of the ordnance, who honoured him with a warrant as engineer extraordinary to the brigade of engineers; he was at the same time promoted to a lieutenantcy in the army. At the end of the war, Bisset being placed on half-pay, he had full leisure to pursue his studies in fortification, and also to visit the principal specimens of the art upon the Continent. The result was his *Essay on the Theory and Construction of Fortifications*, which appeared in 1751, in 8vo.

His attention being now disengaged from this pursuit, he resumed his original profession, and, for the sake of a healthy air, which was necessary to his weakly constitution, retired to practise at the village of Skelton, in Cleveland, Yorkshire, where he spent the remainder of his life. In 1755, when the Seven Years' war was impending, he published a *Treatise on the Scurvy, with Remarks on the Cure of Scorbutic Ulcers*, which he dedicated to Viscount Anson and the other lords of the admiralty. In 1762 appeared his *Essay on the Medical Constitution of Great Britain*, which he inscribed to his friend Sir John Pringle. In this work he shows the effects of the change of weather, and of the seasons, on the diseases of Great Britain; and at the conclusion is an interesting paper on the virtues of the herb bear's-foot in the cure of

worms. In 1765 the university of St. Andrews conferred upon him the degree of M.D. In 1766 he published, at Newcastle, a volume of *Medical Essays and Observations*, in which are upwards of twenty papers on the climate and diseases of the West Indies, which his experience in that country had enabled him to illustrate in a most satisfactory manner; besides some others on the chronic diseases of Great Britain, particularly the whooping-cough and the scorbutic itch, as well as many chirurgical remarks, which show a mind bent on the improvement of his profession. A few years before his death he deposited in the library of the infirmary at Leeds a manuscript of medical observations, in octavo, and extending to nearly seven hundred pages; for which the physicians of that institution honoured him with a formal vote of thanks. Dr. Bisset also presented a manuscript treatise on fortification to the Prince of Wales (afterwards George IV.), which was deposited in his royal highness's private library. These, with a small published treatise on naval tactics, and a few political papers, constituted the whole of the intellectual exertions of this distinguished man; who died at Knayton, near Thirsk, in May, 1791, aged seventy-five years.

BLACK, JOHN. This eccentric genius and distinguished London journalist was born near Dunse, Berwickshire, in 1783. He was of very lowly parentage, and to add to the difficulty of attaining eminence under such circumstances, he lost his father in infancy, and his mother when he was only twelve years of age. He gave, however, such early indications of talent and aptitude for learning, that his mother, like a true Scottish dame of the lower orders, hoped that her boy might at a future day "wag his pow in a pu' pit," and had encouraged his dawning genius by every means in her power. Black was at an early age sent to the parish school at Dunse, which was four miles distant, and these eight miles in going and returning the boy trudged daily on foot—a practice that laid the foundation of those peripatetic habits which lasted with him through life. Being unable, after the death of his mother, to perfect his education so as to qualify himself for realizing her hopes, he was obliged, at the age of fourteen, to enter a factor's office in Dunse, as an errand-boy; but after staying long enough in this situation to discover that he was fit for something better, he went in his eighteenth year to Edinburgh, and obtained employment at a stationer's. Still migrating upward, he became successively a clerk in two, if not three, offices of writers to the signet in Edinburgh. It was evident, however, from his studies that these changes were only steps to a different end; for by self-teaching he made himself master of Latin and Greek, and not content with classical learning, he acquired the German language from an Austrian musician belonging to the Edinburgh theatre, and Italian from another foreign musician, teaching them the English language in return. He also acquired French so as to read it with tolerable ease, but without being able to converse in it with sufficient correctness.

After these acquirements, Black's growing ambition carried him to London, the proper sphere where he could turn them to the best account. He was now twenty-seven years old when he set out on this journey, which was performed solely on foot, and he arrived in the great metropolis with only three halfpence in his pocket. It was as hopeful a foundation for a London fortune as the most enterprising Scotsman could desire. It was well for Black that he also brought letters of introduction to

Mr. Perry, the proprietor and editor of the *Morning Chronicle*, one of these being from Mr. Gibson, afterwards Sir James Gibson-Craig. Mr. Perry, an admirable judge of such applicants, was pleased with the bold active spirit and talents of the Scottish candidate, and employed him forthwith upon his paper. Here he was not only at home, but among the honoured, for the *Morning Chronicle* had lately given employment to John Campbell, afterwards Lord-chancellor of England, and to Mr. (afterwards Serjeant) Spankie; while the reporters of the paper at the time of Black's arrival and afterwards, were chiefly Scotch and Irish young men of high talent and promise. His employment as a member of this staff was to translate the foreign journals, and to take his "turn" as a reporter in the gallery of the parliament house. Black soon obtained the reputation of being a very rapid reporter; but Mr. Proby, the managing conductor under Mr. Perry, used to declare, that his chief merit consisted in the wonderful speed with which he moved from the House of Commons to the office in the Strand. At this last place, also, Black's eccentricities were still more remarkable than his light-heeled speed. He kept the reporters' room in a ferment by loud radical declamations and debates upon the subject before the house, while the overseer was worried by these delays, which prevented the "copy" from being delivered until the last moment. In consequence of these peculiarities, Black was called by his competitors the "Professor of Logic," and the "Flying Scotchman." Finding in the earlier part of his career in London that something more than reporting in a newspaper was necessary for his subsistence, he also laid himself out for occupation among the booksellers, not however in works of original authorship, but as a translator. His translations were the following:—*Political Essay on the Kingdom of New Spain*, &c., from the French of A. de Humboldt, 4 vols. 8vo, 1811–12; *Travels through Norway and Lapland*, from the German of Leopold, with notes, and a life of the author, by Professor Jamieson, 4to, 1813; *Memoirs of Goldoni, the Celebrated Italian Dramatist*, written by himself, from the French, 2 vols. 8vo, 1813; and a *Course of Lectures on the Dramatic Arts and Literature*, translated from the German of Schlegel, 2 vols. 8vo, 1815.

The industry, perseverance, and talent of Mr. Black were crowned with success, when, two years before Mr. Perry's death (which occurred in 1821), he was appointed principal editor of the *Morning Chronicle*. So well also was his reputation established, that he held this office in permanence, so that when the paper was sold by Mr. Perry's executors in 1823, Mr. Black was continued sole editor, and such was also the case when it was re-sold in 1834. The whole period of his editorship comprised nearly a quarter of a century, and during that time, however seldom he may have appeared in the streets of the political world, or been recognized by the moving crowds, he was still a power in the state that made himself felt by all parties alike, and next to the Jupiter Tonans of the *Times* he occupied the highest place in political journalism. His character while holding this elevated position was enough to disarm envy, and secure for him the general esteem. "He was necessarily brought," says his biographer, "into social and political intercourse, during that time, with some of the principal men of his day. And it is but doing scanty justice to his memory to say, that no one knew him who did not love him for the guilelessness of his disposition; and admire him, not only for the vast range of his learning, but for his sterling and fearless honesty of purpose, and his

sincere, earnest, and successful advocacy of liberal principles."

The personal and domestic habits of Mr. Black, even in London and while editor of such a journal, were not only characterized by the simplicity of his early life, but by an eccentricity in which few but himself would have ventured to indulge. Instead of having a separate mansion of his own, where he could receive his titled friends, or play the courteous patron before admiring dependants, he dwelt at his workshop, occupying the higher story of the office of the *Morning Chronicle*, in Norfolk Street, Strand. He was twice married, but his first marriage was under circumstances of which little is known. The second Mrs. Black was Miss Cromeck, sister of the artist of that name, residing in Newman Street, Oxford Street, where Black was a temporary lodger. This person is described as a woman of remarkable appearance, in person something like Meg Merrilies in the tale of *Guy Rannering*. The style of living followed by the pair in the garrets of Norfolk Street was such as to amaze strangers, and amuse their acquaintances. The walls of the rooms were wainscotted with books, the floors were thickly carpeted or rather paved with the same commodities, and between the piles and pyramids it was a task of difficulty for the visitor to thread his way. Even in the bed-room, the sides of the bed itself were blocked up with such stockades of volumes, that to enter it laterally was impossible, and the pair were obliged to effect a lodgment by creeping in at one end of it. And these books were not to be moved, or dusted by any hand but his own. In his walks Black's constant attendant was a large Newfoundland dog, named Cato, whom he used to tug along from one bookstall to another, or to run with to and from Blackheath and London at all hours of the night.

In the enumeration of Mr. Black's literary friends who contributed articles and communications to the *Morning Chronicle*, we have an interesting peep behind the curtain of political journalism, and can mark how an influential London newspaper is supported and conducted. The following quotation on this subject would be too long, were it not for the information which it gives to the uninitiated, on which account we quote it almost entire:—

"The late Duke of Sussex was an active purveyor for him [Mr. Black] during the illness of George III. and the regency. His other frequent writers were Sheridan, Adair, D. Kinnaird, General Palmer, Mr. E. Dubois, the Rev. Mr. Colton, Lord Holland (very often), the late John Allan, Porson, Jekyll, 'Tommy Hill,' Horace Smith, and other worthies now no more. To these especially, and as more eminent political writers, may be added the names of Albany Fonblanque, James Mill, David Ricardo, C. P. Thomson (afterwards Lord Sydenham), Mr. M'ulloch (one of his most steady and attached friends), and Mr. Senior. These gentlemen wrote chiefly on subjects of political economy. Mr. Chadwick, of course, provided Mr. Black with ample material on the poor-laws. Mr. Francis Place, though a Charing-cross tailor, supplied Mr. Black, as also did Mr. Hume, with invaluable material in the discussion of the repeal and alteration of the combination laws, and the export of machinery, in 1824–5. Many members of the Upper House also furnished him with contributions, especially the 'Jockey of Norfolk'—called the first Protestant duke, the late Lords Erskine, Moira, Lauderdale, Durham, and Essex. Among the deceased commoners we have omitted honourable mention of the late Charles Buller, who in 1830, then a student in Mr. Coulson's

chambers, first used his pen for Mr. Black in lively and brief articles. The supposed ghost of Junius also haunted the editor's room. Sir Philip Francis was the author of the 'Historical Questions' which appeared in the *Chronicle*; and Proby, the sub-editor, was struck by the similitude of the hand-writing to the facsimiles of the letters of Junius in the *Public Ledger*. Sir Philip long occasionally communicated both with Mr. Perry and Mr. Black. . . . Lord Brougham's hand-writing was well known during the queen's trial, and for fully a quarter of a century afterwards. The Right Hon. Edmund Ellice, the member for Coventry, was, years since, a frequent and valued correspondent. . . . Mr. Joseph Parkes was a constant contributor from 1824 to later years; and we believe that gentleman penned in Birmingham most of the leading articles in the *Chronicle* on tithes, during the public agitation of that question and the commutation act. The same hand kept up a constant cannonade in Black's leaders on municipal, and parliamentary, and law reform, preceding 1831, and subsequently to the later settlement of those questions. Colonel Thompson had also his *entrée* to Black's private room, and early launched the corn-law question, years before the Manchester League and Sir Robert Peel 'settled' it. Old Colonel Jones, in the *Morning Chronicle*, as well as in the *Times*, in 1830, 31, and 32, discharged his rifle-shots into the ranks of the 'corruptionists' of that day. Tom Moore deposited with Black occasional prose leaders on Irish party subjects. He also contributed poetry both to the *Chronicle* and the *Times*. Black's old friend and schoolfellow, Mr. Thomas Young, now living, was another invaluable friend of both journals, especially in the crisis of the reform acts, writing numerous articles for the *Chronicle*; and also keeping the press *au courant* in such information as Lord Melbourne (to whom Mr. Young was then private secretary) considered important for the right direction of public opinion. Sir Robert Peel, with all his prudery, did not think it inconsistent with his dignity to send a 'communication' now and then, with 'Sir Robert Peel's compliments.' He also had communications from Windsor in subsequent reigns. George III. was more than suspected by Mr. Black of the perpetration of a leading article, the subject being himself; but the proof in this case was presumptive, not positive, though quite satisfactory to Mr. Black. Nor was Black's useful connection confined only to noblemen and gentlemen. He had a powerful corps of female contributors, among whom were the late Miss Edgeworth, and Mrs. Marcet, Lady Caroline Lamb, and, subsequently, a living lady of singular talent and force of mind, wife of an eminent historian."

In this detail of the gratuitous assistants of the editor of the *Morning Chronicle*, the reader can easily detect the secret of the power of a London newspaper. While its literary character occupies so high a place, the correctness and importance of its political intelligence make it the observatory by which the timepieces of public opinion are regulated. While the contributors, however, can preserve this incognito with the public, they cannot thus conceal themselves from the editor, and being the possessor of such dangerous knowledge, his character must be well established for integrity, prudence, and secrecy, before such a power can be intrusted to his hands. But this character Mr. Black possessed in an eminent degree. While his political acquaintanceship was so extensive, and while so many compromising articles were confided to his keeping, both by British and Irish statesmen

and literary celebrities, in every case their secret was kept with inviolable fidelity. Nor was his sagacity in discovering youthful talent, and his readiness to cherish and bring it forward, inferior to his other qualities; and many a young writer whose early attempts he encouraged and liberally rewarded, found his patronage their first stepping-stone to fortune and fame. Thus, among others, it was with the celebrated Charles Dickens, who in his youth was a reporter to the *Morning Chronicle*, while Black was its editor. In a period of political turmoil, while public resentments are hot, and the language of journalism unmitigated, it is almost impossible for the editor of a great leading organ of public opinion to hold onward in his course unchecked; and hostile invitations will occasionally be sent to him requiring both wisdom and self-denial to refuse. Such was the case with Black, who on two occasions was "called out," in one instance by a professional colleague, to whom he had expressed certain political opinions too strongly, and in the other by Mr. Roebuck, who supposed Black to be author of an article in the *Chronicle*, which, however, he did not write. Happily both "affairs of honour," as they are called, terminated bloodlessly, and the Gothic custom has now fallen into contempt.

Of the many statesmen with whom Mr. Black's position brought him into contact, one was Lord Melbourne, while he held the office of premier, who took great delight in the varied learning, extensive information, and simplicity, bluntness, and good-nature of the editor. In consequence of their mutual esteem, they were enabled at their interviews to unbend from the cares of politics, and find refuge in the literature of the past age, or general chat upon the living world around them. At one of these meetings Lord Melbourne said abruptly, "Mr. Black, you are the only person who comes to see me, who forgets who I am." Black stared, and the other added, "You forget that I am prime minister." The editor was about to offer an apology, when the jauntily easy-minded premier continued, "Everybody else takes especial care to remember it; but I wish they would forget it; for they only remember it to ask me for places and favours. Now, Mr. Black, you never ask me for anything, and I wish you would; for, seriously, I should be most happy to do anything in my power to serve you." "I am truly obliged," said Black, "but I don't want anything: I am editor of the *Morning Chronicle*; I like my business, and I live happily on my income." "Then by G— I envy you," cried his lordship, "and you're the only man I ever did."

Mr. Black retired from the management of the *Morning Chronicle* in 1844, "under circumstances," adds his biographer, "which excited some regret among the liberal party, but on which it is not necessary for us to dwell." This obliged him to part with his library, a large and valuable collection, for he had been, through the greater part of his life, an enthusiastic book-hunter—and with the proceeds, added to a sum contributed by the proprietors of the *Chronicle*, and other sums collected for him among the leaders of the liberal party, he purchased for himself a small annuity, which was sufficient for all his simple wants. He also tenanted a cottage at Birling, in Kent, which he had, with a piece of ground to cultivate, from one of his friends at a merely nominal rent, and here he passed the remaining years of his life in rural occupations and contemplation, unmoved by the roar of those political elements amidst which he had dwelt so long. Here, also, he finally sickened, and here he died in June, 1855.

THE LIFE OF
J. WILSON

By J. WILSON

BLACK, JOSEPH, M.D., "the illustrious Nestor (as he has been termed by Lavoisier) of the chemical revolution,"—was not a native of Scotland, having been born on the banks of the Garonne, in France; but as his father was of Scottish extraction, while his mother was a native of that country, and as Scotland, further, was the scene not only of the better part of his life, but of all those exertions in science which will transmit his name to posterity, it seems proper that he should obtain a place in this work, even at the expense of a slight violation of its leading principle.

John Black, the father of the illustrious subject of this memoir, was a native of Belfast, descended, as already mentioned, from a Scottish family, which had for some time been settled there. For the purpose of carrying on the profession of a wine merchant, he resided chiefly at Bordeaux, where he married a daughter of Mr. Robert Gordon of Hillhead in Aberdeenshire, a gentleman who also resided at Bordeaux, and was engaged in the same trade. The sister of Mrs. Black was mother to Mr. Russel, professor of natural philosophy in the university of Edinburgh, and their aunt was mother to Dr. Adam Ferguson, professor of moral philosophy in the same college, and author of the *History of the Roman Republic*. While Mr. John Black resided at Bordeaux he was honoured with the friendship of Montesquieu, who was president of the parliament or court of justice in that province. The regard which Montesquieu entertained for Mr. Black was testified in the warmest terms when the latter was proposing to return to his native country. "I cannot," said he on that occasion, "be reconciled to the thoughts of your leaving Bordeaux. I lose the most agreeable pleasure I had, that of seeing you often, and forgetting myself with you."

Dr. Black was born in the year 1728. In 1740, a few years before his father retired from business, he was sent home, in order to have the education of a British subject. After spending some time at the schools of Belfast, he was sent, in 1746, to complete his studies at the college of Glasgow. Here his attention became decidedly fixed upon physical science; insomuch that, on being desired to select a profession, he chose that of medicine, on account of its allowing the greatest scope for such studies. It was about this time that Dr. Cullen had been appointed lecturer on chemistry in Glasgow university. Hitherto this science had been only treated as a curious, and, in some respects, a useless art. This great man, conscious of his own strength, and taking a wide and comprehensive view, saw the unoccupied field of philosophical chemistry open before him. He was satisfied that it was susceptible of great improvement, by means of liberal inquiry and rational investigation. It was perhaps the good fortune of Dr. Black in falling under such a master, that gave his mind a peculiar bent in favour of this department of physical science. His previous acquirements and extraordinary aptitude speedily became known to Dr. Cullen, who was at all times remarkable for the personal attentions he paid to his pupils. Black became a valuable assistant to Dr. Cullen in his chemical operations, and his experiments were sometimes publicly adduced in the lecture, as a sufficient authority for various new facts. Thus commenced a friendship between two great men, which was never afterwards interrupted until their death, and which was of considerable service to mankind.

In 1751 Black was sent to Edinburgh to complete the course of his medical studies. At this time the mode of action of lithotropic medicines, but particularly lime-water, in alleviating the pains of stone

and gravel, divided the opinions of professors and practitioners. This subject attracted the attention of Black; and it appears from some of his memorandums that he at first held the opinion that the causticity of alkalies was owing to the igneous matter which they derive from quicklime. Having prosecuted his experiments on magnesia, the grand secret of nature, which for ever will be associated with his name, was laid open to him. He perceived that the acrimony of these substances was not owing to their combination with igneous particles; that it was their peculiar property; and that they lost this property, and became mild, by combining with a certain portion of air, to which he gave the name of **FIXED AIR**, because it was fixed or become solid in the substances into the composition of which it entered. He discovered, for instance, that a cubic inch of marble consisted of half its weight of pure lime, and a quantity of air equal to six gallons measure. This grand discovery, which forms one of the most important eras of chemical science, was the subject of his inaugural essay on obtaining his degree as Doctor of Medicine; and the reputation it acquired for him was the means, in 1756, of placing him in the chair of chemistry at Glasgow, then vacated by Dr. Cullen, who was transferred to the same chair in the college of Edinburgh. The theory of fixed air (now termed by chemists carbonic acid gas) was speedily propagated on the Continent, where at this time chemistry was occupying the attention of many great men. In Germany, Dr. Black's opinions, though placed on the firmest basis by experiments, met with much opposition, which, it appears, gave him an uneasiness not to have been expected from his philosophical, and rather indolent, character. In France, however, he was very differently treated. Lavoisier, in sending him a copy of his treatise on respiration, thus expressed himself: "It is but just you should be one of the first to receive information of the progress made in a career which you yourself have opened, and in which all of us here consider ourselves your disciples." To this Black replied, with a just admiration of what the French chemists were doing, and without reference to any merit of his own.

On his assuming the chair of chemistry at Glasgow, that of anatomy was also imposed upon him; but this latter he soon exchanged for that of medicine, for which, it would appear, he was better qualified. He gave great satisfaction by the perspicuity and simplicity, the caution and moderation, which he discovered in his medical lectures. At the same time, he became a favourite practitioner in the city, where his engaging appearance and manners, and the benevolent and unaffected interest which he took in all the cases intrusted to his care, rendered him a most welcome visitor in every family. His principal friend at Glasgow was his associate Dr. Adam Smith, professor of moral philosophy, with whom he had become intimate when attending the university as a student. A peculiar simplicity and sensibility, an incorruptible integrity, the strictest delicacy and correctness of manners, marked the character of each of the philosophers, and firmly bound them in the closest union.

"It seems to have been between the years 1759 and 1763¹ that his speculations concerning **HEAT**, which had long occupied his thoughts, were brought to maturity. And when it is considered by what simple experiments, by what familiar observations, Dr. Black illustrated the laws of fluidity and evaporation, it appears wonderful that they had not long

¹ The following most interesting account of one of the principal discoveries in modern science is from a biographical memoir, prefixed by Professor Robison to Dr. Black's Lectures.

before been observed and demonstrated. They are, however, less obvious than might at first sight be imagined, and to have a distinct and clear conception of those seemingly simple processes of nature required consideration and reflection. If a piece of wood, a piece of lead, and a piece of ice are placed in a temperature much inferior to that of the body, and if we touch the piece of wood with the hand, it feels cold; if we touch the piece of lead, it feels colder still; but the piece of ice feels colder than either. Now, the first suggestion of sense is, that we receive cold from the wood; that we receive more from the lead, and most of all from the ice; and that the ice continues to be a source of cold till the whole be melted. But an inference precisely the contrary to all this is made by him whose attention and reflection has been occupied with this subject. He infers that the wood takes a little heat from the hand, but is soon heated so much as to take no more. The lead takes more heat before it be as much satiated; and the ice continues to feel equally cold, and to carry off heat as fast as in the first moment till the whole be melted. This, then, was the inference made by Dr. Black.

“Boerhaave has recorded an interesting observation by Fahrenheit, namely, that water would sometimes grow considerably colder than melting snow without freezing, and would freeze in a moment when shaken or disturbed, and in the act of freezing give out many degrees of heat. Founded on this observation, it appears that Dr. Black entertained some vague notion or conjecture that the heat which was received by the ice during its conversion into water was not lost, but was still contained in the water. And he hoped to verify this conjecture by making a comparison of the time required to raise a pound of water one degree in its temperature, with the time required to melt a pound of ice, both being supposed to receive the heat equally fast. And that he might ascertain how much heat was extricated during congelation, he thought of comparing the time required to depress the temperature of a pound of water one degree with the time required for freezing it entirely. The plan of this series of experiments occurred to him during the summer season. But for want of ice, which he could not then procure, he had no opportunity of putting them to the test. He therefore waited impatiently for the winter. The winter arrived, and the decisive experiment was performed in the month of December, 1761. From this experiment it appeared that as much heat was taken up by the ice during its liquefaction as would have raised the water 140 degrees in its temperature, and on the other hand, that exactly the same quantity of heat was given out during the congelation of the water. But this experiment, the result of which Dr. Black eagerly longed for, only informed him how much heat was absorbed by the ice during liquefaction, was retained by the water while it remained fluid, and was again emitted by it in the process of freezing. But his mind was deeply impressed with the truth of the doctrine by reflecting on the observations that presented themselves when a frost or thaw happened to prevail. The hills are not at once cleared of snow during the sunshine of the brightest winter day, nor were the ponds suddenly covered with ice during a single frosty night. Much heat is absorbed and fixed in the water during the melting of the snow; and, on the other hand, while the water is changed into ice, much heat is extricated. During a thaw the thermometer sinks when it is removed from the air and placed in the melting snow; and during severe frost it rises when plunged into freezing water. In the first case the snow receives heat, and in the last

the water allows the heat to escape again. These were fair and unquestionable inferences, and now they appear obvious and easy. But although many ingenious and acute philosophers had been engaged in the same investigations, and had employed the same facts in their disquisitions, those obvious inferences were entirely overlooked. It was reserved for Dr. Black to remove the veil which hid this mystery of nature, and by this important discovery to establish an era in the progress of chemical science—one of the brightest, perhaps, which has yet occurred in its history.”

Dr. Black explained his theory of *latent heat*—such was the name he himself gave to it—to the members of a literary society, April 23, 1762, and afterwards laid before his students a detailed view of the extensive and beneficial effects of this habitude in the grand economy of nature. From observing the analogy between the cessation of expansion by the thermometer during the liquefaction of the ice, and during the conversion of water into steam, Dr. Black, having explained the one, thought that the phenomena of boiling and evaporation would admit of a similar explanation. He was so convinced of the truth of this theory, that he taught it in his lectures in 1761, before he had made a single experiment on the subject. At this period his prelections on the subject of evaporation were of great advantage to Mr. James Watt, afterwards so distinguished for his application of steam-power. His discovery, indeed, may be said to have laid the foundation of that great practical use of steam which has conferred so immense a blessing upon the present age.

In 1766, on Dr. Cullen being removed from the chair of chemistry at Edinburgh, to that of medicine, Dr. Black, as formerly, supplied the vacant place. In this new scene, he saw that his talents would become more conspicuous, and of more extensive utility. He was therefore encouraged to devote himself, with still more enthusiastic zeal, to his duties as a chemical teacher. In this he was so far successful, that chemistry at length became a fashionable study in the Scottish capital, and a necessary part of the education of every gentleman. After this period, however, he retired from the field of chemical research, which now began to be occupied by a great number of distinguished philosophers. The cause of this was the delicate state of his health, aided, perhaps, a little by that indolence, or rather perhaps absence of ambitious motive, which has been already alluded to. It is to be regretted that, for the same reason, he can scarcely be said to have published anything to the world, by which his discoveries might be permanently secured to the honour of his own name. From the period of his accession to the chemical chair at Edinburgh, he was, for thirty years, a most distinguished member of the professional society which then adorned the capital, and has since given such an Augustan eclat to the latter period of the eighteenth century. Whatever obstruction his health proved in the way of publishing, it never marred the active discharge of his duties. His courses became every year plainer and more familiar, and were attended by a larger number of pupils. The simplicity and elegance of his experiments were always much admired. His manner and appearance were peculiarly pleasing. His voice in lecturing was low and fine, and his articulation so distinct that it was perfectly well heard by a large audience. His discourse was remarkable for plainness and perspicuity; all his illustrations, whether by experiment or by reference to the processes of nature, were quite apposite; his hearers rested with the most entire confidence on his conclusions,

and even the most illiterate could not mistake his sentiments.

Dr. Black's conduct in private life was marked by a striking degree of decorum, without the slightest approach to formality. His habit of studying physical science rendered him very much a man of facts and demonstrations: he is said to have been so entirely destitute of fancy, or to have so effectually repressed that faculty, that he never was known to utter a joke. In his domestic affairs he was rigidly frugal and methodical; yet his house was open to an enlightened hospitality, in which he enjoyed as much of the society of his friends as his delicate health would permit. His chief friends were Smith, Hume, Carlyle, Home, and Hutten. The last was closely connected with him in philosophical pursuits, as well as in the bonds of private friendship—notwithstanding that there were some striking points of difference between the two men. In his latter days, Dr. Black sunk into a low state of health, and only preserved himself from the shocks of the weather in this variable climate by a degree of care almost fantastic. Thus he spun out the thread of life to the last fibre. It was his generous and manly wish that he might never live to be a burden to his friends; and never was the wish more completely gratified. On the 26th of November, 1799, and in the seventy-first year of his age, he expired, without any convulsion, shock, or stupor, to announce or retard the approach of death. Being at table with his usual fare—some bread, a few prunes, and a measured quantity of milk diluted with water, and having the cup in his hand when the last stroke of the pulse was to be given, he had set it down upon his knees, which were joined together, and kept it steady with his hand in the manner of a person perfectly at ease, and in this attitude expired, without spilling a drop, and without a writhe in his countenance; as if an *experiment* had been required to show to his friends the facility with which he departed. His servant opened the door to tell him that some one had left his name, but, getting no answer, stepped about half-way towards him, and seeing him sitting in that easy posture, supporting his basin of milk with one hand, he thought that he had dropped asleep, which he had sometimes seen happen after his meals. The man went back and shut the door, but before he got down-stairs, some anxiety that he could not account for made him return and look again at his master. Even then he was satisfied, after coming pretty near, and turned to go away, but again returned, and coming quite close, found his master without life. Dr. Black, who had never been married, left more money than any one had thought he could have acquired in the course of his career. It was disposed of by his will in a manner highly characteristic. Being divided into ten thousand shares, it was parcelled out to a numerous list of relations in shares, in numbers, or fractions of shares, according to the degree in which they were proper objects of his care or solicitude.

BLACKADDER, JOHN, a distinguished preacher of the time of the *persecution*, was the representative of an ancient but decayed family—Blackadder of Tulliallan—and was born in the year 1615. He was nephew to Principal Strang of Glasgow, and grand-nephew to the famous chorographer Timothy Pont. His theological education took place under the eye of the former of these eminent men, and having been duly licensed by the Presbyterian church, then in its highest purity and most triumphant domination, he received a call, in 1652, to the parish church of Troqueer, in the neighbourhood of Dum-

fries. Previous to this period he had married the daughter of a wealthy merchant of that town, named Haning. Mr. Blackadder commenced his ministerial labours with a zeal which seems to have been singular even in those times. He, in the first place, gathered around him a very active body of elders, whom he set to work in every direction, upon the task of cultivating the religious mind of the parish. He also instituted a very strict system of moral discipline among his flock. Not content with the weekly sermons on Sunday, he instituted lectures on the ordinary days, which were attended by many persons from a distance. He also projected a plan for occasionally interchanging duty with the neighbouring parochial clergy, which was carried into effect within the entire limits of the presbytery, and is said to have been attended with the best results. The church at this time rested undisturbed under the sway of Cromwell, who gave it toleration in every respect except as a collective body; Mr. Blackadder, therefore, found no bar to his progress, which was so exceedingly rapid, that in less than two years he had the satisfaction of seeing a thorough reformation in the devotional habits of his parishioners. Evil days, however, came at last. In 1662 the Episcopal form of church-government was forced, by the restored house of Stuart, upon a people who were generally repugnant to it. Mr. Blackadder, so far from complying with the new system, employed himself for several successive Sundays in exposing what he considered its unlawfulness, and, in his own words, "entered his dissent in heaven" against it. The presbytery of Dumfries, upon which the influence of so zealous a mind was probably very great, gave a positive refusal to an order of the parliament to celebrate the anniversary of the restoration at a festival. A party of fifty horse was accordingly sent to bring the whole of this refractory band of churchmen to Edinburgh. On the day of their arrival at Dumfries, Mr. Blackadder was engaged to preach in the town church. He was entreated not to appear in the pulpit, lest he should exasperate the soldiers against him; but instead of taking this advice, he desired the gallery to be cleared, in order that the military might attend his sermon. They did so, and listened decorously to the denunciations which he could not help uttering against all who had been concerned in the late religious defections. He and some of his brethren were next day conducted in an honourable captivity to the capital, where he underwent some examinations, but was speedily released by the interest of his friends. He was now, however, obliged to demit his charge, in favour of an Episcopal incumbent. On the last Sunday of October he preached a farewell sermon to his attached flock.

"This," we are informed, "was a day of anxious expectation throughout the country, and made an impression on the minds of those who witnessed it never to be forgotten. The church of Troqueer stood (as it now does) upon a gentle eminence on the banks of the Nith, commanding an extensive view of the surrounding country, which, in the neighbourhood of Dumfries, presents a delightful variety of local scenery. On the morning of that memorable Sabbath Mr. Blackadder had risen early from prayer and private communion. He stepped forth to meditate on the subject of the day. There was a gloom and heaviness in the atmosphere that seemed to correspond with the general melancholy. A fog, or thick haze, that covered the face of the earth as with a gray mantle, had retired from the vale of Nith towards the mountains. As he paced his little garden with a slow and pensive step, his contemplations were suddenly interrupted by the tolling of the

morning bells, several of which, in the adjacent parishes, were distinctly audible from the uncommon stillness of the air. These hallowed chimes, once the welcome summons to the house of prayer, now sounded like the knell of their expiring liberties, reminding him how many of his brethren were, like himself, preparing to bid their last adieu, amidst the tears and blessings of their people. At this signal of retirement he betook himself to the duties of the closet, to hold nearer intercourse with Heaven, and fortify himself for the solemn occasion.

"The people, at an early hour, had been straggling on the height, but kept aloof from the church, unwilling to put their minister to hazard by convening in multitudes, which had been discharged as a breach of peace and good order. They collected by degrees in small scattered groups about the churchyard, occupied in dark conjectures, and waiting the minister's approach with extreme anxiety. Mr. Blackadder made his appearance with his wonted firmness and composure, and with the same placid serenity of countenance for which he was remarkable. The audience was not numerous, but every feature appeared settled into a deep and earnest concern. Most of them were dissolved in tears, and at many parts of the discourse there were loud and involuntary bursts of sorrow.

"Towards the middle of the sermon, an alarm was given that a party of soldiers from Dumfries were on their march to seize him, and had crossed the bridge. Upon this he closed hastily, pronounced the blessing, and retired to his chamber. The military surrounded the churchyard, and, as the people departed, they took down the names of all those who belonged to Dumfries, or any of the other parishes, as the law had affixed a penalty of twenty shillings Scots on every person absent from his own church. They offered violence to none, and went away without entering the manse, being assured that no strangers were there. When they were gone, the minister assembled the remains of the congregation in his own house, and finished the sermon, 'standing on the stairhead, both the upper and lower flat being crowded to the full.'

"The people seemed very loath to depart, lingering in suspense about the door, expressing their concern for his safety, and their willingness to shed their blood in his defence. Mr. Blackadder conjured them to have regard to the peace of the country, and give no handle to their adversaries by any disturbance. 'Go,' said he, 'and fend [*providè*] for yourselves: the hour is come when the shepherd is smitten, and the flock shall be scattered. Many are this day mourning for the desolations of Israel, and weeping, like the prophet, between the porch and the altar. God's heritage has become the prey of the spoiler; the mountain of the house of the Lord as the high places of the forest. When the faithful pastors are removed, hirelings shall intrude, whom the great Shepherd never sent, who will devour the flock, and tread down the residue with their feet. As for me, I have done my duty, and now there is no time to evade. I recommend you to Him who is able to keep you from falling, and am ready, through grace, to be disposed of as the Lord pleases."¹

After this solemn and affecting scene Mr. Blackadder went, with his wife and numerous family, to reside at Caitloch, in the parish of Glencairn, a wilder and more central part of the stewartry of Kirkcudbright. Here he soon attracted the attention of the authorities by the crowds which he col-

lected to hear his occasional preachings, and he was therefore obliged to remove. For some years after this period he appears to have wandered through the country, preaching whenever he could find a proper opportunity. In 1670, having performed worship at a conventicle near Dunfermline, where the people had armed themselves for self-defence, he was summoned before the privy council, but contrived to elude their power. When the search was a little slackened he renewed his practice of itinerant preaching, which he not only conceived to be no offence against human laws, but a duty solemnly enjoined by the word of God. On one occasion he preached at Kinkell, near St. Andrews: the people flocked from that metropolitan city to hear him, notwithstanding all the injunctions and *surveillance* of Archbishop Sharpe. It is said that, on Sharpe desiring the provost to send out the militia to disperse the congregation, he was informed that it was impossible—the militia had gone already as worshippers. In 1674 Blackadder was outlawed, and a reward of 1000 merks was offered for his apprehension; but he nevertheless continued to preach occasionally to large assemblages in the fields. What may appear surprising, he often resided in the capital, without undergoing any annoyance, and contrived, notwithstanding the migratory nature of his life, to rear a large and well-instructed family. It does not appear that he approved of the insurrection of his friends which was suppressed at Bothwell. Though engaged in duty immediately before this event, he fortunately was confined during the whole period of its continuance by a rheumatism, and therefore escaped all blame on that account. In 1680 he made a voyage to Holland, and settled his son at Leyden as a student of medicine, a circumstance which proves that the persecution to which these clergymen were subjected was not uniformly attended by pecuniary destitution. After spending several months in Holland, he returned to Scotland, and, in the succeeding year, was apprehended, and confined in the state-prison upon the Bass. He remained here for four years, when at length his health declined so much, on account of the insalubrious nature of his prison, that his friends made interest to procure his liberation upon the plea that he must otherwise sink under his malady. The government at first mocked him with a proposal to transfer him to Haddington or Dunbar jail, but at length, on a more earnest and better-attested remonstrance, offered to give him liberty to reside in Edinburgh, under a bond for 5000 merks. Ere this tender mercy could be made available, he died in his islet prison, December, 1685, having nearly completed his seventieth year. John Blackadder lies interred in North Berwick churchyard, where there is an epitaph to his memory, containing, among others, the following characteristic lines:—

"Grace formed him in the Christian hero's mould;
Meek in his own concerns—io's Master's bold;
Passions to reason chained, prudence did lead,
Zeal warmed his breast, and prudence cooled his head.
Five years on this lone rock, yet sweet abode,
He Enoch-like enjoyed and walked with God;
Till by long-living on his heavenly food,
His soul by love grew up, too great, too good,
To be confined to jail, or flesh, or blood."²

BLACKLOCK, THOMAS, an ingenious blind poet, was born, November 10th, 1721, at Annan; his parents were natives of Cumberland; his father a bricklayer, and his mother the daughter of Mr. Richard Rae, an extensive cattle-dealer. Before he was six months old he lost his sight in the small-pox; and was thus rendered incapable of learning a

¹ Crichton's *Life of John Blackadder*, 12mo, 1823.

mechanical trade, while the poor circumstances to which a series of misfortunes had reduced his father, placed equally beyond his reach an education for any of those professions where the exercise of the mental faculties is principally required. His affectionate parent, aware, however, that the happiness of his son, shut out from the external world, must mainly depend upon his intellectual resources, devoted part of his leisure hours to such instruction as his poor blind boy was susceptible of—he read to him, at first the books adapted to the understanding of a child, and afterwards those fitted for a maturer capacity, such as Milton, Spenser, Prior, Pope, and Addison. His companions also, who pitied his want of sight, and loved him for his gentle disposition, lent their assistance in this task of kindness; and by their help he acquired some little knowledge of Latin. Thomson and Allan Ramsay were his favourite authors; and it was as early as his twelfth year that he evinced still more decidedly his love of the poetical art by the composition of an ode, addressed "To a little girl whom I had offended."

Thus early did Blacklock show, that in the course of reading chosen for him, his father had not mistaken the bent of his inclination. But though, as we have mentioned, some of his comrades delighted to forward his favourite studies, and, by their assiduous attentions, to make him forget the deprivation under which he laboured, there were others who took pleasure in rendering him bitterly conscious of his misfortune, and exulted in the success of such practical jokes as it was easy to make him the subject of. It is but too obvious that his own experience at this period, when exposed to the insults of unfeeling boys, suggested the reflection introduced in the article "Blind," afterwards written by him for the *Encyclopedia Britannica*: "Parents of middle or of higher rank," he there remarks, "who are so unfortunate as to have blind children, ought by all possible means to keep them out of vulgar company. The herd of mankind have a wanton malignity which eternally impels them to impose upon the blind, and to enjoy the painful situations in which these impositions place them. This is a stricture upon the humanity of our species, which nothing but the love of truth and the dictates of benevolence could have extorted from us. But we have known some," he adds, evidently referring to himself, "who have suffered so much from this diabolical mirth in their own persons, that it is natural for us, by all the means in our power, to prevent others from becoming their victims."

Blacklock lived at home till his nineteenth year, when a fresh misfortune overtook him in the loss of his father, who was crushed to death by the fall of a malt-kiln. To his keenly susceptible mind this stroke must therefore have been peculiarly afflicting. And it was attended not only with regret on account of remembered benefits, but also by the anticipation of future evils. A means of livelihood was indeed suggested by Blacklock's love of music: as he played well on the violin and flute, and even composed pieces with taste, it was proposed that he should follow this art as a profession. "But the unhappy situation in which he was then placed," says the authority upon which this statement is given,¹ "made him dread consequences to which he could never reconcile his mind. The very thought that his time and talents should be prostrated to the forwarding of loose mirth and riot inspired him with an honest indignation." Although gloomy anticipations like

these sometimes intruded, Blacklock did not permit them to overwhelm him, but calming his fears, and resting with a pious confidence in the awards of a protecting Providence, he continued to live with his mother for a year after his father's death.

Some of his poems had by this time got abroad, by which the fame of Blacklock's genius was extended; and at last it reached a gentleman, who to curiosity added benevolence of heart. This was Dr. John Stevenson, a physician in Edinburgh, who, while on a professional visit in Dumfries, saw some of our author's pieces, and resolved to afford the young man's talents the opportunity of expanding in avocations and amid society more congenial to one so much restricted to pleasures of an intellectual kind. Accordingly Blacklock was, in 1741, induced to remove to the metropolis, where he attended a grammar-school for some time, and afterwards entered as a student in the college, Dr. Stevenson supplying him with the means necessary for the prosecution of his studies.

These studies were interrupted by the expedition of the Highlanders in 1745; and during the distractions consequent upon that memorable campaign Blacklock resided in Dumfries with Mr. M'Murdo, his brother-in-law. On the re-establishment of peace he returned to college, and studied six years more. In this period he acquired a good knowledge of all those branches of education where he was not hindered by the want of sight; and became better skilled than was common in the French language, from being on habits of intimacy with the family of Provost Alexander, whose wife was a Parisian. It may well inspire wonder that latterly there was no science with which Blacklock had not made himself acquainted—no learned language which he did not master—and no modern tongue of any acknowledged use to a man of general literature, with which he was not more or less familiar.

Amid the severer studies of classical learning, philosophy, and theology, his attachment to poetry was not forgotten. In 1746 a volume of his verses in 8vo was published at Glasgow. A second edition followed at Edinburgh in 1754; and two years afterwards, a quarto edition, with an account of his life by Mr. Spence, professor of poetry at Oxford, came out by subscription in London. In the selection of pieces for the press Blacklock was by his friends considered to be over-fastidious; and by persisting to exclude what he himself thought unworthy of a place, he greatly limited the size of his books. By the London edition a considerable sum was realized for the author's advantage. Besides these editions of his poems, another in 4to was published in 1793, with a life elegantly written by Henry Mackenzie.

Hume the historian was among the friends who early interested themselves in the fortunes of Blacklock, and was of considerable service in promoting the subscription to the London edition of his poems; but all intercourse between them was subsequently broken off.

The course of study followed by Blacklock at college was that usually gone through for the purpose of entering upon the ministry; but it was not till after the abandonment of a project (which he began to entertain in 1757, and from which he was dissuaded by Mr. Hume, after making considerable preparations towards it) for delivering lectures on oratory, that he finally adopted the resolution of becoming a clergyman. Having applied himself for some time exclusively to the necessary studies, he was licensed as a preacher by the presbytery of Dumfries in 1759. He soon acquired considerable reputation as a pulpit orator, and took great delight

¹ An article in the *Gentleman's Magazine*, reprinted in the *Scots Magazine* for 1754.

in composing sermons, a considerable number of which he left behind him: these it was at one time the intention of his friends to publish; but for some reason or other this has never been done.

The Rev. Mr. Jameson, Blacklock's intimate companion, to whom allusion is more than once made in his poems, has given the following account of his habits about this time:

"His manner of life was so uniform, that the history of it during one day, or one week, is the history of it during the seven years that our intercourse lasted. Reading, music, walking, conversing, and disputing on various topics, in theology, ethics, &c., employed almost every hour of our time. It was pleasant to hear him engaged in a dispute; for no man could keep his temper better than he always did on such occasions. I have known him frequently very warmly engaged for hours together, but never could observe one angry word to fall from him. Whatever his antagonist might say, *he* always kept his temper,—'*semper paratus, et refellere sine pertinacia, et refelli sine iracundia.*' He was, however, extremely sensible to what he thought ill usage, and equally so whether it regarded himself or his friends. But his resentment was always confined to a few satirical verses, which were generally burned soon after. The late Mr. Spence (the editor of the 4th edition of his poems) frequently urged him to write a tragedy, and assured him that he possessed interest enough with Mr. Garrick to get it acted. Various subjects were proposed to him, several of which he approved, yet he never could be prevailed on to begin anything of that kind. It may seem remarkable, but, as far as I know, it was invariably the case, that he never could think or write on any subject proposed to him by another. I have frequently admired with what readiness and rapidity he could make verses. I have known him dictate from thirty to forty verses, and by no means bad ones, as fast as I could write them; but the moment he was at a loss for a rhyme or a verse to his liking, he stopped altogether, and could very seldom be induced to finish what he had begun with so much ardour."

"All those who ever acted as his amanuenses," says Mackenzie, "agree in this rapidity and ardour of composition which Mr. Jameson ascribes to him. He never could dictate till he stood up; and as his blindness made walking about without assistance inconvenient or dangerous to him, he fell insensibly into a vibratory sort of motion of his body, which increased as he warmed with his subject, and was pleased with the conceptions of his mind. This motion at last became habitual to him; and though he could sometimes restrain it when on ceremony, or in any public appearance, such as preaching, he felt a certain uneasiness from the effort, and always returned to it when he could indulge it without impropriety. This is the appearance which he describes in the ludicrous picture he has drawn of himself:

'As some vessel tossed by wind and tide
Bounds o'er the waves, and rocks from side to side,
In just vibration thus I always move."

Much of the singularity in the gestures of poor Blacklock must have proceeded from his inability to observe the carriage of others, and to regulate his own in conformity with theirs. The author of *Douglas*, in one of his letters, has given a curious picture of his singular appearance when under strong excitement: "I went to a companion's," says Home, "and sent for the blind poet, who is really a strange creature to look at—a small weakly under thing—a chilly, bloodless animal, that shivers at every breeze. But if nature has cheated him in one re-

spect, by assigning to his share forceless sinews, and a ragged form, she has made him ample compensation on the other, by giving him a mind endowed with the most exquisite feelings—the most ardent, kindled-up affections; a soul, to use a poet's phrase, that's tremblingly alive all over: in short, he is the most flagrant enthusiast I ever saw; when he repeats verses, he is not able to keep his seat, but springs to his feet, and shows his rage by the most animated motions. He has promised to let me have copies of his best poems, which I will transmit to you whenever he is as good as his word."

In 1762 the Earl of Selkirk procured for the crown a presentation to the parish of Kirkcudbright in favour of Mr. Blacklock; who, having thus the prospect of a competent income, married Mrs. Sarah Johnston, daughter of Mr. Joseph Johnston, surgeon in Dumfries. But though not disappointed in the happiness he expected to derive from this union, the gleam of fortune which seems to have induced him to form it, forsook him immediately after the step was taken. He was ordained a few days after his marriage; but the people of the parish refused, on account of his blindness, to acknowledge him as their pastor, and a lawsuit was commenced, which, after two years, was compromised by Blacklock retiring upon a moderate annuity. It is probably to the period when he experienced so determined an opposition from the people of Kirkcudbright, that we are to refer the composition of his *Paracletis*; for he informs us in the preface that his motive for writing that work was "to alleviate the pressure of repeated disappointments, to soothe his anguish for the loss of departed friends, to elude the rage of implacable and unprovoked enemies,—in a word, to support his own mind, which, for a number of years, besides its literary difficulties and its natural disadvantages, had maintained an incessant conflict with fortune." At no other period but that above referred to, are we aware that Blacklock was the object of anything like an angry feeling.

In 1764, after the connection between him and the parish of Kirkcudbright was dissolved, Blacklock removed to Edinburgh, where he received boarders into his house,¹ superintending the studies of those who chose to have such assistance. "In this occupation," says Mackenzie, "no teacher was perhaps ever more agreeable to his pupils, nor master of a family to its inmates, than Dr. Blacklock. The gentleness of his manners, the benignity of his disposition, and that warm interest in the happiness of others which led him so constantly to promote it, were qualities that could not fail to procure him the love and regard of the young people committed to his charge; while the society which esteem and respect for his character and his genius often assembled at his house, afforded them an advantage rarely to be found in establishments of a similar kind. The writer of this account has frequently been a witness of the family scene at Dr. Blacklock's; has seen the good man amidst the circle of his young friends, eager to do him all the little offices of kindness which he seemed so much to merit and to feel. In this society he appeared entirely to forget the privation of sight, and the melancholy which, at other times, it might produce. He entered with the cheerful playfulness of a young man into all the sprightly narrative, the sportful fancy, the humorous jest, that rose around him."

In these hours of social relaxation Blacklock found

¹ He occupied the two upper flats of a house at the west end of West Nicolson Street, looking towards St. Cuthbert's Chapel of Ease burying-ground.

one of the greatest pleasures of his existence. Music also afforded him a lively gratification; for he sung with taste, and performed tolerably well on several instruments, particularly on the flute. He had learned to play on the flageolet in consequence of a dream in which he supposed himself to listen to the most enchanting melody, produced by a shepherd on a hillside from that instrument; and he always carried one in his pocket, on which he was by no means averse from being asked to perform—"a natural feeling," says Mackenzie, "for a blind man, who thus adds a scene to the drama of his society." We have already alluded to his skill in composition, which was begun early at least, if it was not very assiduously cultivated. There is a specimen of his abilities in this way in the *Edinburgh Magazine and Review* for 1774, under the title of "Absence, a Pastoral, set to music by Dr. Blacklock."

Finding that his increasing years and infirmities required repose, Dr. Blacklock discontinued the keeping of boarders in 1787. But though his bodily vigour began to fail, he experienced no diminution of that benevolence which had ever characterized him. His own genius having been greatly indebted to patronage, he was ever ready to acknowledge it in others, and especially to cultivate and bring it into reputation where he found it struggling with obscurity. Nor were his efforts for this purpose confined to occasional acts of liberality—they were laborious and long-continued. He had taken a boy from a village near Carlisle to lead him, and perceiving in the youth a willingness to learn, taught him Latin, Greek, and French, and having thus fitted him for a station superior to that in which he was born, procured for him the situation of secretary to Lord Milton, who was chief active manager of state affairs in Scotland for many years. This young man was Richard Hewitt, known to the admirer of Scottish song as the author of *Roslin Castle*. Hewitt testified his gratitude to his instructor by a copy of complimentary verses, in every line of which may be traced the chief excellence of compositions of that description—sincerity; but he did not long enjoy his change of fortune, having died in 1764 from the fatigue of the office to which he had been elevated.

But we find a still more eminent example of Blacklock's solicitude to promote the interests of the sons of genius, in his being the first man among the literary circles of Edinburgh who appreciated the poetry of Burns (perhaps, indeed, because he had the earliest opportunity of becoming acquainted with it), and kindled in the author the ambition of a prize beyond that of provincial fame. The Rev. Mr. Lawrie of Newmills had transmitted to Blacklock a copy of the Kilmarnock edition of Burns' poems. It is not easy for a modern reader to understand with what wonder and delight Blacklock must have heard them read. With calmness, yet with energy, the enthusiastic Blacklock indicated his own admiration and the certainty of the poet's future fame:—"Many instances," he wrote to Mr. Lawrie, "have I seen of nature's force and beneficence exerted under numerous and formidable disadvantages; but none equal to that with which you have been kind enough to present me. There is a pathos and delicacy in his serious poems, a vein of wit and humour in those of a more festive turn, which cannot be too much admired nor too warmly approved. I think I shall never open the book without feeling my astonishment renewed and increased.—It were much to be wished, for the sake of the young man, that a second edition, more numerous than the former, could immediately be printed; as it appears certain that its intrinsic merit, and the exertion of the author's

friends, might give it a more universal circulation than anything of the kind which has been published within my memory."—"I had taken the last farewell of my few friends," says Burns; "my chest was on the road to Greenock; I had composed the last song I should ever measure in Scotland—"The Gloomy night is gathering fast"—when a letter from Dr. Blacklock to a friend of mine overthrew all my schemes, by opening new prospects to my poetic ambition. The doctor belonged to a set of critics for whose applause I had not dared to hope. His opinion that I would meet with encouragement in Edinburgh for a second edition, fired me so much, that away I posted for that city, without a single acquaintance, or a single letter of introduction."—"Blacklock received him," says Dr. Currie, "with all the ardour of affectionate admiration; he eagerly introduced him to the respectable circle of his friends; he consulted his interest; he emblazoned his fame; he lavished upon him all the kindness of a generous and feeling heart, into which nothing selfish or envious ever found admittance."—"In Dr. Blacklock," Burns himself writes to Mr. Lawrie, "in Dr. Blacklock, whom I see very often, I have found what I would have expected in our friend,—a clear head and an excellent heart." It is not our business, in this place, to trace Burns' career farther. Dr. Blacklock's duty towards him was performed when he had bestowed upon him every mark of private regard, and consigned him to the care of more influential patrons.

Besides the miscellaneous poems by which Dr. Blacklock is best known as an author, he published several other works. In 1756 he gave to the world an *Essay towards Universal Etymology*; in 1760, *The Right Improvement of Time, a Sermon*; in the ensuing year another sermon, entitled *Faith, Hope, and Charity compared*. In 1767 appeared his *Paraclesis; or, Consolations deduced from Natural and Revealed Religion*, in two dissertations, the first supposed to be Cicero's, translated by Dr. Blacklock,—the other written by himself. This work, to use the author's own touching words, "was begun and pursued by its author to divert wakeful and melancholy hours, which the recollection of past misfortunes, and the sense of present inconveniences, would otherwise have severely embittered." He endeavours, but without success, to prove the authenticity of the dissertation ascribed to Cicero, which he has translated with fidelity and elegance: the object of the original discourse is to prove the superiority of the consolations afforded by revealed religion. In 1768 he printed *Two Discourses on the Spirit and Evidences of Christianity*, translated from the French of Mr. James Armand. To this work he prefixed a long dedication to the moderator of the General Assembly. In 1773 appeared his *Panegyric on Great Britain*, which shows him to have possessed considerable talents for satire had he chosen to pursue that species of writing. His last production was in 1774, *The Graham, an Heroic Ballad, in Four Cantos*; intended to promote a good understanding between the natives of England and Scotland. He contributed to the *Encyclopaedia Britannica*, in 1783, the article "Blind"—a little treatise of peculiar interest. He is also said to have written the "Essay on Poetry," and others on various subjects in the same work. Dr. Blacklock left behind him in manuscript some volumes of sermons, and a treatise on morals.

In his latter years our author was occasionally afflicted with deafness—in his case a double calamity, as at the periods when it visited him, he was in a manner shut out from all communication with the external world. In this forlorn condition—old,

blind, and sometimes deaf—it was more difficult for him than formerly to bear up against the depression of spirits to which he had always been more or less subject; but his gentleness of temper never forsook him, and though he could not altogether avoid complaint, he was not loath to discover and state some alleviating circumstance along with it. He died from fever after a week's illness, on the 7th July, 1791, and was buried in the ground of St. Cuthbert's chapel of ease, where there is a tombstone erected, with the following inscription by Dr. Beattie:—"Viro Reverendo Thomæ Blacklock, D.D. Probo, Pio, Benevolo, Omnigenâ Doctrinâ Erudito, Poetæ sublimi; ab incunabulis usque oculis capto, at hilari, faceto, amicusque semper carissimo; qui natus XXI Novemb. MDCCXX. obiit VII Julii, MDCCXCI: Hoc Monumentum Vidua ejus Sara Johnston, mœrens P."

It has been said of Dr. Blacklock, that "he never lost a friend, nor made a foe;" and perhaps no literary man ever passed through life so perfectly free from envious feeling, and so entirely respected and beloved. His conversation was lively and entertaining; his wit was acknowledged, but it had no tinge of malice; his temper was gentle, his feelings warm—intense; his whole character was one to which may be applied the epithet amiable, without any qualification.

To Dr. Blacklock as a poet, the rank of first-rate excellence has not been assigned, and is not claimed; but his works possess solid merits, which will always repay a perusal. The thoughts are, for the most part, vigorous, seldom less than just; and they are conveyed with a certain intensity of expression, which shows them, even when not uncommon in themselves, to be the offspring of a superior genius.

BLACKWELL, ALEXANDER AND ELIZABETH, husband and wife. The former was brother to the more celebrated Dr. Thomas Blackwell, the subject of the following article. His father, Thomas Blackwell, was at first minister of Paisley, whence he was removed, in 1700, to be one of the ministers of Aberdeen. He was there appointed to be professor of divinity in the Marischal College, and afterwards, in 1717, raised by the crown to the rank of principal, which he held till his death in 1728. Alexander, his son, exhibited at an early period such symptoms of genius as induced his father to employ great personal care in his education. At fifteen he was a perfect Greek and Latin scholar, and he afterwards distinguished himself very highly at college. It would appear that his union to Elizabeth Blackwell, who was the daughter of a merchant at Aberdeen, took place under clandestine circumstances, and was connected with a step which gave a direction to all his future fortunes. This was a secret elopement to London, where he arrived before any of his friends knew where he was. Blackwell appears to have been a man of mercurial and adventurous temperament; possessing, with these qualities, exactly that degree of ability and accomplishment which has enabled so many of his countrymen to prosecute a successful career in London. His first employment was that of corrector of the press to Mr. Wilkins, an eminent printer. Afterwards, he was enabled to set up as a printer on his own account, and for this purpose he occupied a large house in the Strand. But he did not long pursue this business before an action was brought against him for not having served a regular apprenticeship to it. The unsuccessful defence of this action ruined him, and one of his creditors threw him into jail, where he remained two years.

Hitherto we hear nothing of his wife—and,

perhaps, but for the misfortunes of the husband, the virtues of this noble woman might have only decorated a private station. Like the flower, however, which blooms most by night, the better quality of woman's nature is chiefly developed under the cloud of sorrow; and it is only when the powers of man have been prostrated, or found of no avail, that her weakness shines forth in its real character—latent strength. Elizabeth Blackwell happened to possess a taste for drawing flowers;—a taste then so very rare, that there was hardly any engraved work in existence containing representations of this interesting department of creation. The acknowledged want of a good herbal occurred to her as affording the means of exerting this gift in a useful way; and some of her first attempts being submitted to Sir Hans Sloane, Dr. Mead, and other eminent physicians, she soon received sufficient encouragement to proceed in her work. A document, attesting their satisfaction with Mrs. Blackwell's specimens, and recommending her contemplated work to public attention, was signed by six eminent physicians, including these gentlemen, and bears date "October 1, 1735." By the advice of Mr. Rand, an eminent apothecary, demonstrator to the Company of Apothecaries in the botanic garden at Chelsea, Mrs. Blackwell hired a house near that establishment, where she had an opportunity of receiving the necessary flowers and plants in a fresh state, as she wanted them; she also received great encouragement and assistance from Mr. Philip Miller, so well known for his publications connected with horticulture.

Mrs. Blackwell not only made drawings of the flowers, but she also engraved them on copper, and coloured the prints with her own hands. Her husband lent all the aid in his power, by attaching the Latin names of the plants, together with a short account of their principal characters and uses, chiefly taken, by permission, from Miller's *Botanicum Officinale*. The first volume of the work appeared in 1737, in large folio, containing two hundred and fifty-two plates, each of which is occupied by one distinct flower or plant, and was dedicated to Dr. Mead, with the following address: "As the world is indebted to the encouragers of every public good, if the following undertaking should prove such, it is but justice to declare who have been the chief promoters of it; and as you were the first who advised its publication, and honoured it with your name, give me leave to tell the readers how much they are in your debt for this work, and to acknowledge the honour of your friendship." The second volume, completing the number of plates to five hundred, appeared in 1739, and was inscribed to Mr. Rand, in an address breathing as fervent a spirit of gratitude, and acknowledging that, in her own ignorance of botany, she was entirely obliged to him for the completeness of the work, so far as it went. The drawings are in general faithful; and if there is wanting that accuracy which modern improvements have rendered necessary in delineating the more minute parts, yet, upon the whole, the figures are sufficiently distinctive of the subjects. The style of the engravings is what would now be called *hard*, but it is fully on a level with the prevailing taste of the age; and, as a piece of labour, executed, it would appear, in the space of four years, by the hands of one woman, the whole work is entitled alike to our wonder and admiration. While Mrs. Blackwell was proceeding in her task, she attracted the attention of many persons of eminent rank and character, and also a great number of scientific persons, who visited her at Chelsea, and afforded her many marks of kindness. On the completion of the first volume,

she was permitted in person to present a copy to the College of Physicians, who acknowledged her extraordinary merit by a handsome present, as well as a testimonial, under the hands of the president and censors of the institution, characterizing her work as "most useful," and recommending it to the public. It seems to have been at this period of her labours, that, after having all along supported her family by her own exertions, she was enabled to redeem her husband from confinement.

Blackwell, after his release, lived for some time at Chelsea with his wife, and, on her account, was much respected. He attempted to perfect himself in the study of physic, and also formed schemes for the improvement of waste lands. This latter subject he studied to such a degree, as to be enabled to write an agricultural treatise, which attracted some attention. Among his other occupations for some time, was a prosecution which he entered into against some print-sellers, for pirating his wife's botanical plates. By his success in this affair, he revenged in some measure the persecution to which he had been subjected for his inadvertent breach of another exclusive law. His agricultural knowledge gradually became known, and he was often consulted on difficult points connected with that science, and received handsome fees for his trouble. At one time he was employed by the Duke of Chandos in superintending some agricultural operations at Cannous. His work on agriculture, which was published at this time, recommended him to the attention of a still higher patronage—the Swedish ambassador, who, having transmitted a copy to his court, was directed to engage the author, if possible, to go to Stockholm. Blackwell accepted this engagement, and sailed for the Swedish capital, leaving his wife and one child in England, with a promise that he would soon send for them. He was received in the kindest manner at the court of Stockholm, was lodged in the house of the prime minister, and was allowed a pension. The King of Sweden happening soon after to be taken dangerously ill, Blackwell was permitted to prescribe for him, and had the good fortune to effect a cure. He was consequently appointed one of the king's physicians, and styled doctor, though it does not appear that he ever took a degree in medicine. While enjoying all this good fortune, he was not forgetful of his wife, but sent her several sums of money, and she was on the point of sailing to join him at Stockholm, when all his prospects, and life itself, were overwhelmed at one blow. It is probable, from the character of his brother Thomas, that he was a fervent admirer of the principles of civil liberty. Nothing, moreover, can be more probable than that a man, accustomed to all the freedom of speech which is so harmlessly permitted in Britain, might not very readily accommodate himself to that prudence of the tongue which is demanded from the subjects of an arbitrary monarchy. It is at least certain that he was apprehended on suspicion of being connected with a plot which had been formed by one Count Tessin, for overturning the constitution of the kingdom, and altering the line of succession. Being put to the torture, he is alleged to have confessed a concern in this conspiracy. Every reader, however, will acknowledge, that confessions under the torture form historical documents of a very questionable nature. Being tried for his supposed offence before a royal commission, he was sentenced to be broken alive on the wheel, and put to the death of a traitor. In the course of his trial some imputations were thrown upon his Britannic Majesty, for which, in conjunction with other circumstances, the British ambassador

was recalled from Stockholm. The unfortunate Blackwell was executed, July 29th, 1747, but not, it would appear, with the tortures assigned by his sentence. On the scaffold he protested to the people his entire innocence of the crimes laid to his charge, and, as the best proof of what he stated, pointed out his utter want of all motive for engaging in an attempt against the government. He prayed with great devotion; but happening to lay his head wrong upon the block, he remarked good-humouredly, that, as this was his first experiment, no wonder he required a little instruction.¹ The date of Mrs. Blackwell's death is not ascertained. Her work was afterwards republished on the Continent.

BLACKWELL, THOMAS, the restorer of Greek literature in the north of Scotland, and a learned writer of the eighteenth century, was brother to the subject of the preceding article. He was born at Aberdeen, August 4th, 1701, and after receiving the rudiments of his education at the grammar-school of his native city,² entered his academical course at the Marischal College, where he took the degree of A. M. in 1718. A separate professorship of Greek had not existed in this seminary previous to 1700, and the best of the ancient languages was at that period very little cultivated in Scotland. Blackwell, having turned his attention to Greek, was honoured, in 1723, when only twenty-two years of age, with a crown appointment to this chair. He entered upon the discharge of the duties of his office with the utmost ardour. It perfectly suited his inclination and habits. He was an enthusiastic admirer of the language and literature of Greece, and the whole bent of his studies was exclusively devoted to the cultivation of polite learning. He had the merit of rearing some very eminent Greek scholars, among whom may be mentioned Principal George Campbell, Dr. Alexander Gerard, and Dr. James Beattie. The last has borne ample testimony to the merit of his master in his *Essay on the Utility of Classical Learning*, where he styles Principal Blackwell "a very learned author."

Dr. Blackwell first appeared before the public as an author in 1737. His *Inquiry into the Life and Writings of Homer* was published at London during the course of that year, but without his name. It

¹ Soon after the death of Blackwell appeared *A Genuine Copy of a Letter from a Merchant in Stockholm, to his Correspondent in London*, "containing an impartial account of Dr. Alexander Blackwell, his plot, trial, character, and behaviour, both under examination and at the place of execution, together with a copy of a paper delivered to a friend upon the scaffold, in which he denied the crime imputed to him." This publication does not appear to have been genuine, and as it contains some particulars of the life of Blackwell totally at variance with the above more authentic and probable account, which is chiefly derived from a letter signed G. J. and dated from Bath, in the *Gentleman's Magazine* for 1747, we have entirely rejected it. This spurious work is, nevertheless, chiefly used by Mr. Nichols, in an account of Blackwell given in the *Literary Anecdotes of the Eighteenth Century*.

² The history of the origin of what are technically, in Scotland, denominated *grammar-schools*, is involved in considerable obscurity. The probability is, that they were in most cases founded by generous individuals, who wished well to the cause of literature, and who, to secure that proper care should be taken in the management of the funds by which the establishment was supported, vested the money appropriated for that purpose in some public body or corporation. It does not admit of a doubt, that this took place in several of the principal Scottish burghs; but it is very singular, that those schools were limited to the Latin language alone. This proceeded from the dread that there was a design in the founders of such seminaries to supersede universities, where Latin, Greek, and Hebrew were taught. The grammar-school of Aberdeen was founded by Dr. Patrick Dun, principal of Marischal College, who was a native of the city, and had resided at Padua, where he took his degree of Doctor of Medicine.

has been positively affirmed, with what truth it is impossible to say, that its being anonymous was in imitation of Lord Shaftesbury, of whom he was a warm admirer, and whose works were published after that manner. The style, also, is vitiated by a perpetual effort at the Shaftesburian vein, which is, perhaps, the principal fault in the writings of Blackwell. A second edition of the work appeared in 1746, and shortly after, *Proofs of the Inquiry into Homer's Life and Writings*. These proofs chiefly consisted of a translation of the Greek, Latin, Spanish, Italian, and French notes subjoined to the original work. The *Inquiry* contains a great deal of research, as well as a display of miscellaneous learning. Perhaps its principal defect consists in the author's discovering an over-anxiety in regard to both; at least, he has not been sufficiently careful to guard against the imputation of sometimes going out of his way to show what labour he had bestowed in examining every source of information, both ancient and modern, foreign and domestic. Though the life of Homer has been written by Herodotus, by Plutarch, and by Suidas, among the Greeks, and by an innumerable host of writers scattered through other nations, yet there is hardly one point in his history about which they are agreed, excepting the prodigious merit of his poems, and the sophist Zoilus would not even grant this. How great uncertainty prevailed respecting the time and place of his birth, abundantly appears from seven Grecian cities contending in regard to the latter point. When the field was so extensive, and so great diversity of opinion prevailed, it cannot fail to be perceived how arduous an enterprise Dr. Blackwell had undertaken. His criticisms on the poems themselves are always encomiastic, often ingenious, and delivered in language that can give no reasonable ground of offence. The work will be read with both pleasure and profit by all who are prepared to enter upon such inquiries. It is generally esteemed the best of his performances.

He published, in 1748, *Letters concerning Mythology*, without his name also. In the course of the same year he was advanced to be principal of his college, succeeding Dr. John Osborne, who died upon the 19th of August. Dr. Blackwell, however, was not admitted to the exercise of his new office till the subsequent 9th of November. The first object of his attention respected the discipline of the college. Great irregularities had crept into the institution, not in his predecessor's time only, but probably almost from its foundation. Through the poverty of the generality of the students in those days, their attendance, short as the session was allowed to be, was very partial; to correct this he considered to be indispensably necessary. Accordingly, about the middle of October, 1749, previous to the commencement of the session, an advertisement in the public papers informed the students that a more regular attendance was to be required. This, it would appear, did not produce the intended effect. Accordingly, to show that the principal and professors were perfectly in earnest when they gave this public notice, three of the bursars, who had not complied with the terms of the advertisement, were, on the 10th of November, expelled. This decision gave general satisfaction, and indeed deserved high commendation.

But, that the professors themselves might be more alert and attentive to their duty, he revived a practice which, it is likely, had at an early period been common, for every professor in the university to deliver a discourse in the public school upon some subject connected with his profession. He himself

set the example, and delivered his first oration upon the 7th of February, 1749. When Blackwell was promoted to the principality, instead of sinking into indolence, he seems to have considered it rather as affording an excitement to exertion. In February, 1750, he opened a class for the instruction of the students in ancient history, geography, and chronology. Prelections on these branches of education he thought necessary to render more perfect the course at Marischal College. He, therefore, himself undertook the task. The design of his opening this class evidently was to pave the way for the introduction of a new plan of teaching into Marischal College, which, accordingly, he soon after accomplished. At the commencement of the session 1752, public notice was given that "the principal, professors, and masters, having long had under their consideration the present method of academical education, the plan of which, originally introduced by the scholastic divines in the darkest times, is more calculated for disputes and wrangling than to fit men for the duties of life, therefore have resolved to introduce a new order in teaching the sciences." The order which was then adopted, is what still continues in force in that university. Three years afterwards, when the new plan had been put to the trial for as many sessions, the faculty of the college ordered an account of the plan of education which was followed to be printed. This formed a pamphlet of thirty-five pages. It concludes thus:—"They have already begun to experience the public approbation by the increase of the number of their students." So that he had the agreeable pleasure of witnessing the success of the plan he had proposed.

In 1752 he took the degree of Doctor of Laws, and in the subsequent year was published, in quarto, the first volume of *Memoirs of the Court of Augustus*. A second volume appeared in 1755, and a third, which was posthumous, and left unfinished by the author, was prepared for the press by John Mills, Esq., and published in 1764. In this work the author has endeavoured to give an account of Roman literature as it appeared in the Augustan age, and he has executed the task with no small share of success. Objections might easily be started to some of his theories and opinions, but every classical scholar who is fond of literary history will peruse the work with pleasure as well as profit.

Dr. Blackwell died at Edinburgh, upon the 6th of March, 1757. He was certainly a very extraordinary person, and like every man of acknowledged talents, formed a very general subject of conversation. He was formal, and even pompous. His dress was after the fashion of the reign of Queen Anne. The portly mien and dignified manner in which he stepped through the public school, impressed all the students with a deep sense of his professional importance. He was, nevertheless, kind and indulgent to them, and of a benevolent disposition. He left a widow, but no children. Mrs. Blackwell, in 1793, founded a chemical professorship in Marischal College, and appointed a premium of ten pounds sterling to be annually bestowed on the person who should compose, and deliver, in the English language, the best discourse upon a given literary subject.

BLACKWOOD, ADAM, a learned writer of the sixteenth century, was born at Dunfermline, in 1530. He was descended from an ancient and respectable family; his father, William Blackwood, was slain in battle ere he was ten years of age (probably at Pinkie-field); his mother, Helen Reid, who was niece to Robert Reid, Bishop of Orkney, died soon after, of grief for the loss of her hus-

band. By his uncle, the bishop, he was sent to the university of Paris, but was soon obliged to return, on account of the death of his distinguished relation. Scotland, at this time, was undergoing the agonies of the reformation, under the regency of Mary of Lorraine. Blackwood found it no proper sphere for his education; and therefore soon returned to Paris, where, by the liberality of his youthful sovereign, Queen Mary, then residing at the court of France, he was enabled to complete his studies, and to go through a course of civil law at the university of Toulouse. Having now acquired some reputation for learning and talent, he was patronized by James Beaton, the expatriated Archbishop of Glasgow, who recommended him very warmly to Queen Mary and her husband, the Dauphin, by whose influence he was chosen a member of the parliament of Poitiers, and afterwards appointed to be professor of civil law at that court.

Poitiers was henceforth the constant residence of Blackwood, and the scene of all his literary exertions. His first work was one entitled, *De Vinculo Religionis et Imperii, Libri Duo*, Paris, 1575, to which a third book was added in 1612. The object of this work is to show the necessity under which rulers are laid, of preserving the true—i.e. the Catholic—religion from the innovations of heretics, as all rebellions arise from that source. Blackwood, by the native tone of his mind, the nature of his education, and the whole train of his associations, was a faithful adherent of the Church of Rome, and of the principles of monarchical government. His next work developed these professions in a more perfect manner. It was entitled, *Apologia pro Regibus*, and professed to be an answer to George Buchanan's work, *De Jure Regni apud Scotos*. Both of these works argue upon extreme and unfair principles. Buchanan seeks to apply to the simple feudal government of Scotland—a monarchical aristocracy—all the maxims of the Roman republicans. Blackwood, on the other hand, is a slavishly devout advocate for the divine right of kings. In replying to one of Buchanan's positions, the apologist of kings says, very gravely, that if one of the scholars at St. Leonard's College were to argue in that manner, he would richly deserve to be whipped. Both of the above works are in Latin. He next published, in French, an account of the death of his benefactress, Queen Mary, under the title, *Martyre de Maria Stuart, Reine d'Écosse*, Antwerp, 8vo, 1588. This work is conceived in a tone of bitter resentment regarding the event to which it refers. He addresses himself, in a vehement strain of passion, to all the princes of Europe to avenge her death; declaring that they are unworthy of royalty if they are not roused on so interesting and pressing an occasion. At the end of the volume is a collection of poems in Latin, French, and Italian, upon Mary and Elizabeth; in which the former princess is praised for every excellence, while her murderess is characterized by every epithet expressive of indignation and hate. An anagram was always a good weapon in those days of conceit and false taste; and one which we find in this collection was no doubt looked upon as a most poignant stab at the Queen of England:—

ELIZABETA TRUDERA
VADE, JEZEBEL TETRA.

In 1598 Blackwood published a manual of devotions under the title, *Sanctarum Precationum Proemia*, which he dedicated to his venerable patron, the Archbishop of Glasgow. The cause of his writing this book was, that by reading much at night he had so weakened his eyes, as to be unable to

distinguish his own children at the distance of two or three yards; in the impossibility of employing himself in study, he was prevailed upon, by the advice of the archbishop, to betake himself to a custom of nocturnal prayer, and hence the composition of this book. In 1606 Blackwood published a Latin poem on the inauguration of James VI. as King of Great Britain. In 1609 appeared at Poitiers a complete collection of his Latin poems. He died in 1623, in the seventy-fourth year of his age, leaving four sons (of whom one attained to his own senatorial dignity in the parliament of Poitiers), and seven daughters. He was most splendidly interred in St. Porcharius' church at Poitiers, where a marble monument was reared to his memory, charged with a long panegyric epitaph. In 1644 appeared his *Opera Omnia*, in one vol. 4to., edited by the learned Naudæus, who prefixes an elaborate eulogium upon the author. Blackwood was not only a man of consummate learning and great genius, but is allowed to have also fulfilled, in life, all the duties of a good man.

BLACKWOOD, HENRY, brother to the subject of the preceding article, and his senior by some years, was educated under nearly similar circumstances, and, in 1551, he taught philosophy in the university of Paris. Having afterwards applied himself to the study of medicine, he rose to be dean of that faculty at Paris, an office of the very highest dignity which could then be reached by a member of the medical profession. He appears to have been one of the earliest modern physicians who gave a sanction to the practice of letting blood. He published various treatises on medicine, and also upon philosophy, of which a list is preserved in Mackenzie's *Lives of Scots Writers*. He acted at one time as physician to the Duke of Longueville, with a salary of 200 pistoles. At another time, when the plague prevailed at Paris, he remained in the city, and exerted himself so zealously in the cure of his numerous patients, as to gain universal applause. He died in 1613 or 1614, at a very advanced age.

BLACKWOOD, WILLIAM, an eminent publisher, and originator of the magazine which bears his name, was born in Edinburgh, November 20, 1776, of parents who, though in humble circumstances, bore a respectable character, and were able to give this and their other children an excellent elementary education. At the age of fourteen he commenced an apprenticeship with Messrs. Bell and Bradfute, booksellers in his native city, with whom he continued six years. During this time he stored his mind with a large fund of miscellaneous reading, which was of great service to him in after-life. It is probable that he at the same time manifested no common talents for business, as, soon after the expiration of his apprenticeship [1797], he was selected by Messrs. J. Mundell and Company, then carrying on an extensive publishing business in the Scottish capital, to take the charge of a branch of their concern which they had resolved to establish in Glasgow. Mr. Blackwood acted as the Glasgow agent of Mundell and Company for a year, during which time he improved greatly as a man of business. Thrown in a great measure upon his own resources, he here acquired habits of decision, such as are rarely formed at so early an age, and which were afterwards of the greatest importance to him. Having also occasion to write frequently to his constituents, he formed a style for commercial correspondence, the excellence of which was a subject of frequent remark at a later period of his life.

At the end of the year, when the business he had conducted at Glasgow was given up, Mr. Blackwood returned to Messrs. Bell and Bradfute, with whom he continued about a year longer. He then (1800) entered into partnership with Mr. Robert Ross, a bookseller of some standing, who also acted as an auctioneer of books. Not long after, finding the line of business pursued by Mr. Ross uncongenial to his taste, he retired from the partnership, and, proceeding to London, placed himself, for improvement in the antiquarian department of his trade, under Mr. Cuthill. Returning once more to Edinburgh in 1804, he set up on his own account in a shop in South Bridge Street, where for several years he confined his attention almost exclusively to the department just alluded to, in which he was allowed to have no rival of superior intelligence in Scotland. The catalogue of old books which he published in 1812, being the first of the kind in which the books were classified, and which referred to a stock of uncommon richness and variety, continues till the present day to be a standard authority for the prices of old books. At this period of his career Mr. Blackwood became agent for several of the first London publishing houses, and also began to publish extensively for himself. In 1816, having resolved to throw a larger share of his energies into the latter department of business, he sold off his stock of old books, and removed to a shop in the new town, soon to become one of the most memorable localities connected with modern literary history.

For a considerable time Mr. Blackwood had been of opinion that something like the same regeneration which the *Edinburgh Review* had given to periodical criticism, might be communicated to that species of miscellaneous literature which chiefly assumed the monthly form of publication. At this time the *Scots Magazine* of his native city, which had never pretended to any merit above that of a correct register, was scarcely in any respect more flat and insipid than the publications of the same kind in London. It was reserved for the original and energetic mind of the subject of this memoir, to raise this department of popular literature from the humble state in which it had hitherto existed, or to which, when we recollect the labours of Johnson and Goldsmith, we may rather say it had sunk, and to place it on the eminence for which it was evidently fitted. The first number of *Blackwood's Magazine* appeared in April, 1817, and, though bearing more resemblance to preceding publications of the same kind than it afterwards assumed, the work was from the first acknowledged by the public to possess superior merit. The publishers of the elder magazines made an almost immediate, though indirect confession to this effect, by attempts to put new and more attractive faces upon their publications, and stimulate the lagging energies of those who conducted them. The two young men who were chiefly engaged upon the work of Mr. Blackwood, having disagreed with him, were employed by Mr. Constable to take the charge of the *Scots Magazine*, which he, like others in similar circumstances, was endeavouring to resuscitate from the slumbers of a century. Mr. Blackwood was already more than independent of these gentlemen, in consequence of the aid which he was receiving from other quarters; but bitter feelings had nevertheless been engendered, and these found vent, through the fancy of some of his new contributors, in the celebrated article in the seventh number of his magazine, styled *Translation of a Chaldee Manuscript*. In this *jeu d'esprit*, the circumstances of the late feud, and the efforts of Mr. Constable to repair the fortunes of his ancient magazine, were thrown

into a form the most burlesque that ever imagination conceived, though certainly with very little of the ill nature which the article unfortunately excited in the most of those who figured in it. In consequence of the painful feelings to which it gave rise, Mr. Blackwood cancelled it from all the copies within his reach; and it is now, consequently, very rarely to be met with.

Blackwood's Magazine, as already hinted, had not been in progress for many months before it obtained the support of new and unexpected talent. Mr. John Wilson, already distinguished by his beautiful poetry, and Mr. John G. Lockhart, whose more regular, though perhaps less brilliant genius afterwards found a fitting field in the management of the *Quarterly Review*, were at this time young men endeavouring to make their way at the Scottish bar. Having formed an attachment to Mr. Blackwood, they threw into his literary repertory the overflowing bounties of two minds, such as rarely rise singly, and much more rarely together; and soon enchaind the attention of the public to a series of articles not more remarkable for their ability, than for an almost unexampled recklessness of humour and severity of sarcasm. It is not to be denied that much offence was thus occasionally given to the feelings of individuals; but, in extenuation of any charge which can be rested on such grounds, it may be pointed out that, while Mr. Blackwood had his own causes of complaint in the ungenerous hostility of several of his commercial brethren, the whimsical genius of his contributors had unquestionably found a general provocation in the overweening pretensions and ungracious deportment of several of their literary seniors, some of whom had, in their own youth, manifested equal causticity, with certainly no greater show of talent. To these excuses must be added the relative one of politics. Mr. Blackwood from the first took a strong part with the existing Tory government, which in Edinburgh had been powerfully supported heretofore in every manner except by the pen, while the opposition had long possessed a literary organ of the highest authority. In treating, therefore, of some of the juvenile indiscretions of this extraordinary work, and those connected with it, we must, if willing to preserve impartiality, recollect the keenness with which politics and political men were then discussed.

In the management of the magazine, Mr. Blackwood at all times bore in his own person the principal share. The selection of articles, the correspondence with contributors, and other duties connected with editorship, were performed by him during a period of seventeen years, with a degree of skill on which it is not too much to say that no small portion of the success of the work depended. In its earlier years he contributed two or three articles himself; but to this, as a *practice*, he had a decided objection, as he could easily perceive that an editor, especially one like himself not trained to letters, is apt to be biased respecting his own compositions. It may easily be conceived, however, that, in the management of the literary and mercantile concerns of such a work, there was sufficient employment for even a man of his extraordinary energies. And no small praise must it ever be to the subject of this brief memoir, that, during so long a period, he maintained in his work so much of the vivid spirit with which it set out; kept up so unflinching a succession of brilliant articles in general literature, altogether exclusive of the regular papers of Mr. Wilson,—as if he were exhausting mind after mind among the literary men of his country, and still at no loss to discover new; and never throughout his

whole career, varied in a single page from the political key-note which he had struck at the commencement. To have done these things, and with so much apparent ease to himself, and so little ostentation—for these were features in his masterly career—argues, in our opinion, a character of unwonted vigour, as well as no small share of intellectual power.

The magazine eventually reached a circulation not much short of ten thousand copies, and, while reprinted in North America, found its way from the publisher's warehouse into every other part of the world where the English language was spoken. Notwithstanding the great claims it made upon his time, Mr. Blackwood continued till his death to transact a large share of business as a general publisher. Not long before that event, he completed the *Edinburgh Encyclopedia*, in eighteen volumes quarto, and among his other more important publications, may be reckoned *Kerr's Collection of Voyages and Travels*, in eighteen volumes octavo. The chief distinct works of Messrs. Wilson, Lockhart, Hogg, Moir, Galt, and other eminent persons connected with his magazine, and some of the writings of Sir Walter Scott, were published by Mr. Blackwood. He also continued till the close of his career to carry on an extensive trade in retail bookselling.

Mr. Blackwood died, September 16, 1834, after a painful illness of four months. His disease, a tumour in the groin, had in that time exhausted his physical energies, but left his temper calm and unruffled, and his intellect entire and vigorous even to the last.

In the words of his obituarist, "No man ever conducted business in a more direct and manly manner than Mr. Blackwood. His opinion was on all occasions distinctly expressed; his questions were ever explicit; his answers conclusive. His sincerity might sometimes be considered as rough, but no human being ever accused him either of flattering or of shuffling; and those men of letters who were in frequent communication with him, soon conceived a respect and confidence for him, which, save in a very few instances, ripened into cordial regard and friendship. The masculine steadiness and imperishable resolution of his character were impressed on all his proceedings; and it will be allowed by those who watched him through his career, as the publisher of a literary and political miscellany, that these qualities were more than once very severely tested. He dealt by parties exactly as he did by individuals. Whether his principles were right or wrong, they were *his*, and he never compromised or complimented away one tittle of them. No changes, either of men or of measures, ever dimmed his eye or checked his courage."

Mr. Blackwood was twice a magistrate of his native city, and in that capacity distinguished himself by an intrepid zeal in the reform of burgh management, singularly in contrast with his avowed sentiments respecting constitutional reform.

BLAIR, HUGH, D.D., one of the most eminent divines and cultivators of polite literature of the eighteenth century, was born at Edinburgh, April 7, 1718. His father, John Blair, a merchant of Edinburgh, and who at one time occupied a respectable office in the magistracy, was grandson to Robert Blair, an eminent divine of the seventeenth century, whose life is commemorated in its proper place in this work. John Blair was thus cousin-german to the author of *The Grave*, whose life follows, in the present work, that of his distinguished ances-

tor. John Blair, having impaired his fortune by engaging in the South Sea scheme, latterly held an office in the excise. He married Martha Ogston, and the first child of this marriage was the subject of the following memoir.

Hugh Blair was early remarked by his father to possess the seeds of genius. For this reason, joined to a consideration, perhaps, of his delicate constitution, he was educated for the church. He commenced his academic career at the university of Edinburgh, October, 1730, and as his weakly health disabled him from enjoying the usual sports of boyhood, his application to study was very close. Among the numerous testimonies to his proficiency which were paid by his instructors, one deserves to be particularly mentioned, as, in his own opinion, it determined the bent of his genius towards polite literature. An essay, *Περὶ τῶν καλῶν*, that is, upon the BEAUTIFUL,¹ written by him when a student of logic in the usual course of academical exercises, had the good fortune to attract the notice of Professor Stevenson, and, with circumstances honourable to the author, was appointed to be read in public at the conclusion of the session. This mark of distinction, which occurred in his sixteenth year, made a deep impression on his mind; and the essay which merited it he ever after recollected with partial affection, and preserved to the day of his death, as the first earnest of his fame.

At this time Dr. Blair commenced a method of study which contributed much to the accuracy and extent of his knowledge, and which he continued to practise occasionally even after his reputation was fully established. It consisted in making abstracts of the most important works which he read, and in digesting them according to the train of his own thoughts. History, in particular, he resolved to study in this manner; and in concert with some of his youthful associates, he constructed a very comprehensive scheme of chronological tables, for receiving into its proper place every important fact which should occur. The scheme devised by this young student for his own private use was afterwards improved, filled up, and given to the public, by his learned relative Dr. John Blair, prebendary of Westminster, in his valuable work *The Chronology and History of the World*.

In 1739, on taking the degree of Master of Arts, Blair printed his thesis, *De Fundamentis et Obligatione Legis Nature*, which contains a brief outline of these moral principles afterwards developed in his sermons, and displays the first dawnings of that virtuous sensibility by which he was at all periods of his public life so highly distinguished. On the 21st of October, 1741, he was licensed as a preacher by the presbytery of Edinburgh, and soon began, in the usual manner, to exhibit himself occasionally in the pulpit. Heretofore the only popular style of preaching in Scotland was that of the evangelical party, which consisted chiefly in an impassioned address to the devotional feelings of the audience. The moderate party, who were of course least popular, had neither lost the practice of indulging in tedious theological disquisitions, nor acquired that of expatiating on the moral duties. The sermons of this young licentiate, which presented sound practical doctrines in a style of language almost unknown in Scotland, struck the minds of the audience as something quite new. In the course of a very few months his fame had travelled far beyond the bounds of his

¹ A technical Greek phrase, expressing the abstract idea of the perfection of beauty in objects of taste. A devotion to the "To kalon" in that nation, was similar to what the moderns understand by a correct taste.

native city. A sermon which he preached in the West Church produced an extraordinary impression, and was spoken of in highly favourable terms to the Earl of Leven. His lordship accordingly presented the preacher to the parish church of Colesie in Fife, which happened to be then vacant. He was ordained to this charge, September 23, 1742, but was not long permitted to labour in so confined a scene. In a few months he was brought forward by his friends as candidate for the second charge of the church of Canongate, which may almost be considered a metropolitan situation. In the popular election which followed, he was successful against a very formidable competitor, Mr. Robert Walker, then a favourite preacher. He was inducted to this charge, July 14, 1743, when he had little more than completed his twenty-fifth year. On the occasion of the insurrection of 1745, Blair preached a sermon in the warmest strain of loyalty to the existing government, and which he afterwards printed. During the eleven years which he spent in the Canongate, his sermons attracted large audiences from the adjoining city, and were alike admired for their eloquence and piety. They were composed with uncommon care; and, occupying a middle place between the dry metaphysical discussion of one class of preachers, and the loose incoherent declamation of the other, they blended together in the happiest manner the light of argument with the warmth of exhortation, and exhibited captivating specimens of what had hitherto been rarely heard in Scotland,—the polished, well-compacted, and regular didactic oration.

On the 11th of October, 1754, he was called by the town-council of Edinburgh to one of the city charges, that of Lady Yester's church, and on the 15th of June, 1758, he was promoted by the same body to the highest situation attainable by a Scottish clergyman—one of the charges of the High Church. This latter removal took place, according to the records of the town-council, "because they had it fully ascertained that his translation would be highly acceptable to persons of the most distinguished character and eminent rank in this country who had seats in said church." In truth, this place of worship might have been styled, in the absence of an episcopal system, the *metropolitan* church of Scotland. In it sat the Lords of Session and all the other great law and state officers, besides the magistrates and council, and a large congregation of the most respectable inhabitants of the town. It might now therefore be said that the eloquence of Blair had at last reached a fit theatre for its display. In the year previous to this last translation he had been honoured by the university of St. Andrews with the degree of D.D., which was then very rare in Scotland.

Hitherto Blair's attention seems to have been chiefly devoted to his profession. No production of his pen had yet been given to the world by himself, except two sermons preached on particular occasions, some translations of passages of Scripture for the psalmody of the church, and the article on Hutcheson's system of moral philosophy for the *Edinburgh Reviewer*—a periodical work begun in 1755 by Hume, Robertson, and others, and which only extended to two numbers. Standing, as he now did, at the head of his profession, and released, by the labour of former years, from the drudgery of weekly preparation for the pulpit, he began to think seriously on a plan for teaching to others the art which had contributed so much to his own fame. Some years before, Dr. Adam Smith had delivered in Edinburgh a series of lectures on rhetoric and elegant literature, which had been well received. In 1759 Dr. Blair commenced, with the approbation of the university, a course upon

the principles of literary composition. The most zealous friends to this undertaking were David Hume and Lord Kames, the latter of whom had devoted much attention to the subject. The approbation bestowed upon the lectures was so very high, and their fame became so generally diffused, that the town-council resolved to institute a rhetorical class in the university, under his direction; and, in 1762, this professorship was taken under the protection of the crown, with a salary of £70 pounds a year. Dr. Blair continued to deliver his lectures annually till 1783, when he published them for the more extensive benefit of mankind. They are not by any means, nor were they ever pretended to be, a profound or original exposition of the laws of the *belles lettres*. They are acknowledged to be a compilation from many different sources, and only designed to form a simple and intelligible code for the instruction of youth in this department of knowledge. Regarded in this light, they are entitled to very high praise, which has accordingly been liberally bestowed by the public. These lectures have been repeatedly printed, and still remain an indispensable monitor in the study of every British scholar.

In 1763 Dr. Blair made his first appearance before the world as an author or critic. He had, in common with his friend John Home, taken a deep interest in the exertions of Macpherson for the recovery of the Highland traditional poetry. Relying without suspicion upon the faith of the collector, he prefixed to the *Poems of Ossian* a dissertation pointing out the beauties of those compositions. The labour must of course be now pronounced in a great measure useless; but nevertheless, it remains a conspicuous monument of the taste of Dr. Blair.

It was not till 1777 that he could be prevailed upon to offer to the world any of those sermons with which he had so long delighted a private congregation. We have his own authority for saying that it was his friend Lord Kames who was chiefly instrumental in prompting him to take this step. For a long period hardly any sermons published either in England or Scotland had met with success. The public taste seemed to have contracted an aversion to this species of composition. We are informed by Boswell in his *Life of Johnson*, that, when Blair transmitted a volume to Mr. Strahan, the king's printer, that gentleman, after letting it lie beside him for some time, returned a letter discouraging the publication. It is probable that this opinion, which seems to have been given only on general grounds, might have caused Dr. Blair to abandon his intention; but fortunately, Mr. Strahan had sent one of the sermons to Dr. Johnson for his opinion, and after his unfavourable letter to Dr. Blair had been sent off, he received from Johnson on Christmas eve, 1776, a note, of which the following is a paragraph: "I have read over Dr. Blair's first sermon with more than approbation; to say it is good is to say too little." Mr. Strahan had very soon after this time a conversation with Dr. Johnson concerning the sermons; and then he very candidly wrote again to Dr. Blair, inclosing Johnson's note, and agreeing to purchase the volume, with Mr. Cadell, for £100. The sale was so rapid and extensive, and the approbation of the public so high, that, to their honour be it recorded, the proprietors made Dr. Blair a present, first of one sum, and afterwards of another of £50, thus voluntarily doubling the stipulated price. Perhaps in no country, not even in his own, were these compositions so highly appreciated as in England. There they were received with the keenest relish, not only on account of their abstract excellence, but partly from a kind of surprise as to the quarter from which they

came—no devotional work produced by Scotland having ever before been found entitled to much attention in the southern section of the island. The volume speedily fell under the attention of George III. and his virtuous consort, and was by them very highly admired. His majesty, with that wise and sincere attention to the interests of religion and virtue which constituted the best part of his reign, was graciously pleased to judge the author worthy of a public reward. By a royal mandate to the exchequer in Scotland, dated July 25, 1780, a pension of £200 a year was bestowed on Dr. Blair. It is said that the sermons were first read in the royal closet by the Earl of Mansfield; and there is little reason to doubt that they were indebted in some degree to the elocution of the "elegant Murray" for the impression which they produced upon the royal family.

During the subsequent part of his life Dr. Blair published three other volumes of sermons; and it might safely be said that each successive publication only tended to deepen the impression produced by the first. These compositions, which were translated into almost every language in Europe, formed only a small part of the discourses which he prepared for the pulpit. The number of those which remained was creditable to his professional character, and exhibited a convincing proof that his fame as a public teacher had been honourably purchased by the most unwearied application to the private and unseen labours of his office. Out of his remaining manuscripts he had prepared a fifth volume, which appeared after his death; the rest, according to an explicit injunction in his will, were committed to the flames. The last sermon which he composed was one in the fifth volume, "on a life of dissipation and pleasure." Though written at the age of eighty-two, it is a dignified and eloquent discourse, and may be regarded as his solemn parting admonition to a class of men whose conduct is highly important to the community, and whose reformation and virtue he had long laboured most zealously to promote.

THE SERMONS OF BLAIR are not now, perhaps, to be criticized with that blind admiration which ranked them, in their own time, amidst the classics of English literature. The present age is now generally sensible that they are deficient in that religious unction which constitutes the better part of such compositions, and are but little calculated to stir and rouse the heart to a sense of spiritual duty. Everything, however, must be considered more or less relatively. Blair's mind was formed at a time when the fervours of evangelical divinity were left by the informed classes generally to the lowly and un instructed hearts, which, after all, are the great citadels of religion in every country. A certain order of the clergy, towards the end of the eighteenth century, seemed to find it necessary, in order to prevent an absolute revolt of the higher orders from the standards of religion, to accommodate themselves to the prevailing taste, and only administer moral discourses, with an insinuated modicum of real piety, where their proper purpose unquestionably is to maintain spiritual grace in the breasts of the people by all the means which the gospel has placed within their reach. Thus, as Blair preached to the most refined congregation in Scotland, he could hardly have failed to fall into this prevalent fashion; and he perhaps considered, with perfect sincerity, that he was justified by the precept of St. Paul, which commands the ministers of religion to be "all things to all men." Religious feeling is modified by time and place; and I do not apprehend it to be impossible that the mind of Hugh Blair, existing at the time of his celebrated

ancestor, might have exerted itself in maintaining the covenant, and inspiring the populace with the energy necessary for that purpose; while the intellect and heart of his predecessor, if interchanged, might have spent their zeal in behalf of Henry Viscount Melville, and in gently pleasing the minds of a set of modern indifferents with one grain of the gospel dissolved into a large cooling-draught of moral disquisition.

The remaining part of the life of Blair hardly affords a single additional incident. He had been married in 1748 to his cousin, Katherine Bannatyne, daughter of the Rev. James Bannatyne, one of the ministers of Edinburgh. By this lady he had a son who died in infancy, and a daughter, who survived to her twenty-first year—the pride of her parents, and adorned with all the accomplishments which belong to her age and sex. Mrs. Blair—herself a woman of great good sense and spirit—was also taken from him a few years before his death, after she had shared with the tenderest affection in all his fortunes, and contributed nearly half a century to his happiness and comfort. The latter part of his life was spent in the enjoyment of a degree of public respect which falls to the lot of few men, but which was eminently deserved by him, both on account of his high literary accomplishments, and the singular purity and benevolence of his private character. He latterly was enabled, by the various sources of income which he enjoyed, to set up a carriage—a luxury enjoyed, perhaps, by no predecessor in the Scottish church, and by very few of his successors. He also maintained an elegant hospitality, both at his town and country residences, which were much resorted to by strangers of distinction who happened to visit Edinburgh.

It may be curious to know in what manner those discourses were delivered from the pulpit, which have so highly charmed the world in print. As might be easily supposed, where there was so much merit of one kind, there could scarcely, without a miracle, be any high degree of another and entirely different kind. In truth, the elocution of Dr. Blair, though accompanied by a dignified and impressive manner, was not fit to be compared with his powers of composition. His voice was deformed by a peculiarity which I know not how to express by any other term than one almost too homely for modern composition—a *bar*. He also wanted all that charm which is to be derived from gesticulation, and, upon the whole, might be characterized as a somewhat formal preacher.

In what is called church politics Dr. Blair was a strenuous moderate, but never took an active share in the proceedings of the church. A constitutional delicacy of organization unfitted him for any scene where men have to come into strong and personal collision. In temporal politics he was a devout admirer of the existing constitution, and a zealous supporter of the Tory government which flourished during the greater part of the reign of George III. With Viscount Melville, to whose father he had dedicated his thesis in early youth, he maintained a constant interchange of civilities. At the breaking out of the French revolution he exerted himself in the most energetic manner to stop the tide of disaffection and irreligion which at one particular crisis seemed to threaten all existing institutions. He declared in the pulpit that none but a good subject could be a good Christian; an expression so strongly akin to the ancient doctrines of passive obedience and non-resistance, that it can only be excused by the particular circumstances of the time. The mind of Blair was too fastidiously exact and elegant to

display anything of the majestic. Possessing more taste than genius, he never astonished in conversation by any original remark. In company he made a far less striking appearance than the half-instructed peasant Burns, who, at his first visit to Edinburgh, was warmly patronized by Dr. Blair. In some points of view, his mind bore an unprepossessing aspect. He was content to read, and weak enough to admire, the wretched fictitious compositions which appeared in that age under the denomination of novels. He would talk profusely of the furniture of the room in which he was sitting, criticizing every object with a sincere and well-weighed attention, which would not have been ill-bestowed upon the most solemn subjects. In his dress, and in almost all points of mere *externe* and ceremonial form, he was minutely fastidious. He was also so fond of the approbation of his fellow-creatures—in moderation a most useful feature of character—that even very marked flattery was received by him not only without displeasure, but with an obviously keen relish, that said little either for his discrimination or his modesty. Yet, with these less worthy points of character, Blair had no mean moral feelings. He was incapable of envy, spoke liberally and candidly of men whose pursuits and opinions differed from his own, and was seldom betrayed into a severe remark upon any subject unconnected with actual vice.

Though his bodily constitution was by no means robust, yet by habitual temperance and by attention to health, his life was happily prolonged beyond the usual period. For some years he had felt himself unequal to the fatigue of instructing his very large congregation from the pulpit; and under the impression which this feeling produced, he has been heard to say with a sigh, that "he was left almost the last of his contemporaries." Such, nevertheless, was the vigour of his mind, that in 1799, when past the eightieth year of his age, he composed and preached one of the most effective sermons he ever delivered, on behalf of the fund for the benefit of the sons of the clergy. He was also employed during the summer of 1800 in preparing his last volume for the press; and for this purpose he copied the whole with his own hand. He began the winter, pleased with himself on account of this exertion; and his friends were flattered with the hope that he might live to enjoy the accession of emolument and fame which he expected it would bring. But the seeds of a mortal disease were lurking within him. On the 24th of December he felt slight pain in his bowels, with which neither he nor his friends were alarmed. On the afternoon of the 26th, this pain increased, and violent symptoms began to appear, the causes of which were then unfortunately unknown both to himself and his physician. He had for a few years laboured under an inguinal hernia. This malady, which he was imprudently disposed to conceal, he considered as trifling; and he understood that, by taking the ordinary precautions, nothing was to be apprehended from it. It settled, however, into a stoppage of the bowels, and ere the physician was made aware of his condition, an inflammation had taken place, and he consequently survived only till the morning of the 27th, thus expiring almost at the same time with that century of the Christian epoch of which he had been one of the most distinguished ornaments. He died in the eighty-third year of his age, and the fifty-ninth of his profession as a minister of the gospel.

BLAIR, JAMES, an eminent divine, was reared for the Episcopal church of Scotland, at the time when it was struggling with the popular dislike in the reign

of Charles II. Discouraged by the equivocal situation of that establishment in Scotland, he voluntarily abandoned his preferments and removed to England, where he was patronized by Compton, Bishop of London. By this prelate he was prevailed upon to go as a missionary to Virginia, in 1685, and, having given the greatest satisfaction by his zeal in the propagation of religion, he was, in 1689, preferred to the office of commissary to the bishop, which was the highest ecclesiastical dignity in that province. His exertions were by no means confined to his ordinary duties. Observing the disadvantage under which the province laboured through the want of seminaries for the education of a native clergy, he set about, and finally was able to accomplish, the honourable work of founding the college of Williamsburgh, which was afterwards, by his personal intervention, endowed by King William III., with a patent, under the title of the William and Mary College. He died in 1743, after having been president of this institution for about fifty, and a minister of the gospel for above sixty, years. He had also enjoyed the office of president of the council of Virginia. In the year before his death he had published at London his great work, entitled *Our Saviour's Divine Sermon on the Mount explained, and the Practice of it Recommended, in divers Sermons and Discourses*, 4 vols. 8vo., which is styled by Dr. Waterland, the editor of a second edition, "a valuable treasure of sound divinity and practical Christianity."

BLAIR, JOHN, a churchman of noble family, who, being compelled by the tyranny of Edward I. in Scotland to join the bands of Sir William Wallace, became chaplain to that hero, and did not scruple also to take a share in his battles. He wrote an account of the deeds of Wallace, which is now lost, but is supposed to have furnished materials to Blind Harry. Another work of Blair's was styled, *De Liberata Tyrannide Scotia*.

BLAIR, JOHN, LL.D., an eminent chronologist, was, as already mentioned in the memoir of Dr. Hugh Blair, a relative of that distinguished personage. He received a clerical education at Edinburgh, and afterwards went in search of employment to London, along with Mr. Andrew Henderson, author of a *History of the Rebellion of 1745*, and many other works, and who, for some years, kept a bookseller's shop in Westminster Hall. As Henderson describes himself as residing in Edinburgh at the time of the battle of Prestonpans, it is probable that Blair's removal to London took place after that event. Henderson's first employment was that of an usher at a school in Hedge Lane, in which he was succeeded by Blair. The attention of the latter had probably been directed to chronology by the example of Dr. Hugh Blair, who, as already mentioned, commenced a series of tables of events for his own private use, which ultimately formed the foundation of the work given to the world, in 1754, under the title of *The Chronology and History of the World, from the Creation to the year of Christ, 1753*; "illustrated in fifty-six tables, of which four are introductory, and contain the centuries prior to the first Olympiad, and each of the remaining fifty-two contain, in one expanded view, fifty years, or half a century. By the Rev. John Blair, LL.D." This large and valuable work was published by subscription, and was dedicated to Lord-chancellor Hardwicke. In January, 1755, Dr. John Blair was elected F.R.S., and in 1761, F.A.S. In 1756 he published a new edition of his *Chronology*. In September, 1757, he was appointed chaplain to the

Dowager Princess of Wales, and mathematical tutor to the Duke of York (brother to George III.); and on Dr. Townshend's promotion to the deanery of Norwich, the services of Dr. Blair were rewarded, March, 1761, with a prebendal stall in Westminster Abbey. Such a series of rapidly accumulating honours has fallen to the lot of very few Scottish adventurers. But this was not destined to be the end of his good fortune. He had only been prebend of Westminster six days, when the death of the vicar of Hinckley, in Leicestershire, enabled the dean and chapter to present him to that valuable living, to which was soon after added, the rectory of Burton-coggles in Lincolnshire. In 1763-4 he made the tour of the Continent, in company with his royal pupil. A new and enlarged edition of his *Chronology* appeared in 1768, and in 1771 he was presented, by the Dean and Chapter of Westminster, to the vicarage of St. Bride's in the city of London, which made it necessary for him to resign Hinckley. In 1776 he resigned St. Bride's, in order to succeed to the rectory of St. John the Evangelist in Westminster; and in June that year he obtained a dispensation to hold this benefice along with that of Horton, near Colebrook, in Buckinghamshire. In the memorable sea-fight of the 12th of August, 1782, his brother, Captain Blair, in the command of the *Anson*, was one of three distinguished officers who fell, and to whom the country afterwards voted a monument. This event gave such a shock to the venerable doctor, who at that time suffered under influenza, that he died at his house in Dean's Yard, Westminster, on the 24th of June following. A work entitled, *Lectures on the Canons of the Old Testament*, appeared after his death; but his best monument unquestionably will be his *Chronology*, the value of which has been so amply acknowledged by the world.

BLAIR, PATRICK, M.D., an eminent botanist in the earlier period of the existence of that science in Britain, was first known as a practitioner of surgery and physic at Dundee, where he brought himself into prominent notice as an anatomist, 1706, by the dissection of an elephant which died near that place. He was a non-juror or Scottish Episcopalian, and so far attached to the exiled family of Stuart, as to be imprisoned during the insurrection of 1715 as a suspected person. He afterwards removed to London, where he recommended himself to the attention of the Royal Society by some discourses on the sexes of flowers. His stay in London was short, and after leaving it he settled at Boston in Lincolnshire, where Dr. Pulteney conjectures that he practised physic during the remainder of his life. The same writer, in his *Historical and Biographical Sketches of English Botany*, supposes that his death happened soon after the publication of the seventh *Decad* of his *Pharmacobotanologia*, in 1728.

Dr. Blair's first publication was entitled, *Miscellaneous Observations in Physic, Anatomy, Surgery, and Botany*, 8vo, 1718. In the botanical part of this work he insinuates some doubts relating to the method suggested by Petion and others, of deducting the qualities of vegetables from the agreement in natural characters; and instances the *Cynoglossum*, as tending to prove the fallacy of this rule. He relates several instances of the poisonous effects of plants, and thinks the *Echium maritimum* (*Pulmonaria maritima* of Linnæus) should be ranked in the genus *Cynoglossum*, since it possesses a narcotic power. He describes and figures several of the more rare British plants, which he had discovered in a tour made into Wales; for instance, the *Rumex digynus*, *Lobelia dortmanna*, *Alisma ranunculoides*, *Pyrola*

rotundifolia, *Alchemilla alpina*, &c. But the work by which he rendered the greatest service to botany originated with his *Discourse on the Sexes of Plants*, read before the Royal Society, and afterwards greatly amplified and published, at the request of several members of that body, under the title of *Botanical Essays*, 8vo, 1720. This treatise is divided into two parts, containing five essays; the three first respecting what is proper to plants, and the two last what is proper to plants and animals. This is acknowledged by an eminent judge to have been the first complete work, at least in the English language, on that important department of botanical science, the sexes of the plants. The author shows himself well acquainted, in general, with all the opinions and arguments which had been already circulated on the same subject. The value of the work must not be estimated by the measure of modern knowledge, though even at this day it may be read by those not critically versed in the subject, with instruction and improvement. A view of the several methods then invented cannot be seen so connectedly in any other English author. Dr. Blair strengthened the arguments in proof of the sexes of plants by sound reasoning and some new experiments. His reasons against Morland's opinion of the entrance of the *farina* into the vasculum seminale, and his refutation of the Lewenhœkian theory, have met with the sanction of the greatest names in modern botany. Dr. Blair's last distinct publication, which he did not live to complete, was *Pharmacobotanologia*; or, *An Alphabetical and Classical Dissertation on all the British Indigenous and Garden Plants of the New Dispensatory*, 4to, 1723-28. In this work, which was carried no further than the letter H, the genera and species are described, the sensible qualities and medicinal powers are subjoined, with the pharmaceutical uses, and the author also notices several of the more rare English plants discovered by himself in the environs of Boston. Dr. Blair's fugitive writings consist of various papers in the *Philosophical Transactions*, of which one of the most remarkable is an account of the anatomy and osteology of the elephant, drawn up from his observations in dissecting the animal above alluded to at Dundee.

BLAIR, ROBERT, an eminent divine of the seventeenth century, was the sixth and youngest son of John Blair of Windyedge in Ayrshire, and Beatrix Muir, a lady of the honourable house of Rowallan. He was born at Irvine in 1593, and received his education at the college of Glasgow. After acting for some time as assistant to a teacher in that city, he was appointed, in the twenty-second year of his age, to be a regent or professor in the college. In 1616 he was licensed as a minister of the gospel. Happening soon after to preach before the celebrated Robert Bruce, and being anxious to have the judgment of so great and good a man upon his discourse, he took the liberty of directly asking him how he liked the sermon: Bruce said, "I found your sermon very polished and well digested; but there is one thing I did miss in it—to wit, the Spirit of God; I found not that." This criticism made a deep and useful impression upon the young preacher. The prospects of Mr. Blair at Glasgow were clouded, in 1622, by the accession of Cameron to the office of principal in the college. This divine, having been imbrued in France with the tenets of Arminius, became a zealous promoter of the views of the court, for the introduction of Episcopacy into Scotland. Blair speedily became obnoxious to his evil offices, and found it necessary to resign his charge. For some years he officiated to a Presbyterian congre-

gation at Bangour in Ireland, but in 1632 was suspended, along with the equally famous preacher Livingstone, by the Bishop of Down. He then went over to court, to implore the interference of the king (Charles I.), who at length gave a favourable answer to his petition, writing with his own hand upon the margin, "Indulge these men, for they are Scotsmen;" an expression certainly honourable to the heart of the unfortunate monarch. Blair was one of those divines who were reputed in Scotland to have direct communications with heaven, and a power of prophetic vision. While waiting anxiously for the return of his petition, he asked, and, as it is recorded by his biographer, received, a sign from heaven, assuring him that his wishes would be realized. He also "had, from Ezek. xxiv. 16, a strange discovery of his wife's death, and the very bed whereon she was lying, and the particular acquaintances attending her; and although she was in good health at his return home, yet in a little all this came to pass."¹ He had not been long re-established at Bangour, when the bishop found further fault with him, and again sentenced him to be expelled. He now joined in a scheme set on foot by various Presbyterian clergymen in similar circumstances for fitting out a ship, and emigrating to New England. But being driven back by a storm, they conceived that the Almighty will was opposed to their resolution, and accordingly abandoned the scheme. Blair returned to Scotland to mingle in the tumultuous scenes of the covenant. He preached for some time at Ayr, and was afterwards settled by the General Assembly at St. Andrews. In 1640 he accompanied the Scottish army into England, and assisted at the negotiations for the peace of Ripon. After the first burst of the Irish rebellion of 1641, when the Presbyterians of Ireland supplicated the General Assembly for a supply of ministers, Blair was one of those who went over. He soon returned, however, to his charge at St. Andrews. In autumn, 1645, when the Scottish estates and General Assembly were obliged by the prevalence of the plague at Edinburgh to sit in St. Andrews, Blair took a conspicuous part in the prosecution of Sir Robert Spottiswoode and other adherents of Montrose, who had been taken prisoners at Philiphaugh. Sir Robert was sentenced to be beheaded as a traitor. Blair was anxious that an exertion should be made to turn Sir Robert from the errors of his faith, so that he might at least die in the profession of the true religion. He therefore attended him in jail, and even at the scaffold, trying all his eloquence to work a conversion. Spottiswoode appears to have looked upon these efforts in a different spirit from that in which they were made, and was provoked, upon the very scaffold, to reject the prayers of his pious monitor in language far from courteous. Mr. Blair was equally unsuccessful with Captain Guthrie, son of the ex-bishop of Moray, who was soon after executed at the same place.

Blair was one of the Scottish divines appointed in 1645 to reason the king out of his Episcopal possessions at Newcastle. The celebrated Cant, one of his coadjutors in this task, having one day accused his Majesty of favouring Popery, Mr. Blair interrupted him, and hinted that this was not a proper time or place for making such a charge. The unfortunate monarch, who certainly had a claim to this amount upon the gratitude of Blair, appears to have felt the kindness of the remark. At the death of Henderson his Majesty appointed Blair to be his successor as chaplain for Scotland.

In this capacity he had much intercourse with the king, who one day asked him if it was warrantable in prayer to determine a controversy. Blair, taking the hint, said, that in the prayer just finished he did not think that he had determined any controversy. "Yes," said the king, "you determined the Pope to be Antichrist, which is a controversy among divines." Blair said he was sorry that this should be disputed by his Majesty, for certainly it was not so by his father. This remark showed great acuteness in the royal chaplain, for Charles, being a constant defender of the opinions of his father, whose authority he esteemed above that of all professional theologians, was totally unable to make any reply. The constancy of the king in his adherence to the church of Laud rendered, as is well known, all the advices of the Scottish divines unavailing. After spending some months with his Majesty in his captivity at Newcastle, Mr. Blair returned to Scotland.

In 1648, when Cromwell came to Edinburgh for the first time, the commission of the church sent three divines, including Mr. Blair, to treat with him for a uniformity of religion in England. The sectarian general, who looked upon the Scottish Presbyterianism as no better than English Episcopacy, but yet was anxious to conciliate the northern divines, entertained this legation with smooth speeches, and made many solemn appeals to God, as to the sincerity of his intentions. Blair, however, had perceived the real character of Cromwell, and thought it necessary to ask explicit answers to the three following categories:—1. What was his opinion of monarchical government? To this he answered, that he was for monarchical government; which exactly suited the views of the Scottish Presbyterians. 2. What was his opinion ament toleration? He answered confidently, that he was altogether against toleration; which pleased, if possible, still better. 3. What was his opinion concerning the government of the church? "Oh, now," said Cromwell, "Mr. Blair, you article me too severely; you must pardon me that I give you not a present answer to this." When the deputation left him Mr. David Dickson said to Mr. Blair, "I am glad to hear this man speak no worse;" to which the latter replied, "If you knew him as well as I, you would not believe a word he says, for he is an egregious dissembler."

Blair continued to be a zealous and useful minister during the usurpation of Cromwell, but after the restoration fell speedily under the censure of his metropolitan, Archbishop Sharpe. For some years he had no regular place of worship, but preached and ministered when he met with a favourable opportunity. During his later years, being prohibited from coming within twenty miles of St. Andrews, he lived at Meikle Couston, in the parish of Aberdour, where he died, August 27, 1666, in the 73d year of his age. He was buried in the churchyard of Aberdour, where there is a small tablet to his memory.

Robert Blair was the author of a *Commentary on the Book of Proverbs*, and also of some political pieces, none of which have come down to modern times. His abilities were singularly revived in more than one branch of his numerous progeny, particularly in his grandson, the author of *The Grave*, and his two great-grandsons, Dr. Hugh Blair, and Robert Blair, president of the Court of Session.

BLAIR, ROBERT, author of *The Grave*, a Poem, was the eldest son of the Rev. David Blair, one of the ministers of Edinburgh, and chaplain to the king, who, in his turn, was son to the subject of the preceding article. The mother of the author of

¹ *Scots Worthies*, new edition, 1827, p. 302.

The Grave was a Miss Nisbet, daughter of Mr. Nisbet of Carfin. He was born in the year 1699, and after the usual preparatory studies, was ordained, in 1731, minister of Athelstaneford, in East Lothian, where he spent the remainder of his life. Possessing a small fortune in addition to his stipend as a parish clergyman, he lived, we are told, rather in the style of a country gentleman than of a minister, keeping company with the neighbouring gentry, among whom Sir Francis Kinloch of Gilmerton, patron of the parish, was one of his warmest friends. Blair, we are further informed, was at once a man of learning and of elegant taste and manners. He was a botanist and florist, which he showed in the cultivation of his garden; and was also conversant in optical and microscopical knowledge, on which subjects he carried on a correspondence with some learned men in England. He was a man of sincere piety, and very assiduous in discharging the duties of his clerical functions. As a preacher, he was serious and warm, and discovered the imagination of a poet. He married Miss Isabella Law, daughter of Mr. Law of Elvingston, who had been professor of moral philosophy in the university of Edinburgh; by this lady, who survived him, he had five sons and one daughter. His fourth son, who bore his own name, arose, through various gradations of honour at the Scottish bar, to be president of the Court of Session.

Blair had turned his thoughts, at an early period of life, to poetry. While still very young, he wrote some verses to the memory of his future father-in-law, Mr. Law, who was also his blood-relation. We have his own testimony for saying, that his *Grave* was chiefly composed in that period of his life which preceded his ordination as a parochial clergyman. An original manuscript of the poem, in the possession of his son the lord-president, was dated 1741-2; and it appears, from a letter written by the author to Dr. Doddridge, in February that year, that he had just been endeavouring, through the influence of his correspondent, Dr. Isaac Watts, to induce the London booksellers to publish it. It was rejected by two of these patrons of literature, to whom it had been recommended by Dr. Watts; but was finally printed at London, in 1743, "for Mr. Cooper." The author appears to have been seriously anxious that it should become a popular work, for he thus writes to Dr. Doddridge:—"In order to make it more generally liked, I was obliged sometimes to go cross to my own inclination, well knowing that, whatever poem is written upon a serious argument must, upon that very account, be under serious disadvantages; and therefore proper arts must be used to make such a piece go down with a licentious age, which cares for none of those things." This is not very clearly intelligible, but, perhaps, alludes to the plain, strong, rational, and often colloquially familiar language of the poem, which the plurality of modern critics will allow to be its best feature. *The Grave* is now to be esteemed as one of the standard classics of English poetical literature, in which rank it will probably remain longer than many works of greater contemporary, or even present, fame.

BLANE, SIR GILBERT, M.D., of Blane-field, Ayrshire, and Culterlands, Berksire, Bart. This eminent physician was the fourth son of Gilbert Blane of Blane-field, in the county of Ayr, and was born at that place A.D. 1749. Being destined by his parents for the church, he was sent at an early age to the university of Edinburgh; but in consequence of certain religious scruples, he abandoned the purpose of studying for the ministry, and turned his thoughts to the medical profession, for which he soon

found that he had a peculiar vocation. His remarkable diligence and proficiency in the different departments of medical science secured the notice not only of his class-fellows, but the professors, so that on graduating as a physician, he was recommended by Dr. Cullen to Dr. William Hunter, at that time of high celebrity in London, both as physician and teacher of anatomy, who soon learned to estimate the talents and worth of his young *protégé*. He therefore introduced Dr. Blane to the notice of Lord Holderness, whose private physician he soon became, and he was afterwards appointed to the same office to Lord Rodney. This transition from the service of a peaceful statesman to that of an active naval hero, introduced the Doctor to a wider sphere of medical practice, but to one also of greater danger and trial. When Lord Rodney, in 1780, assumed the command of the West India station, Blane accompanied him, and was present in six naval engagements, in the very first of which he found himself compelled to forego his professional privilege of being a non-combatant. This was in consequence of every officer on deck being killed, wounded, or otherwise employed, so that none remained but himself who could be intrusted with the admiral's orders to the officers serving at the guns. This hazardous employment he cheerfully undertook and ably discharged, receiving a slight wound in its performance. His conduct on this occasion was so gratifying to his lordship, that, at his recommendation, he was at once raised to the important office of physician to the fleet, without undergoing the subordinate grades. On this station, where disease is so prevalent among our seamen, he was unremitting in his attention to the health of the ships' crews, and the success of his efforts was felt by the whole fleet. During this period, also, he found a short interval for gratifying those literary tastes which he had cultivated at college; and his account of the important naval engagement of the 12th of April, 1782, which he sent to Lord Stair, was so distinct and so animated, that it soon found its way into print. This victory, indeed, which Lord Rodney obtained over Count de Grasse off Guadeloupe, was of itself well worthy of admiration; for it not only saved Jamaica, ruined the allied fleet of our enemies in that quarter, and restored the supremacy of the British flag, but was the first great trial of the experiment of breaking the line which Nelson afterwards so successfully adopted. Soon after his return from the West India station, which he left in 1783, Dr. Blane published in London a work entitled *Observations on the Diseases of Seamen*, in one volume 8vo. It contained the results of his own careful experience, and the conclusions he had drawn from the medical returns of the surgeons of the fleet, and abounded with so much sound and practical wisdom upon that important subject, that it soon became a standard work, and was repeatedly reprinted with additional improvements. On his return, it was found that he was precluded from half-pay, on account of his appointment having been made without his having passed the intermediate steps of service. But a still more honourable requital awaited his labours; for, in consequence of a joint application from all the officers on the West India station to the Admiralty, Dr. Blane was rewarded by a pension from the crown, which was afterwards doubled at the suggestion of the lords of the Admiralty. Even this, too, was not the full amount of benefit which he owed to the esteem of his fellow-officers; for one of these, a midshipman of Rodney's fleet—but who was no less a person than the Duke of Clarence, afterwards William IV.

—obtained for him the appointment of physician extraordinary to the Prince of Wales, in 1785; he was also, chiefly through the popular influence of Lord Rodney, elected physician to St. Thomas's Hospital. About the same time, also, he was appointed one of the commissioners of sick and wounded sailors. As he was now on shore, and in prosperous circumstances, he sought a permanent and comfortable home by marriage, and on the 11th July, 1786, was united to Elizabeth, only daughter of Abraham Gardner, merchant. By this lady, who shared with him the honours and comforts of a long life, and whose death preceded his own by only two years, he was the father of six sons and three daughters. Having about the time of his marriage been elected a fellow of the Royal Society, he was appointed, in 1788, to deliver the Croonian lecture of that year, a duty which he performed with signal ability, having chosen *Muscular Motion* for his subject, and illustrated it with great extent of information, as well as much profound and original thinking. The essay was published in 1791, and afterwards republished in his *Select Dissertations*, in 1822 and 1834. In 1790 an essay of his on the "Nardus or Spikenard of the Ancients," was also published in the 80th volume of the *Transactions of the Royal Society*.

More important, however, than all these appointments that were successively conferred upon Dr. Blane, was that of being placed at the head of the navy medical board, which occurred in 1795. It was here that he had full scope and exercise for his talents, philanthropy, and nautical experience as a physician. In proportion as the empire of Britain was extended, the number and length of voyages were increased, so that the draught upon our island population for the royal and merchant service was every year becoming greater. But a still more serious danger than any that arose from storm or battle, was that which originated in scurvy, the ocean-pestilence, from which there had hitherto been no protection, except at the expense of a long delay by recruiting on a friendly shore. The causes of this disease were the cold and unhealthy atmosphere on ship-board, owing to defective ship-building, the sand used for ballast, the unwholesome miasma of the bilge-water, and the imperfect means of washing and ventilating the vessel. But these were trivial compared with the diet of our sailors, which, on long voyages, consisted merely of salted meat and biscuit. The defective nourishment and excessive stimulus of this kind of food made the scurvy still prevalent in our fleets, notwithstanding the improvements by which the other causes were counteracted; and the point and limit seemed to have been already attained, beyond which the British flag could not be carried. "The cure seems impossible by any remedy, or by any management that can be employed," says the historian of Anson's voyage despairingly, when he describes the condition of the commodore's crew on his arrival at Juan Fernandez, where, after a loss of four-fifths of his sailors, he had, out of the 200 survivors, only eight who were capable of duty. It was to root out, or at least to diminish this disease, and bring it under proper management, that Dr. Blane now addressed himself; and in this humane and patriotic purpose he was ably seconded by Earl Spencer, at that time first lord of the Admiralty. The doctor well knew that the only antiscorbutics available for the prevention or cure of sea-scurvy are those vegetables in which acid predominates; and that of all fruits, the genus *Citrus* is most effective. Here, then, was the remedy; and since the fruit could not be carried

fresh during a long voyage, the preserved juice might be used as a substitute. Such was the cure he suggested, and, through the influence of Earl Spencer, it was immediately introduced throughout the whole British navy. Several gallons of lemon juice, having a tenth part of spirit of wine, to preserve it, was supplied to each ship; and in a fortnight after leaving the port the use of it began, each sailor being allowed one ounce of it, with an ounce and a half of sugar, to mix with his grog or wine. The immense advantages of an innovation apparently so very simple—and therefore so very difficult to be discovered—were quickly apparent. In the statistics of our navy we find, that during nine years of consecutive warfare, from 1778 to 1795, the number of men voted for the service by parliament was 745,000, of whom 189,730 were sent sick on shore, or to the hospitals. But during the nine following years of consecutive warfare, that is to say, from 1796, when the use of lime-juice was introduced into the navy, till 1806, during which period 1,053,076 men were voted for sea-service, of these the sick amounted to no more than 123,949. The amount of disease had thus diminished by one-half, because scurvy had almost wholly disappeared; and our fleets, instead of being utterly drained of their seamen, as would have been the case under the former ratio, were enabled for twenty years to go onward in a career of victory unchecked, and repair their losses as fast as they occurred. And the merchant service, too, from which these victories derive their value, has been equally benefited by the remedy of Dr. Blane, so that its vessels may traverse every sea in safety, and return after the longest voyages with a healthy and happy crew; while a spectacle such as had been seen more than once—like that of the *Oriflamme*, for instance, where the whole crew had died, and the deck was piled with the corpses, while not a hand was left to guide her course as she slowly drifted before the wind—would be reckoned as impossible as a realization of the tale of the *Ancient Mariner*.

The famine which prevailed over the whole of Britain during the years 1799 and 1800 was too severe to be easily forgotten by the present generation; and, with the view of directing attention to its alleviation, as well as preventing its recurrence, Dr. Blane published in 1800 an *Inquiry into the Causes and Remedies of the Late and Present Scarcity and High Price of Provisions; with Observations on the Distresses of Agriculture and Commerce which have prevailed for the last Three Years*. As he had now attained a high medical reputation, and enjoyed an extensive private practice in addition to his public duties, he resigned the office of physician to St. Thomas's Hospital, after having held it twenty years. The fruits of his observations during that period he gave to the world in a dissertation "On the Comparative Prevalence and Mortality of different Diseases in London," which was first published in the *Transactions of the Medico-Chirurgical Society*, and afterwards embodied in his *Select Dissertations*. The unhappy Walcheren expedition was one of the last public services on which Blane was employed. That island of fogs, swamps, and pestilential vapours had loomed so alluringly in the eyes of our statesmen, that nothing short of its possession would satisfy them, and one of the largest armaments that had ever left a British port, conveying 40,000 soldiers, was sent to achieve its conquest. It was soon won and occupied; but our troops found, on entering into possession, that a deadlier enemy than any that France could furnish was arrayed against them to dispute their footing; so that, independently of the fearful amount of mortality, 10,000 brave

THE BISHOP OF ...

soldiers were soon upon the sick list. As for the disease, too, which produced such havoc, although it was sometimes called fever, and sometimes ague, neither its nature, causes, nor cure, could be satisfactorily ascertained. All this, however, it was necessary to detect, if our hold was to be continued upon Walcheren; and the chief medical officers of the army were ordered to repair in person to the island, and there hold an inquest upon the malady, with a view to its removal. But no medical Curtius could be found to throw himself into such a gulf: the surgeon-general of the army declared that the case was not surgical, and ought therefore to be superintended by the physician-general; while the latter as stoutly argued, that the duty indisputably belonged not to him, but to the inspector-general of army hospitals. In this way an office reckoned tantamount to a death-warrant, from the danger of infection which it involved, was banded to and fro, while the unfortunate patients were daily sickening and dying by the hundred. One man, however, fully competent for the task, and whose services on such an occasion were completely gratuitous, departed upon the perilous mission. This was Dr. Blane, who, as belonging to a different department, had no such obligations as his army brethren, but who, nevertheless, undertook the obnoxious duty in 1809, while the disease was most prevalent. It is perhaps unnecessary to add, that the British soon after abandoned their possession of Walcheren.

Another public service on which Dr. Blane was employed in the following year (1810), was to visit Northfleet, and report on the expediency of establishing a dockyard and naval arsenal there. This terminated his public official labours, which were so highly valued that in 1812 he was raised to the rank of baronet, and appointed in the same year physician-in-ordinary to the prince regent. In 1819 he reappeared as an author, by the publication of *Elements of Medical Logic*, the most useful of his writings, and one so highly prized that, in the course of a few years, it went through several editions. In 1821, having now for two years been past the "three-score and ten" that constitute the common boundary of human life, he suffered under the effects of old age in the form of *prurigo senilis*, for which he was obliged to take such copious doses of opium, that he became a confirmed opium eater; but this habit, so fatal in most instances, seems in him to have been counteracted by the disease which it alleviated, for he continued to the last in full possession and use of his intellectual faculties. In 1822 he published *Select Dissertations on Several Subjects of Medical Science*, most of which had previously appeared in the form of separate papers in the most important of our medical periodicals. In 1826 he was elected a member of the Institute of France. Although a long period of peace had now occurred, his zeal for the welfare of the navy still continued. This he had first manifested on his being placed at the head of the navy medical board, when he caused regular returns or journals of the state of health and disease to be kept by every surgeon in the service, and forwarded to the navy board, from which returns he drew up those dissertations that were read before the Medico-Chirurgical Society, and published in its *Transactions*. But anxious still more effectually to promote emulation and reward merit in the medical department of the British naval service, he founded in 1829, with the sanction of the lords of the Admiralty, a prize medal for the best journal kept by the surgeons of his Majesty's navy. This medal is awarded every second year, the commissioners selecting four of the best journals for competition. On

the accession of William IV. to the throne in 1830, the sovereign was not forgetful of his old shipmate, and Sir Gilbert was appointed first physician to the king. Fully rewarded with wealth and honours, and laden with years, Sir Gilbert Blane could now retire gracefully from the scene of public life, and leave his place to be filled by younger men; and this he did in a manner that was consistent with his previous career. The whole island was filled with consternation at the coming of the cholera, and the havoc which it wrought wherever it appeared, upon which he published a pamphlet in 1831, entitled *Warning to the British Public against the Alarming Approach of the Indian Cholera*. After this he retreated, at the age of eighty-two, into peaceful retirement, where he solaced his leisure hours in revising and preparing for publication the second edition of his *Select Dissertations*, which issued from the press before he died. His death occurred on the 26th of June, 1834, in the eighty-fifth year of his age.

BOECE, HECTOR, whose name was otherwise spelled Boyis, Boyes, Boiss, and Boice, an eminent, though credulous historian, was born about the year 1465-6 at Dundee, and hence he assumed the surname of Deidonanus. His family were possessed of the estate of Panbride, or Balbride, in the county of Angus, which had been acquired by his grandfather, Hugh Boece, along with the heiress in marriage, in consequence of his services to David II. at the battle of Dupplin. The rudiments of his education he received in his native town, which at that time, and for a long time after, was celebrated for its schools: he afterwards studied at Aberdeen, and finally at Paris, where, in 1497, he became a professor of philosophy in the college of Montacute. Of a number of the years of his life about this period there is evidently nothing to be told. The garrulous and sometimes fabling Dr. Mackenzie has filled up this part of his life with an account of his fellow-students at Paris—all of whose names, with one exception, have sunk into oblivion. That exception is the venerated name of Erasmus, who, as a mark of affection for Boece, dedicated to him a catalogue of his works, and maintained with him in after-life as regular a correspondence as the imperfect communication of those times would permit. In the year 1500 Bishop Elphinstone, who had just founded the college of Aberdeen, invited Boece home to be the principal. The learned professor, reluctant to quit the learned society he enjoyed at Paris, was only persuaded to accept this invitation, as he informs us himself, "by means of gifts and promises;" the principal inducement must of course have been the salary, which amounted to forty merks a year—equal to two pounds three shillings and fourpence sterling—a sum, however, which Dr. Johnson remarks, was then probably equal, not only to the needs, but to the rank of the president of King's College.

On his arrival at Aberdeen he found, among the chanoons regular, a great many learned men, and became a member of their order. From this order, indeed, the professors seem to have been selected. As colleague in his new office, Hector Boece associated with himself Mr. William Hay, a gentleman of the shire of Angus, who had studied along with him under the same masters both at Dundee and Paris. Alexander Hay, a chanon of Aberdeen, was the first teacher of scholastic theology in that university. David Guthry and James Ogilvy are mentioned as professors of civil and canon law; but whether they were contemporary teachers or succeeded each other in the same chair, is not quite clear. Henry Spital

was the first who taught philosophy at Aberdeen, and for this purpose he wrote *An Easy Introduction to the Philosophy of Aristotle*. Another of the learned professors was Alexander Galloway, rector of Kinkell, who was author of a treatise on the *Æbudæ* or Western Isles, with an account of the *Clag* or *Claik Geese*, and the trees upon which they were found to grow; a work no longer to be found, but the best parts of which are probably embodied in Boece's *History of Scotland*. Arthur Boece, brother to the principal, was also one of his assistants. He was a tutor of the canon law, and a licentiate in the civil; a man of great eloquence and singular erudition. Besides these, Boece has commemorated several others, who were his assistants, and reflected lustre upon the dawn of learning in the north. Some of them were, according to the learned principal's account, men of high eminence, whose influence was great in the days in which they lived, and whose example extended even to after-ages. He particularly refers to John Adam, who was the first to receive the degree of Doctor of Theology in the university; after which he was made principal of the Dominican order, which, from the vicious lives, the poverty and the ignorance of its members, had sunk into great contempt, but which he raised into high respectability, both for piety and learning. On the death of his patron, Bishop Elphinstone, in 1514, Boece, out of gratitude for his friendship and respect for his great learning and exemplary virtue, resolved to give to the world an account of his life, in composing which he was so struck with the exemplary conduct of others who had filled that see, that he determined to write the history of the lives of the whole of the bishops of Aberdeen. This laborious undertaking he completed in Latin, after the custom of the age, and gave to the world in the year 1522. It was printed at Paris by Badius Ascensius.

His next, and by far his greatest work, was a *History of Scotland*, from the earliest accounts. To this work he was probably stimulated by the example of John Mair or Major, a tutor of the Sorbonne, and principal of the college of St. Salvadore at St. Andrews, whose *History of Scotland*, in six books, was published at Paris in the year 1521. The *Scotch Chronicon* had been originally written by John Fordun, a canon of Aberdeen, and continued by Walter Bower or Bowmaker to the death of James I., nearly a century previous to this, as had also the metrical *Chronykil* of Scotland by Andrew Winton, prior of Lochleven, but all of them written in a style beneath the dignity of history, and disguised by the most contemptible fables. Mair was more studious of truth, but his narrative is meagre and his style loose and disjointed. Boece was a man of high talent, and one of the best Latin scholars which his country has at any period produced; but he was credulous in a high degree, and most unquestionably has given his authority, such as it was, to many fables, if he did not himself absolutely invent them; and he has rested the truth of his facts upon authors that never existed except in his own imagination. Of the *Inglis Iyis*, which Buchanan complains had cost him so much trouble to purge out of the *Story of Scotland*, perhaps he had not preserved the greatest number, but he certainly had more of the *Scottis vanitie* than even that great man was willing to part with. In imitation of some other historians he has introduced his history with the cosmography of the country, in which he has been followed by Buchanan. Some passages we have selected from this part of the work, illustrative of his taste for, and his knowledge of, natural history. The extracts are taken from the translation of John Bellenden, archdeacon

of Murray, which was made for the benefit of King James V., who, from a defective education, was unable to read the original. That they may afford the reader a genuine specimen of our ancient Scottish prose, we have given these few extracts in their original orthography. The first is the result of the inquiries of Hector Boece into the claiicks or claggeese that were supposed to grow upon trees.

"Sum men belevit that thir claiiks grows on treis by the nobbis, bot thair opinion is vane. And because the nature and procreation of thir claiiks is strange, we have maid na little laubore and diligence to serch the truth and veritie thairof. We have sailit throw the seis quhare they ar brede, and find by grit experience that the nature of the seis is maire relevant cause of their procreation thany ony other thyng; for all treis that are cussen in the seis be process of tyme apperis first worme etin, and in the small hollis and boris thairof growis small wormis. First they schaw thair heid and feit, and last of all they schaw thair plumis and wings. Finally, quhen they are cumin to the just measure and quantitie of geis, they fle in the aire as othir fowlis. Thairfore because the rude and ignorant pepyll saw oftymes the fruitis that fell off the treis quhilk stude nair the see, convertit within short tyme in geis, they belevit that thir geis grew upon the treis hing-and be thair nobbis, sic like as apillis and uthir fruitis, bot thair opinion is nocht to be sustaint." This absurd nonsense is by the vulgar in some places believed to this day. The barnacle has somewhat the appearance of a fowl in miniature inclosed in a shell, and this they suppose to be the young of the claik-goose. The following will not appear less wonderful to the greater part of readers than the procreation of the claiiks. "The wolffis ar richt noysum to the tame bestial in all parts of Scotland, except ane pair thairof, named Glenmore; in quhilk the tame bestial gets lytill damage of wyld bestial, especially of toddis. For ilk hous nurises ane young todd certane days, and mengis the fleshe thairof after it be slane, with sic meit as they gif to thair fowlis or uthir small beistis, and sae mony as eits of this meit ar preservit twa months after fra ony damage be the toddis, for toddis will gust na fleshe that gusts of thair ain kynd; and be thair bot ane beist or fowl that has nocht gustit of this meit the todd will chais it out amang ane thousand."

Could the following art be rediscovered it would be a great saving in the article barley, and would besides render the malt-duty of non-effect. "In all the desertis and muires of this realme growis an herbe namit hadder, bot [without] ony seid, richt nutritive baith to beistis and fowlis, speciallie to beis. This herbe, in the month of Julie, has ane floure of purple hew, als sweet as honey. The Pychts maid of this herbe sum tyme ane richt delicious and halsume drynk, nochttheless the maner of the making of it is perist be the extermination of the said Pychtis, for they schaw nevir the craft of the making of this drink bot to thair awn blude."

Of the miraculous the two following are tolerable specimens. "In Orkney is ane grit fische, mair than onie hors, of marvelous and incredible sleip. This fische, whan she begins to sleip, fensis hir teith fast on ane crag above the water. Als soon as the marineris fynes hir on sleip, they come with ane stark cabill in ane boat, and efter they have borit ane hole threw hir tail, they fensie hir to the samyn. Als soon as this fische is awalkit, she maks her to loup with grit fure into the see, and fra she fynd hirself fast she wrythis hir out of her awn skin and deis. Of the fatness that scho hes is maid oulie in grit quantitie, and of hir skin is maid strang cabills."

"In Murrayland, in the kirke of Pette, the bairns of lyttill John remains in grit admiration of the pepill. He has been fourteen seit of height, with square members effeiring thairto. Sax years afore the cumin of this werk to light, we saw his hansh bain als meikle as the hail bain of ane man, for we shut our arm in the mouth thairfo, by quhilk appeirs how strang and square pepill grew in our region afore they war effeminat with lust and intemperance of mouth."

Perhaps, after all, the last paragraph of Boece's *Cosmography of Scotland* might have been sufficient to attest his character: "Thus it were needful to put an end to our cosmographie, were not an uncouth history tarryis a littill my pen. Mr. Jame Ogilby, with uther nobylmen, we send as ambassatouris frae the maist nobill prince King James the feird to the Kyng of France, and be tempest of see they war constraint to land in Norway, quhare they saw nocht far fra thaim mony wild men nakit and ruch, on the sam maner as they war painted. At last they got advertising bylandwart pepill that they war doum beestis under the figur of men, quha in tyme of nicht usit to come in grit companies to landwart villages, and quhan they fand na doggis they brek up doris, and slays all the pepill that they fynd thair intill. They are of sa huge strenth that they pull up treis by the rutis and fechts thairwith amang thaimself. The ambassatouris war astonist at thir monstonis, and made strick watches with grit fyres birnand all nicht, and on the morrow they pulit up sails and depairtit. Forther, the Norway men schow that there was also nocht far fra thaim an pepill that swomit all the symer, like fische in the see, leifand on fische, bot in the winter, because the water is cauld, they leif upon wild beistis that descendis fra the mountainis, and sa endis here the *Cosmography of Scotland*." Such are specimens of what passed for veritable history in Scotland scarcely three centuries ago, and such was the weakness of a man who was certainly in his own day, even by foreigners, reckoned an ornament to his country. The truth is, knowledge in those days was most deplorably limited by the difficulty of travelling, and the paucity of books. A geographical writer sat in his study, ignorant personally of everything except what was immediately around him, and liable to be imposed upon by the stories of credulous or lying travellers, which he had no means of correcting or disproving. The philosophical writer was equally liable to be imposed upon by false and superstitious systems, which the age produced in great abundance.

Boece's history was published at Paris in 1526, in a folio volume, under the title of *Scotorum Historie, a Prima Gentis Origine, cum Aliarum et Rerum et Gentium Illustratione non Vulgari*. This edition, which was printed by Badius, contains seventeen books. A second was printed at Lausanne, and published at Paris in 1574, about forty years after the death of Boece. In this were added the eighteenth and part of a nineteenth book, written by himself; and a continuation of the history to the end of the reign of James III., by Ferrarius, a learned Piedmontese, who came to Scotland in 1528, in the train of Robert Reid, abbot of Kinloss, and afterwards Bishop of Orkney.

Soon after the publication of his history (1527), James V. bestowed upon Boece a pension of £50 Scots yearly, which was to be paid by the sheriff of Aberdeen out of the king's casualties. Two years afterwards a new precept was issued, directing this pension to be paid by the customers of Aberdeen, until the king should promote him to a benefice of 100 merks Scots of yearly value. By a subsequent

regulation, the pension was partly paid by the king's comptroller, and partly by the treasurer.

As the payment appears for the last time in the treasurer's books for 1534, it is probable that about that time the king carried into effect his intention of exchanging the pension for a benefice. The benefice so given was the rectory of Fyvie in Aberdeenshire, which Boece held at his death in 1536, as appears from the record of the presentation of his successor. According to Gordon of Straloch, the death of the reverend historian happened at Aberdeen; he was then about seventy years of age.

In estimating the character of Hector Boece, many circumstances must be taken into account. It is certainly impossible to read his history without feeling contempt for his understanding as well as for his veracity; yet when we consider the night of ignorance, imbecility, and error in which he lived, contempt gives place to strong compassion, and we feel disposed to apologize for, rather than to blame him. Lord Hailes has bitterly remarked that the Scots were reformed from Popery, but not from Boece, and Pinkerton inveighs against him as "the most egregious historical impostor that ever appeared in any country!" It is enough, however, for the vindication of this elegant writer, that he fulfilled all the duties that could be demanded from a historian in his own time, and could not be expected, to use a more just expression of Dalrymple, to be a philosopher before philosophy revived. That he was incapable of designed imposture, appears incontestably proved by the testimonies of his contemporaries; Erasmus in particular styling him a man who "knew not what it was to make a lie."

The highest honours have been bestowed upon the learning and genius of Boece, by the most distinguished men of his own and the subsequent age, among whom it is enough to mention Paul Jovius, Joannes Gualterius, Bishop Lesly, Archbishop Spotswood, and Buchanan. Bartholomew Latomas, a well-known annotator on Cicero, Terence, and Horace, honoured his memory by a beautiful Latin epitaph, of which the following English translation will give some faint idea:—

"That in this tomb the never-fading light
Streams bright from blazing torches unconsumed.
Art thou amazed, and would'st thou read aright?
Hector Boethius, know, lies here inhumed.
He who his country's hills and vales illumed
With all the lustre of the Latian lore,
Chasing the shades of darkness deep, fore-doom'd,
Beyond the freezing pole and Thule's shore,
For this adorn'd, graceful in Roman dress,
Deserved thanks the Scottish Muses pay
To him who gave them life—decreasing thus
Upon his tomb unfading light shall play,
From torches burning bright, that ne'er shall know decay."

BOGUE, DAVID, the father, as he has been called, of the London Missionary Society, was born at Hallydown in the parish of Coldingham, Berwickshire, on the 18th February, 1750. His father, who farmed his own estate, was descended of a respectable family which had been long settled in the country. His studies are said to have been carried on at Dunse under the superintendance of the distinguished Cruikshanks, not less remembered for the success of his tuition, than for the severity of his discipline. He afterwards removed to the university of Edinburgh, and studied moral philosophy under Adam Ferguson, the well-known author of the *History of Civil Society*. After undergoing the usual course of study, and being licensed as a preacher in connection with the Church of Scotland, from want, perhaps, of very flattering prospects in his native country, he removed to London (1771), and was for some time

employed in the humble, but meritorious, capacity of usher in an academy at Edmonton, afterwards at Hampstead, and finally with the Rev. Mr. Smith of Camberwell, whom he also assisted in the discharge of his ministerial duties both at Camberwell and at Silver Street, London, where he held a lectureship, the duties of which were at one time performed by the celebrated John Home. The zeal with which Mr. Bogue discharged his duties in both of these capacities, contributed not less to the satisfaction of Mr. Smith, than to the increase of his own popularity. At length, on the resignation of the minister of an Independent chapel at Gosport, Mr. Bogue was unanimously chosen to fill the vacant charge. The duties of his new situation were such as to require all the strength of judgment and uncompromising inflexibility, tempered with Christian meekness, which entered so largely into his character. The charge was one of great difficulty, and of peculiar importance. The members of the congregation were divided among themselves, and part of them had indeed withdrawn from the communion altogether, during the ministry of his predecessor, and formed themselves into a separate congregation, under a rival minister; but the exemplary conduct of Mr. Bogue, and his zeal in the discharge of his duties, were such, that he had scarce occupied the pulpit twelve months when a reunion was effected. His fame as a solid and substantial scholar, and an evangelical and indefatigable minister, now spread rapidly; and in 1780 he became tutor to an establishment for directing the studies of young men destined for the Christian ministry in connection with the Independent communion. For the ability with which this establishment was conducted, both now and when it afterwards became a similar one for those destined for missionary labours, his praise is indeed in all the churches. It was in this period, though occupied with the details of what most men would have felt as a full occupation of their time, that his ever-active mind turned its attention to the formation of a grand missionary scheme, which afterwards resulted in the London Missionary Society. The influence of this institution was extensive, and the springing up of the British and Foreign Bible Society and the Religious Tract Society at short intervals, proves how much good was effected by the impetus thus given by one master-mind. In the establishment of both of these he likewise took an active part, contributing to the latter body the first of a series of publications which have been of great usefulness. In the year 1796 Mr. Bogue was called upon to show whether he who had professed himself such a friend to missionary enterprise, was sufficiently imbued with the spirit of the gospel to enable him to forsake home and the comforts of civilized society, to devote himself to its sacred cause. The call alluded to was made—and it was not made in vain—by Robert Haldane, Esq., of Airthrie, who, to furnish funds for this grand enterprise, sold his estate. Their design was, in conjunction with two other divines, who had recently left the Established Church of Scotland and become Independent ministers, to preach the gospel to the natives of India, and likewise to form a seminary for the instruction of fellow-labourers in the same field. The names of the two other ministers were the Rev. Greville Ewing of Glasgow, and the Rev. W. Innes of Edinburgh. But the design was frustrated by the East India Company, who refused their sanction to the undertaking—a most fortunate circumstance, as it afterwards appeared, in as far as the missionaries were individually concerned; for a massacre of Europeans took place at the exact spot where it was intended

the mission should have been established, and from which these Christian labourers could scarcely have hoped to escape. In 1815 Mr. Bogue received the diploma of Doctor of Divinity from the senatus academicus of Yale college, North America.

His zeal for the cause of missions, to which he consecrated his life, continued to the last: he may truly be said to have died in the cause. He annually made tours, in different parts of the country, in behalf of the Missionary Society; and it was on a journey of this kind, in which he had been requested to assist at a meeting of the Sussex Auxiliary Society, that he took ill at the house of the Rev. Mr. Goulty of Brighton, and, in spite of the best medical advice, departed this life on the morning of the 25th of October, 1825, after a short illness. The effect of this event upon the various churches and religious bodies with which Dr. Bogue was connected, was great: no sooner did the intelligence reach London, than an extraordinary meeting of the Missionary Society was called (October 26), in which resolutions were passed expressive of its sense of the bereavement, and of the benefits which the deceased had conferred upon the society, by the active part he had taken in its projection and establishment, and subsequently "by his prayers, his writings, his example, his journeys, and, above all, by his direction and superintendance of the missionary seminary at Gosport."

The only works of Dr. Bogue are, *An Essay on the Divine Authority of the New Testament, Discourses on the Millennium*, and a *History of Dissenters*, which he undertook in conjunction with his pupil and friend Dr. Bennet. The first of these he commenced at the request of the London Missionary Society, with the purpose of its being appended to an edition of the New Testament, which the society intended to circulate extensively in France. In consideration of the wide diffusion of infidelity in that country, he wisely directed his attention to the evidence required by this class of individuals—addressing them always in the language of kindness and persuasion, "convinced," as he characteristically remarks, "that the wrath of man worketh not the righteousness of God,"—and if usefulness be taken as a test of excellence, this work is so in a very high degree. No work of a religious character, if we except perhaps the *Pilgrim's Progress*, has been so popular: it has been translated into the French, Italian, German, and Spanish languages, and has been widely circulated on the Continent of Europe, where, under the divine blessing, it has been eminently useful. In France, in particular, and on the distant shores of America, its influence has been felt in the convincing and converting of many to the cause of Christ. It is, indeed, the most useful of all his works. The discourses on the millennium are entirely practical and devotional, and though they want the straining for effect, and the ingenious speculations with which some have clothed this subject, and gained for themselves an ephemeral popularity—for to all such trickery Dr. Bogue had a thorough aversion—they will be found strikingly to display the enlarged views and sterling good sense of their venerable author.

BOSTON, THOMAS, an eminent doctrinal writer, was born in the town of Dunse, March 7, 1676, and received the rudiments of his education at his native town, first under a woman who kept a school in his father's house, and afterwards under Mr. James Bullerwill, who taught what is called the grammar-school. His father was a nonconformist, and, being imprisoned for his recusancy, retained the subject of

this memoir in prison along with him, for the sake of company, which, notwithstanding his youth, seems to have made a lasting impression on the memory of young Boston. Whether the old man was brought at length to conform, we have not been able to learn; but during his early years, Mr. Boston informs us that he was a regular attendant at church, "where he heard those of the Episcopal way, that being then the national establishment." He was then, as he informs us, living without God in the world, and unconcerned about the state of his soul. Toward the end of summer, 1687, upon the coming out of King James's indulgence, his father carried him to a Presbyterian meeting at Whitsome, where he heard the Rev. Mr. Henry Erskine, who, before the restoration, was minister of Cornhill, and father to the afterwards celebrated Messrs. Ralph and Ebenezer Erskine. It was through the ministrations of this celebrated preacher that Boston was first brought to think seriously about the state of his soul, being then going in the twelfth year of his age. After this he went back no more to the church till the curates were expelled. While at the grammar-school he formed an intimacy with two boys, Thomas Trotter and Patrick Gillies, who regularly met with him, at stated times, in a chamber of his father's house, for reading the Scriptures, religious conference, and social prayer, "whereby," he says, "they had some advantage, both in point of knowledge and tenderness." Mr. Boston made a rapid progress at the school, and before he left it, which was in the harvest of 1689, had gone through all the books commonly taught in such seminaries, and had even begun the Greek, in which language he had read part of John's Gospel, Luke, and the Acts of the Apostles, though he was then but in his fourteenth year. After leaving the grammar-school two years elapsed before he proceeded farther in his studies, his father being doubtful if he was able to defray the expense. This led to several attempts at getting him into a gratuitous course at the university, none of which had any success. In the meantime he was partly employed in the composing and transcribing law papers by a Mr. Cockburn, a public notary, from which he admits that he derived great benefit in after-life. All his plans for a gratuitous academic course having failed, and his father having resolved to strain every nerve to carry him through the classes, he entered the university of Edinburgh as a student of Greek, December 1, 1691, and studied for three successive sessions. He took out his laurea-tion in the summer of 1694, when his whole expenses for fees and maintenance were found to amount to one hundred and twenty-eight pounds, fifteen shillings and eight pence, Scots money, less than £11 sterling. That same summer he had the bursary of the presbytery of Dunse conferred on him as a student of theology, and in the month of January, 1695, entered the theological class in the college of Edinburgh, then taught by Mr. George Campbell, "a man," says Boston, "of great learning, but excessively modest, undervaluing himself, and much valuing the tolerable performances of his students." During this session—the only one Boston appears to have regularly attended in divinity—he also for a time attended the Hebrew class taught by Mr. Alexander Rule, but remarks that he found no particular advantage from it. After returning from the university, Mr. Boston had different applications made to him, and made various attempts to settle himself in a school, but with no good effect; and in the spring of 1696 he accepted of an invitation from Lady Mersington to superintend the education of her grandchild, Andrew Fletcher of Aberlady, a boy of nine years of age, whose father having died young, his mother

was married again to Lieutenant-colonel Bruce of Kennet, in Clackmannanshire. This he was the rather induced to undertake, because the boy being in Edinburgh at the high-school, it gave his preceptor the power of waiting upon the divinity lectures in the college. In less than a month, however, his pupil was taken home to Kennet, whither Boston accompanied him, and never had another opportunity of attending the college. In this situation Mr. Boston continued for about a year, and during that period was pressed, once and again, by the united presbyteries of Stirling and Dumblane to take license as a preacher, which, for reasons not very obvious, he declined. In the month of March, 1697, he returned to Dunse, and by his friend Mr. Colden, minister of that place, was induced to enter upon trials for license before the united presbyteries of Dunse and Churnside, by which he was licensed as a probationer in the Scottish Church, June 15, 1697. In this character Mr. Boston officiated, as opportunity offered, for two years and three months, partly within the bounds of his native presbytery, and partly within the bounds of the presbytery of Stirling. It was first proposed by his friends of the presbytery of Dunse to settle him in the parish of Foulden, the Episcopal incumbent of which was recently dead; and, on the first day he officiated there, he gave a remarkably decisive proof of the firmness of his principles. The Episcopal preceptor was, under the protection of the great men of the parish, still continued. Boston had no freedom to employ him without suitable acknowledgments, which, not being clothed with the ministerial character, he could not take. On the morning, therefore, of the first Sabbath, he told this official that he would conduct the psalmody himself, which accordingly he did, and there was nothing said about it. In the parish of Foulden, however, he could not be settled without the concurrence of Lord Ross, who had had a great hand in the enormous oppressions of the preceding period. A personal application on the part of the candidate was required by his lordship, and the presbytery were urgent with Boston to make it, but to this he could not bring his mind, so the project came to nothing. He was next proposed for the parish of Abbey; but this scheme also was frustrated through the deceitfulness of the principal heritor, who was a minister himself, and found means to secure the other heritors, through whose influence he was inducted by the presbytery to the living, though the parishioners were reclaiming, and charging the presbytery with the blood of their souls if they went on with the settlement. "This," remarks Boston, "was the ungodly way of settling that even then prevailed in the case of planting of churches—a way which I ever abhorred." After these disappointments Mr. Boston removed to his former situation in Clackmannanshire, where he remained for a twelvemonth, and in that time was proposed for Carnock, for Clackmannan, and for Dollar, all of which proposals were fruitless, and he returned to Dunse in the month of May, 1699.

Mr. Boston had no sooner returned to his native place than he was proposed by his friend Mr. Colden for the parish of Simprin, where, after a great deal of hesitation on his part, and some little chicanery on the part of the presbytery and the people, he was ordained minister, September 21, 1699. In Simprin he continued conscientiously performing the duties of his calling till the year 1707, when, by synodical authority, he was transported to Ettrick. His introduction to his new charge took place on the 1st of May that year, the very day when the union between Scotland and England took effect; on which account

he remarks that he had frequent occasion to remember it, the spirits of the people of Ettrick being imbittered on that event against the ministers of the church, which was an occasion of much heaviness to him, though he had never been for the union, but always against it from the very beginning. Simprin, now united to the parish of Swinton, both of which make a very small parish, contained only a few families, to whose improvement he was able greatly to contribute with comparatively little exertion, and the whole population seem to have been warmly attached to him. Ettrick, on the contrary, is a parish extending nearly ten miles in every direction, and required much labour to bring the people together in public, or to come in contact with them at their own houses. Several of them, too, were society men or old dissenters, who had never joined the revolution church from what they supposed to be radical defects in her constitution, as well as from much that had all along been offensive in her general administration. Of her constitution, perhaps, Mr. Boston was not the warmest admirer, for he has told us in his memoirs, that, after having studied the subject of baptism, he had little fondness for national churches, strictly and properly so called, and of many parts of her administration he has again and again expressed decided disapprobation; but he had an undefined horror at separation, common to the greater part of the Presbyterians of that and the preceding generation, which led him to regard almost every other ecclesiastical evil as trifling. He was, however, a conscientious and diligent student, and had already made great progress in the knowledge of the doctrine of grace, which seems to have been but imperfectly understood by many very respectable men of that period. In this he was greatly forwarded by a little book, *The Marrow of Modern Divinity*, which he found by accident in the house of one of his parishioners in Simprin, and which had been brought from England by a person who had been a soldier there in the time of the civil wars. Of this book he says, "I found it to come close to the points I was in quest of, and showed the consistency of those which I could not reconcile before, so that I rejoiced in it as a light which the Lord had seasonably struck up to me in my darkness." The works of Jerome, Zanchius, Luther on the *Galatians*, and Beza's *Confession of Faith*, which he seems to have fallen in with at the same period (that is, while he was yet in Simprin, about the year 1700), also contributed greatly to the same end, and seems to have given a cast of singularity to his sermons, which was highly relished, and which rendered them singularly useful in promoting the growth of faith and holiness among his hearers. In 1702 he took the oath of allegiance to Queen Anne, the sense of which, he says, he endeavoured to keep on his heart, but never after took another oath, whether of a public or private nature.

Boston was a member of the first General Assembly held under that queen in the month of March, 1703, of which, as the person that was supposed to be most acceptable to the commissioner, the Earl of Seafield, Mr. George Meldrum was chosen moderator. The declaration of the intrinsic power of the church was the great object of the more faithful part of her ministers at this time; but they were told by the leading party that they already possessed it, and that to make an act asserting what they possessed, was only to waste time. While this very Assembly, however, was in the midst of a discussion upon an overture for preventing the marriage of Protestants with Papists, the commissioner, rising from his seat, dissolved the Assembly in her majesty's name. "This having

come," Boston remarks, "like a clap of thunder, there were from all corners of the house protestations offered against it, and for asserting the intrinsic power of the church, with which," he adds, "I joined in: but the moderator, otherwise a most grave and composed man, being in as much confusion as a schoolboy when beaten, closed with prayer, and got away together with the clerk, so that nothing was then got marked. This was one of the heaviest days," he continues, "that ever I saw, beholding a vain man trampling under the privileges of Christ's house, and others crouching under the burden; and I could not but observe how Providence rebuked their shifting the act to assert as above said, and baffled their design in the choice of the moderator, never a moderator since the revolution to this day, so far as I can guess, having been so ill-treated by a commissioner." This reflection in his private journal, however, with the exception of an inefficient speech in his own synod, appears to be all that ever Boston undertook for the vindication of his church on this occasion. It does not indeed appear that his feelings on this subject were either strong or distinct, as we find him at Ettrick, in the month of January, 1708, declaring that he had no scruple in observing a fast appointed by the court, though he thought it a grievance that arose from the union and the taking away of the privy council. On this occasion he acknowledges that many of his hearers broke off and left him, several of whom never returned; but he justifies himself from the temper of the people, who, had he yielded to them in this, would have dictated to him ever afterwards. This same year he was again a member of the General Assembly, where application was made by persons liable to have the abjuration oath imposed upon them for an act declaring the judgment of the Assembly regarding it. The Assembly refused to do anything in this matter; which was regretted by Mr. Boston, and he states it as a just retribution which brought it to ministers' own doors in 1712, only four years afterwards. On this occasion also he was in the Assembly, but whether as a spectator or a member he does not say. The lawfulness of the oath was in this Assembly keenly disputed, and Boston failed not to observe that the principles on which the answers to the objection were founded were of such latitude, that by them any oath might be made passable. They were indeed neither more nor less than the swearer imposing his own sense upon the words employed, which renders an oath altogether nugatory. In this manner did Principal Carstairs swear it before the justices in Edinburgh, to the great amusement of the Jacobites, and being clear for it, he, in the Assembly, by his singular policy, smoothed down all asperities, and prevented those who had not the same capacity of conscience from coming to anything like a rupture with their brethren, for which cause, says Boston, I did always thereafter honour him in my heart! Boston, nevertheless, abhorred the oath, and could not bring his mind to take it, but determined to keep his station in the church till thrust out of it by the civil authorities. He made over to his eldest son a house in Dunse, which he had inherited from his father, and made an assignation of all his other goods to his servant, John Currie, so that, when the law took effect, he might elude the penalty of five hundred pounds sterling that was attached to the neglect or the refusal to take the oath within a prescribed period. The memory of the late persecuting reigns was, however, still fresh, and no one appeared willing to incur the odium of imitating them; and, so far as we know, the penalty was never in one single instance exacted. The

subject of this memoir, at least, was never brought to any real trouble respecting it.

Amid all Mr. Boston's attention to public affairs he was still a most diligent minister; and instead of relaxing anything of his labours since leaving Simprin, had greatly increased them by a habit he had fallen into of writing out his sermons in full, which in the earlier part of his ministry he scarcely ever did. This prepared the way for the publication of his sermons from the press, by which they have been made extensively useful. The first suggestion of this kind seems to have come from his friend Dr. Trotter, to whom he paid a visit at Dunse, after assisting at the sacrament at Kelso, in the month of October, 1711; on which occasion the notes of the sermons he had preached on the state of man were left with the Doctor for his perusal, and they formed the foundation of that admirable work, *The Fourfold State*, which was prepared for publication before the summer of 1714, but was laid aside for fear of the Pretender coming in and rendering the sale impossible. In the month of August, the same year, he preached his action sermon from Hosea ii. 19; which met with so much acceptance, that he was requested for a copy with a view to publication. This he complied with, and in the course of the following winter it was printed under the title of *The Everlasting Espousals*, and met with a very good reception, 1200 copies being sold in a short time, which paved the way for the publication of *The Fourfold State*, and was a means of urging him forward in the most important of all his public appearances, that in defence of the *Marrow of Modern Divinity*.

During the insurrection of 1715 he was troubled not a little with the want of military ardour among his parishioners of Etrick, and in the year 1717 with an attempt to have him, altogether against his inclination, transported to the parish of Closeburn, in Dumfriesshire. In the meantime, *The Fourfold State* had been again and again transcribed, and had been revised by Mr. John Flint at Edinburgh; and, in 1718, his friends, Messrs. Simson, Gabriel Wilson, and Henry Davidson, offered to advance money to defray the expense of its publication. The MS., however, was sent at last to Mr. Robert Wightman, treasurer to the city of Edinburgh, who ultimately became the prefacer and the publisher of the book, with many of his own emendations, in consequence of which there was a necessity for cancelling a number of sheets and reprinting them, before the author could allow it to come to the public; nor was it thoroughly purged till it came to a second edition. The first came out in 1720.

The oath of abjuration, altered, in a small degree, at the petition of the greater part of the Presbyterian nonjurors, was again imposed upon ministers in the year 1719, when the most of the ministers took it, to the great grief of many of their people, and to the additional persecution of the few who still wanted freedom to take it, of which number Mr. Boston still continued to be one. Mr. Boston was at this time employed by the synod to examine some overtures from the Assembly regarding discipline; and having been, from his entrance on the ministry, dissatisfied with the manner of admitting to the Lord's table and planting vacant churches, he set himself to have these matters rectified, by remarks upon, and enlargements of these customs. The synod did not, however, even so much as call for them, and, though they were by the presbytery laid before the commission, they were never taken into consideration. "And I apprehend," says Boston, "that the malady will be incurable till the present constitution be violently thrown down." Though the judicatures

were thus careless of any improvement in discipline, they were not less so with regard to doctrine. The Assembly, in 1717, had dismissed Professor Simson, without censure, though he had gone far into the regions of error; and they condemned the whole presbytery of Auchterarder for denying that any pre-requisite qualification was necessary on the part of the sinner for coming to Christ; and this year, 1719, they, at the instigation of Principal Haddow of St. Andrews, commenced a prosecution against Mr. James Hog of Carnock, who had published an edition of the *Marrow*, Alexander Hamilton, minister of Airth, James Brisbane, minister at Stirling, and John Warden, minister at Gargunock, who had advocated its principles: which ended in an act of the General Assembly, forbidding all under their inspection in time coming to teach or preach any such doctrines. This act of Assembly was by Boston and his friends brought before the presbytery of Selkirk, who laid it before the synod of Merse and Teviotdale. Nothing to any purpose was done in the synod; but the publicity of the proceedings led to a correspondence with Mr. James Hog, Mr. Ralph Erskine, and others, by whom a representation and petition was given in to the Assembly, 1721. This representation, however, was referred to the commission. When called before the commission, on Thursday, May 18, Mr. Hog not being ready, and Mr. Bonar of Torphichen gone home, Mr. Boston had the honour of appearing first in that cause. On that day they were borne down by universal clamour. Next day, however, Principal Haddow was closely pushed in argument by Mr. Boston, and Logan of Culcross was completely silenced by Mr. Williamson of Inveresk. The commission then gave out to the twelve representing brethren twelve queries, to which they were required to return answers against the month of March next. These answers, luminous and brief beyond anything of the kind in our language, were begun by Mr. Ebenezer Erskine, but greatly extended and improved by Mr. Gabriel Wilson of Maxton. For presuming thus to question the acts of Assembly, the whole number were admonished and rebuked. Against this sentence they gave in a protestation, on which they took instruments in due form; but it was not allowed to be read. In the meantime, Mr. Boston prepared an edition of the *Marrow*, illustrated by copious notes, which was published in 1726, and has ever since been well-known to the religious public. The Assembly, ashamed, after all, of the act complained of, remodelled it in such a way as to abate somewhat its grossness, though, in the process, it lost little of its venom.

Following out his plan of illustrating gospel truth, Boston preached to his people a course of sermons on the covenants of works and of grace, which have long been in the hands of the public, and duly prized by judicious readers. His last appearance in the General Assembly was in the year 1729, in the case of Professor Simson, where he dissented from the sentence of the Assembly as being no just testimony of the church's indignation against the dishonour done by the said Mr. Simson to our glorious Redeemer, the great God and our Saviour, nor agreeable to the rule of God's word in such cases, nor a fit means to bring the said Mr. Simson himself to repentance, of which, he added, he had yet given no evidence. This dissent, however, for the sake of the peace of the church, which some said it might endanger, he did not insist to have recorded on the Assembly's books. His last public work was a letter to the presbytery, which met at Selkirk, May 2, 1732, respecting the overture for settling vacant parishes;

which breathes all the ardour and piety of his more early productions, and in which he deprecates the turning of that overture into a standing law, as what cannot fail to be the ruin of the church, and he prays that his letter may be recorded as a testimony against it. His health had been for a number of years declining; he was now greatly emaciated; and he died on the twentieth of May, 1732, in the fifty-sixth year of his age. Mr. Boston was married shortly after his settlement at Simprin to Katharine Brown, a worthy pious woman, by whom he had ten children, four of whom only survived him. Thomas, the youngest, was ordained to the pastoral care of the parish of Oxnam; but removing thence to Jedburgh without a presentation from the patron, or the leave of his presbytery, became one of the fathers of the Relief church. Of the fortunes of his other children we have not been informed. Of the character of Boston there can be but one opinion. Ardent and pious, his whole life was devoted to the promoting of the glory of God and the best interests of his fellowmen. As an author, though he has been lowered by the publication of too many posthumous works, he must yet be admitted to stand in the first class. Even the most incorrect of his pieces betray the marks of a highly original and powerful mind, and his *Fourfold State of Man* cannot fail to be read and admired so long as the faith of the gospel continues to be taught and learned in the language in which it is written.

BOSWELL, JAMES, the friend and biographer of Dr. Samuel Johnson, was born at Edinburgh, October 29, 1740.

The Boswells or Bosvilles, are supposed to have "come in with the Conqueror," and to have migrated to Scotland in the reign of David I. [1124-53]. David Boswell of Balmuto, the eleventh representative of the family in succession, had, besides his heir, Alexander, who succeeded to the family estates, a son named Thomas, who became a servant of James IV., and was gifted by that monarch with the lands of Auchinleck, in Ayrshire, which were then in the crown by recognition.

James Boswell was the eldest son of Alexander Boswell of Auchinleck, and of Enphemia Erskine. The father was an advocate, in good practice at the Scottish bar; who was, in 1754, elevated to the bench, taking, on that occasion, the designation of Lord Auchinleck. James Boswell, father of Lord Auchinleck, had also been a Scottish barrister, and, as we learn from Lord Kames, one of the best of his time; his wife was a daughter of Alexander Bruce, second Earl of Kincardine, whose mother was Veronica, a daughter of the noble house of Somerseldyke in Holland. For an account of Auchinleck, reference may be made to *Johnson's Journey to the Western Islands*.

The father of the biographer was a stern and rigid Presbyterian, and a zealous supporter of the House of Hanover: young Boswell, on the contrary, from his earliest years, showed a disposition favourable to the high church and the family of Stuart. Dr. Johnson used to tell the following story of his biographer's early years, which Boswell has confessed to be literally true. "In 1745 Boswell was a fine boy, wore a white cockade, and prayed for King James, till one of his uncles (General Cochran) gave him a shilling, on condition that he would pray for King George, which he accordingly did." "So you see," adds Boswell, who has himself preserved the anecdote, "*Whigs of all ages are made in the same way.*"

He received the rudiments of his education at the

school of Mr. James Mundell, in Edinburgh, a teacher of considerable reputation, who gave elemental instruction to many distinguished men. He afterwards went through a complete academical course at the college of Edinburgh, where he formed an intimacy with Mr. Temple of Allardeen in Northumberland, afterwards vicar of St. Gluivies in Cornwall, and known in literary history for a well-written character of Gray, which has been adopted both by Dr. Johnson and Mason in their memoirs of that poet. Mr. Temple and several other young English gentlemen were fellow-students of Boswell, and it is supposed that his intercourse with them was the original and principal cause of that remarkable predilection for English society and manners which characterized him through life.

Boswell very early began to show a taste for literary composition, in which he was encouraged by Lord Somerville, of whose flattering kindness he ever preserved a grateful recollection. His lively and sociable disposition, and passion for distinguishing himself as a young man of parts and vivacity, also led him, at a very early period of life, into the society of the actors in the theatre. While still at college, Lady Houston, sister of Lord Cathcart, put under his care a comedy, entitled *The Coquettes, or the Gallant in the Closet*, with a strict injunction that its author should be concealed. Boswell exerted his interest among the players to get this piece brought out upon the stage, and made himself further conspicuous by writing the prologue, which was spoken by Mr. Parsons. It was condemned at the third performance, and not unjustly, for it was found to be chiefly a bad translation of one of the worst plays of Corneille. Such, however, was the fidelity of Boswell, that, though universally believed to be the author, and consequently laughed at in the most unmerciful manner, he never divulged the name of the fair writer, nor was it known till she made the discovery herself.

After studying civil law for some time at Edinburgh, Boswell went for one winter to pursue the same study at Glasgow, where he, at the same time, attended the lectures of Dr. Adam Smith on moral philosophy and rhetoric. Here he continued, as at Edinburgh, to adopt his companions chiefly from the class of English students attending the university.

Inspired, by reading and conversation, with an almost enthusiastic notion of London life, Boswell paid his first visit to that metropolis in 1760, and his ardent expectations were not disappointed. The society, amusements, and general style of life which he found in the modern Babylon, and to which he was introduced by the poet Derrick, were suited exactly to his taste and temper. He had already given some specimens of a talent for writing occasional essays and poetical *jeux d'esprit*, in periodical works, and he therefore appeared before the wits of the metropolis as entitled to some degree of attention. He was chiefly indebted, however, for their friendship, to Alexander, Earl of Eglintoune, one of the most amiable and accomplished noblemen of his time, who, being of the same county, and from his earliest years acquainted with the family of Auchinleck, insisted that young Boswell should have an apartment in his house, and introduced him, as Boswell himself used to say, "into the circle of the great, the gay, and the ingenious." Lord Eglintoune carried his young friend along with him to Newmarket; an adventure which seems to have made a strong impression on Boswell's imagination, as he celebrated it in a poem called *The Cub at Newmarket*, which was published by Dodsley, in 1762,

THE RIGHT HONOURABLE
SIR ROBERT WALPOLE

Engraved by J. Kneller

in 4to. The *cut* was himself, as appears from the following extract:—

"Lord Eglington, who loves, you know,
A little dash of whim or so,
By chance a curious *cut* had got,
On Scotia's mountains newly caught."

In such terms was Boswell content to speak of himself in print, even at this early period of life, and what adds to the absurdity of the whole affair, he could not rest till he had read *The Cut at Newmarket* in manuscript to Edward, Duke of York, and obtained permission from his royal highness to dedicate it to him.

It was the wish of Lord Auchinleck that his son should apply himself to the law, a profession to which two generations of the family had now been devoted, and in which Lord Auchinleck thought that his own eminent situation would be of advantage to the success of a third. Boswell himself, though, in obedience to his father's desire, he had studied civil law at the colleges of Edinburgh and Glasgow, was exceedingly unwilling to consign himself to the studious life of a barrister at Edinburgh, where at this time the general tone of society was the very reverse of his own temperament. He had already cast his eyes upon the situation of an officer in the foot-guards, as calculated to afford him that indulgence in London society which he so much desired, while it was, at the same time, not incompatible with his prospects as a Scottish country gentleman, and it was with some difficulty that his father prevailed upon him to return to Scotland and consult about the choice of a profession. The old judge even took the trouble to put his son through a regular course of instruction in the law, in the hope of inspiring him with an attachment to it. But though he was brought the length of standing his trials as a civilian before a committee of the faculty, he could not be prevailed upon to enter heartily into his father's views.

During part of the years 1761 and 1762, while confined to Edinburgh and to this partial and unwilling study of the law, he contrived to alleviate the irksomeness of his situation by cultivating the society of the illustrious men who now cast a kind of glory over Scotland and Scotsmen. Kames, Blair, Robertson, Hume, and Dalrymple, though greatly his seniors, were pleased to honour him with their friendship; more, perhaps, on account of his worthy and dignified parent than on his own. He also amused himself at this time in contributing *jeux d'esprit* to *A Collection of Original Poems by Scottish Gentlemen*, of which two volumes were successively published by Alexander Donaldson, an enterprising bookseller; being an imitation of the *Miscellanies* of Dodsley.

At this time he cultivated a particular intimacy with the Hon. Andrew Erskine, a younger brother of the musical Earl of Kelly, and who might be said to possess wit by inheritance, his father being remarkable for this property (though not for good sense), while his mother was the daughter of Dr. Pitcairne. Erskine and Boswell were, in frivolity, *Arcades ambo*; or rather there seemed to be a competition betwixt them which should exhibit the greater share of that quality. A correspondence, in which this contest seems to be carried on, was published in 1763, and, as there was no attempt to conceal names, the two letter-writers must have been regarded, in that dull and decorous age, as little better than fools—fools for writing in such a strain at all, but doubly fools for laying their folly in such a permanent shape before the world.

At the end of the year 1762, Boswell, still retaining his wish to enter the guards, repaired once more

to London to endeavour to obtain a commission. For this purpose he carried recommendations to Charles, Duke of Queensberry—the amiable patron of Gay—who, he believed, was able to obtain for him what he wished. Owing, however (as is understood), to the backwardness of Lord Auchinleck to enforce his claims, his patrons put him off from time to time, till he was again obliged to return to Scotland. At length, in the spring of 1763, a compromise was made between the father and his son—the latter agreeing to relinquish his favourite project, and resume the study of the civil law for one winter at Utrecht, with the view of ultimately entering the legal profession, on the condition that, after the completion of his studies he should be permitted to make what was then called "the grand tour." Boswell set out for this purpose early in 1763; and, according to the recollection of an ancient inhabitant of Glasgow, his appearance in riding through that city on his way from Auchinleck was as follows:—"A cocked hat, a brown wig, brown coat, made in the court fashion, red vest, corduroy small clothes, and long military-looking boots. He was on horseback, with his servant at a most aristocratic distance behind, and presented a fine specimen of the Scottish country gentleman of that day."—*Edin. Lit. Jour.* ii. 327.

In Boswell's previous visits to London he had never had the good fortune to make the acquaintance of Dr. Samuel Johnson. He had now that pleasure. On the 16th of May, as he himself takes care to inform us, while sitting in the backshop of Thomas Davies, the bookseller, No. 8 Russell Street, Covent Garden, Johnson came in, and Boswell was introduced by Davies as a young gentleman "from Scotland." Owing to the antipathy of the lexicographer to that country, his conversation with Boswell was not at first so cordial a description as at all to predicate the remarkable friendship they afterwards formed. Boswell, however, by the vivacity of his conversation, soon beguiled the Doctor of his prejudices; and their intimacy was confirmed by a visit which he soon after paid to Johnson at his apartments in the Temple. During the few months which Boswell spent in town before setting out for Utrecht, he applied himself assiduously to cultivate this friendship, taking apartments in the Temple in order that he might be the oftener in the company of the great man. Even at this early period he began that practice of noting down the conversation of Johnson, which eventually enabled him to compose such a splendid monument to their common memory.

He set out for Utrecht in August, 1763, and, after studying for the winter under the celebrated civilian Trotz, proceeded, according to the compact with his father, upon the tour of Europe. In company with the Earl Marischal, whose acquaintance he had formed, he travelled through Switzerland and Germany, visiting Voltaire at Ferney, and Rousseau in the wilds of Neuchâtel—men whom his regard for the principles of religion might have taught him to avoid, if his itch for the acquaintance of noted men—one of the most remarkable features of his character—had not forced him into their presence. He afterwards crossed the Alps, and spent some time in visiting the principal cities in Italy. Here he formed an acquaintance with Lord Mountstuart, the eldest son of the Earl of Bute, to whom he afterwards dedicated his law thesis on being admitted to the bar.

At this time the inhabitants of the small island of Corsica were engaged in their famous struggle for liberty against the Genoese; and Pasquale de Paoli, their heroic leader, was, for the time, one of the most noted men in Europe. Boswell, struck by an irre-

pressible curiosity regarding this person, sailed to Corsica in autumn, 1765, and introduced himself to Paoli at his palace by means of a letter from Rousseau. He was received with much distinction and kindness, and noted down a good deal of the very striking conversation of the Corsican chief. After a residence of some weeks in the island, during which he made himself acquainted with all its natural and moral features, he returned through France, and arrived in London, February, 1766, his journey being hastened by intelligence of the death of his mother. Dr. Johnson received him, as he passed through London, with renewed kindness and friendship.

Boswell now returned to Scotland, and, agreeably to the treaty formed with Lord Auchinleck, entered (July 26, 1766) as a member of the faculty of advocates. His temper, however, was still too volatile for the studious pursuit of the law, and he did not make that progress in his profession which might have been expected from the numerous advantages with which he commenced. The Douglas cause was at this time pending, and Boswell, who was a warm partisan of the young claimant, published (November, 1767) a pamphlet entitled *The Essence of the Douglas Cause*, in answer to one entitled *Considerations on the Douglas Cause*, in which a strenuous effort had been made to prove the claimant an impostor. It is said that Mr. Boswell's exertions on this occasion were of material service in exciting a popular prepossession in favour of the doubtful heir. This, however, was the most remarkable appearance made by Mr. Boswell as a lawyer, if it can be called so.

His Corsican tour and the friendship of Paoli had made a deep impression on Boswell's mind. He conceived that he had seen and made himself acquainted with what had been seen and known by few; and he was perpetually talking of the islanders and their chief. This mania, which was rather perhaps to be attributed to his vain desire of showing himself off in connection with a subject of popular talk than any appreciation of the noble character of the Corsican struggle, at length obtained him the nickname of *Paoli*, or *Paoli-Boswell*. Resolving that the world at large should participate in what he knew of Corsica, he published, in the spring of 1768, his account of that island, which was printed in 8vo by the celebrated brothers Foulis at Glasgow, and was well received. The sketches of the island and its inhabitants are lively and amusing; and his memoir of Paoli, which follows the account of the island, is a spirited narrative of patriotic deeds and sufferings. The work was translated into the German, Dutch, French, and Italian languages, and everywhere infected its readers with its own enthusiastic feeling in behalf of the oppressed islanders. Dr. Johnson thus expressed himself regarding it:—"Your journal is curious and delightful; I know not whether I could name any narrative by which curiosity is better excited or better gratified." On the other hand, Johnson joined the rest of the world in thinking that the author indulged too much personally in his enthusiasm upon the subject, and advised him, in a letter dated March 23, 1768, to "empty his head of Corsica." Boswell was so vain of his book as to pay a visit to London in the spring court vacation, chiefly for the purpose of seeking Dr. Johnson's approbation more at large.

In the following winter a patent was obtained, for the first time, by Ross, the manager of the Edinburgh theatre; but, nevertheless, a violent opposition was still maintained against this public amusement by the more rigid portion of the citizens. Ross, being anxious to appease his enemies, solicited Boswell to write a prologue for the opening of the house,

which request was readily complied with. The verses were, as Lord Mansfield characterized them, witty and conciliating; and their effect, being aided by friends properly placed in different parts of the house, was instantaneous and most triumphant; the tide of opposition was turned, the loudest plaudits were given, and Ross at once entered upon a very prosperous career.

In 1769 Boswell paid a visit to Ireland, where he spent six or seven weeks, chiefly at Dublin, and enjoyed the society of Lord Charlemont, Dr. Leland, Mr. Flood, Dr. Macbride, and other eminent persons of that kingdom, not forgetting the celebrated George Falconer, the friend of Swift and Chesterfield. Viscount, afterwards Marquis Townshend, was then lord-lieutenant, and the congeniality of their dispositions united them in the closest friendship. He enjoyed a great advantage in the union of one of his female cousins to Mr. Sibthorpe, of the county of Down, a gentleman of high influence, who was the means of introducing him into much good society. Another female cousin, Miss Margaret Montgomery, daughter of Mr. Montgomery of Lainslaw, accompanied him on the expedition, and not only added to his satisfaction by her own delightful company, but caused him to be received with much kindness by her numerous and respectable relations. This jaunt was the means of converting Boswell from a resolution which he appears to have formed to live a single life. He experienced so much pleasure from the conversation of Miss Montgomery, that he was tempted to seek her society for life in a matrimonial engagement. He had resolved, he said, never to marry—had always protested, at least, that a large fortune would be indispensable. He was now, however, impressed with so high an opinion of her particular merit, that he would waive that consideration altogether, provided she would waive his faults also, and accept him for better for worse. Miss Montgomery, who was really an eligible match, being related to the noble family of Eglintoun, while her father laid claim to the dormant peerage of Lyle, acceded to his proposal with corresponding frankness; and it was determined that they should be married at the end of the year, after he should have paid one parting visit to London.

Before this visit was paid, Mr. Boswell was gratified in the highest degree by the arrival of General Paoli, who, having been forced to abandon his native island, in consequence of the French invasion, had sought that refuge on the shores of Britain which has never yet been refused to the unfortunate of any country. In autumn, 1769, General Paoli visited Scotland and Boswell; an account of his progress through the country, with Boswell in his train, is given in the *Scots Magazine* of the time. Both on this occasion and on his subsequent visit to London, Boswell attended the exiled patriot with an obsequious fidelity, arising no doubt as much from his desire of appearing in the company of a noted character, as from gratitude for former favours of a similar kind. Among other persons to whom he introduced his Corsican friend, was Dr. Johnson, an entirely opposite being in destiny and character, but who, nevertheless, was at some pains to converse with the unfortunate stranger—Boswell acting as interpreter. It would be curious to know in what light Paoli, who was a high-minded man, beheld his eccentric *cicerone*.

During the time of his visit to London, September, 1769, the jubilee took place at Stratford, to celebrate the birth of Shakspeare. As nearly all the literary, and many of the fashionable persons of the day were collected at this solemnity, Boswell entered

into it with a great deal of spirit, and played, it is said, many fantastic tricks, more suited to a carnival scene on the Continent, than to a sober festival in England. To pursue a contemporary account, "One of the most remarkable masks upon this occasion was James Boswell, Esq., in the dress of an armed Corsican chief. He entered the amphitheatre about 12 o'clock. He wore a short, dark-coloured coat of coarse cloth, scarlet waistcoat and breeches, and black spatterdash; his cap or bonnet was of black cloth; on the front of it was embroidered in gold letters, *Viva la liberta*; and on one side of it was a handsome blue feather and cockade, so that it had an elegant as well as a warlike appearance. On the breast of his coat was sewed a Moor's head, the crest of Corsica, surrounded with branches of laurel. He had also a cartridge-pouch, into which was stuck a stiletto, and on his left side a pistol was hung upon the belt of his cartridge-pouch. He had a fusc slung across his shoulder, *wore no powder in his hair!* but had it plaited at full length, with a knot of blue ribbons at the end of it. He had, by way of staff, a very curious vine all of one piece, with a bird finely carved upon it, emblematical of the sweet bard of Avon. He wore no mask; saying, that it was not proper for a gallant Corsican. So soon as he came into the room, he drew universal attention. The novelty of the Corsican dress, its becoming appearance, and the character of that brave nation, concurred to distinguish the armed Corsican chief. He was first accosted by Mrs. Garrick, with whom he had a good deal of conversation. Mr. Boswell danced both a minuet and a country-dance with a very pretty Irish lady, Mrs. Sheldon, wife to Captain Sheldon of the 38th regiment of foot, who was dressed in a genteel domino, and before she danced, threw off her mask." *London Magazine, September, 1769*, where there is a portrait of the modern Xenophon in this strange guise.

On the 25th of November he was married at Lainsaw, in Ayrshire, to Miss Montgomery, and what is rather a remarkable circumstance, his father was married on the same day, at Edinburgh, to a second wife. With admirable sense, affection, and generosity of heart, the wife of James Boswell possessed no common share of wit and pleasantry. She died in June, 1789, leaving two sons, Alexander and James, and three daughters, Veronica, Euphemia, and Elizabeth. For two or three years after his marriage Boswell appears to have lived a quiet professional life at Edinburgh, paying only short occasional visits to London. In autumn, 1773, Dr. Johnson gratified him by coming to Edinburgh, and proceeding in his company on a tour through the north of Scotland and the Western Islands. On this occasion Boswell kept a journal, as usual, of every remarkable part of Dr. Johnson's conversation. The journey being made rather late in the season, the two travellers encountered some hardships, and a few dangers; but they were highly pleased with what they saw, and the reception they everywhere met with; Boswell, for his own part, declaring that he would not have missed the acquisition of so many new and delightful ideas as he had gained by this means for five hundred pounds. Dr. Johnson published an account of their trip, and the observations he made during its progress, under the title of a *Journey to the Western Islands*; and Boswell, after the death of his friend (1785), gave to the world the journal he had kept, as a *Tour to the Hebrides*, 1 volume 8vo. The latter is perhaps one of the most entertaining works in the language, though only rendered so, we must acknowledge, at the expense of the author's dignity. It ran through three edi-

tions during the first twelvemonth, and has since been occasionally reprinted.

For many years after the journey to the Hebrides, Boswell only enjoyed such snatches of Johnson's company and conversation as he could obtain by occasional visits to London, during the vacations of the Court of Session. Of these interviews, however, he has preserved such ample and interesting records, as must make us regret that he did not live entirely in London. It appears that, during the whole period of his acquaintance with Johnson, he paid only a dozen visits to London, and spent with him only a hundred and eighty days in all; which, added to the time they spent in their northern journey between August 18th and November 23d, 1773, makes the whole period during which the biographer enjoyed any intercourse with his subject, only two hundred and seventy-six days, or one hundredth part of Johnson's life.

The strangely vain and eccentric conduct of Boswell had, long ere this period, rendered him almost as notable a character as any of those whom he was so anxious to see. His social and good-humoured character gained him universal friendship; but this friendship was never attended with perfect respect. Men of inferior qualifications despised the want of natural dignity which made him go about in attendance upon every great man, and from no higher object in life than that of being the commemorator of their conversations. It is lamentable to state that, among those who despised him, was his own father; and even other relations, from whom respect might have been more imperatively required, were fretted by his odd habits. "Old Lord Auchinleck," says Sir Walter Scott, "was an able lawyer, a good scholar, after the manner of Scotland, and highly valued his own advantages as a man of good estate and ancient family, and, moreover, he was a strict Presbyterian and Whig of the old Scottish cast." To this character his son presented a perfect contrast—a light-headed lawyer, an aristocrat only in theory, an Episcopalian, and a Tory. But it was chiefly with the unsettled and undignified conduct of his son that the old gentleman found fault. "There's nae hope for Jamie, man," he said to a friend about the time of the journey to the Hebrides; "Jamie's gane clean gyte: What do ye think, man? he's aff wi' the land-louping scoundrel of a Corsican; and whase tail do ye think he has pinned himself to now, man?" Here the old judge summoned up a sneer of most sovereign contempt. "A *dominie*, man (meaning Johnson), an auld *dominie*, that keepit a schule, and ca'd it an academy!" By the death of Lord Auchinleck, in 1782, Boswell was at length freed from what he had always felt to be a most painful restraint, and at the same time became possessed of his paternal estate.

Boswell's mode of life, his social indulgences, and his frequent desertion of business for the sake of London literary society, tended greatly to embarrass his circumstances; and he was induced to try if they could be repaired by exertions in the world of politics. In 1784, when the people were in a state of most alarming excitement in consequence of Mr. Fox's India Bill, and the elevation of Mr. Pitt, he wrote a pamphlet, entitled *A Letter to the People of Scotland, on the Present State of the Nation*; and endeavoured, by means of it, to obtain the favourable notice of Mr. Pitt; but we are informed that, though the youthful minister honoured the work with his approbation, the efforts of the author to procure an introduction to political life were attended with a mortifying want of success. He was, nevertheless, induced to appear once more as a pamphleteer in

1785, when he published a second *Letter to the People of Scotland*, though upon an humbler theme, namely, "On the alarming attempt to infringe the articles of union, and introducing a most pernicious innovation, by diminishing the numbers of the lords of session." This proposal had been brought forward in the House of Commons; the salaries of the judges were to be raised, and, that the expense might not fall upon the country, their number was to be reduced to ten. Boswell (to use a modern phrase) immediately commenced a vehement agitation in Scotland, to oppose the bill; and among other measures which he took for exciting public attention, published this letter. His chief argument was, that the number of the judges was established immutably by the act of union; an act which entered into the very constitution of parliament itself, and how then could parliament touch it? The agitation prevailed, and the court remained as it had been, for another generation.

Boswell, whose practice at the Scottish bar was never very great, had long wished to remove to the English, in order that he might live entirely in London. His father's reluctance, however, had hitherto prevented him. Now that the old gentleman was dead, he found it possible to follow his inclination, and accordingly he began, from time to time, to keep his terms at the Inner Temple. At Hilary term, 1786, he was called to the English bar, and in the ensuing winter removed his family to London. His first professional effort is said to have been of a somewhat ominous character. A few of the idlers of Westminster Hall, conspiring to quiz poor *Boswy*, as he was familiarly called, made up an imaginary case, full of all kinds of absurdities, which they caused to be presented to him for his opinion. He, taking all for real, returned a *bona-fide* note of judgment, which, while it almost killed his friends with laughter, covered himself with ineffaceable ridicule.

It is to be regretted that this decisive step in life was not adopted by Boswell at an earlier period, as thereby he might have rendered his *Life of Johnson* still more valuable than it is. Johnson having died upwards of a year before his removal, it was a step of little importance in a literary point of view; nor did it turn out much better in respect of professional profit.

So early as 1781, when Mr. Burke was in power, that great man had endeavoured to procure an extension of the government patronage towards Boswell. "We must do something for you," he said, "for our own sakes," and recommended him to General Conway for a vacant place, by a letter in which his character was drawn in glowing colours. The place was not obtained; but Boswell declared that he valued the letter more. He was now enabled, by the interest of Lord Lowther, to obtain the situation of recorder of Carlisle. Finding this recordership, at so great a distance from London, attended with many inconveniences, Boswell, after holding it for about two years, resigned it.

It was well known at this time that he was very anxious to get into parliament; and many wondered that so sound a Tory should not have obtained a seat at the hands of some great parliamentary proprietor. Perhaps this wonder may be explained by a passage in his last *Letter to the People of Scotland*. "Though ambitious," he says, "I am uncorrupted; and I envy not high situations which are attained by the want of public virtue in men born without it, or by the prostitution of public virtue in men born with it. Though power, and wealth, and magnificence, may at first dazzle, and are, I think, most desirable, no

wise man will, upon sober reflection, envy a situation which he feels he could not enjoy. My friend—my 'Mæcenas atavis edite regibus'—Lord Mountstuart flattered me once very highly without intending it. 'I would do anything for you,' he said, 'but bring you into parliament, for I could not be sure but you would oppose me in something the very next day.' His lordship judged well. Though I should consider, with much attention, the opinion of such a friend before taking my resolution, most certainly I should oppose him in any measure which I was satisfied ought to be opposed. I cannot exist with pleasure, if I have not an honest independence of mind and of conduct; for, though no man loves good eating and drinking better than I do, I prefer the broiled blade-bone of mutton and humble port of 'downright Shippen,' to all the luxury of all the statesmen who play the political game all through."

He offered himself, however, as a candidate for Ayrshire, at the general election of 1790; but was defeated by the interest of the minister, which was exerted for a more pliant partisan. On this and all other proper occasions, he made no scruple to avow himself a Tory and a royalist; saying, however, in the words of his pamphlet just quoted, "I can drink, I can laugh, I can converse, in perfect good humour, with Whigs, with Republicans, with Dissenters, with Moravians, with Jews—they can do me no harm—my mind is made up—my principles are fixed—but I would vote with Tories, and pray with a dean and chapter."

If his success at the bar and in the political world was not very splendid, he consoled himself, so far as his own fancy was to be consoled, by the grateful task of preparing for the press his *magnum opus*—the life of Dr. Johnson. This work appeared in 1791, in two volumes quarto, and was received with an avidity suitable to its entertaining and valuable character. Besides a most minute narrative of the literary and domestic life of Johnson, it contained notes of all the remarkable expressions which the sage had ever uttered in Mr. Boswell's presence, besides some similar records from other hands, and an immense store of original letters. As decidedly the most faithful biographical portraiture in existence, and referring to one of the most illustrious names in literature, it is unquestionably the first book of its class; and not only so, but there is no other biographical work at all approaching to it in merit. While this is the praise deserved by the work, it happens, rather uncommonly, that no similar degree of approbation can be extended to the writer. Though a *great work*, it is only so by accident, or rather through the persevering assiduity of the author in a course which no man fit to produce a designedly great work could have submitted to. It is only great by a multiplication and agglomeration of little efforts. The preparation of a second edition of the life of Dr. Johnson was the last literary performance of Boswell, who died, May 19, 1795, at his house in Great Poland Street, London, in the 55th year of his age; having been previously ill for five weeks of a disorder which had commenced as an intermitting fever. He was buried at the family seat of Auchinleck.

The character of Boswell is so amply shadowed forth by the foregoing account of his life, that little more need be said about it. That he was a good-natured social man, possessed of considerable powers of imagination and humour, and well acquainted with literature and the world of common life, is universally acknowledged. He has been, at the same time, subjected to just ridicule for his total want of that natural dignity by which men of the world

secure and maintain the respect of their fellow-creatures in the daily business of life. He wanted this to such a degree, that even those relations whose respect was most necessary, according to the laws of nature, could scarcely extend it; and from the same cause his intellectual exertions, instead of shedding a lustre upon his name, have proved rather a kind of blot in his pedigree. His unmanly obsequiousness to great men—even though some of these were great only by the respect due to talent—his simpleton drollery—his degrading employment as a chronicler of private conversations—his mean tastes, among which was the disgusting one of a fondness for seeing executions—and the half folly, half vanity, with which he could tell the most delicate things, personal to himself and his family, in print—have altogether conspired to give him rather notoriety than true fame, and, though perhaps leaving him affection, deprive him entirely of respect. It was a remarkable point in the character of such a man, that, with powers of entertainment almost equal to Shakspeare's description of Yorick, he was subject to grievous fits of melancholy in private. One of his works, not noticed in the preceding narrative, was a series of papers under the title of *The Hypochondriac*, which appeared in the *London Magazine* for 1782, and were intended to embody the varied feelings of a man subject to that distemper.

BOSWELL, ALEXANDER and **JAMES**, sons of the preceding. It has been remarked, as creditable to the memory of James VI., that he educated two sons, who were, both in point of personal and intellectual character, much above the standard of ordinary men. The same remark will apply to the biographer of Johnson, who, whatever may be thought of his own character, reared two sons who stood forth afterwards as a credit to his parental care. A wish to educate his children in the best manner, was one of the ruling passions of this extraordinary *litterateur* in his latter years. He placed both his sons at Westminster School, and afterwards in the university of Oxford, at an expense which appears to have been not altogether justified by his own circumstances.

ALEXANDER BOSWELL, who was born October 9, 1775, succeeded his father in the possession of the family estate. He was distinguished as a spirited and amiable country gentleman, and also as a literary antiquary of no inconsiderable erudition. Perhaps his taste, in the latter capacity, was greatly fostered by the possession of an excellent collection of old manuscripts and books, which was gathered together by his ancestors, and has acquired the well-known title of the "AUCHINLECK LIBRARY." From the stores of this collection, in 1804, Sir Walter Scott published the romance of *Sir Tristram*, which is judged by its learned editor to be the earliest specimen of poetry by a Scottish writer now in existence. Besides this invaluable present to the literary world, the Auchinleck Library furnished, in 1812, the black letter original of a disputation held between John Knox and Quentin Kennedy at Maybole in 1562, which was printed at the time by Knox himself, but had latterly become so scarce that hardly another copy, besides that in the Auchinleck Library, was known to exist. Mr. Boswell was at the expense of printing a fac-simile edition of this curiosity, which was accepted by the learned as a very valuable contribution to our stock of historical literature.

The taste of Alexander Boswell was of a much manlier and more sterling character than that of his father; and instead of being alternately the active and passive cause of amusement to his friends, he

shone exclusively in the former capacity. He possessed, indeed, a great fund of volatile talent, and, in particular, a most pungent vein of satire, which, while it occasionally inspired fear and dislike in those who were liable to become its objects, produced no admiration which was not also accompanied by respect. At an early period of his life, some of his poetical *jeux d'esprit* occasionally made a slight turmoil in that circle of Scottish society in which he moved. He sometimes also exercised his pen in that kind of familiar vernacular poetry which Burns again brought into fashion; and in the department of song-writing he certainly met with considerable success. A small volume, entitled, *Songs chiefly in the Scottish Dialect*, was published by him, anonymously, in 1803, with the motto, "Nulla venenato litera mixta joco," a motto which it would have been well for him if he had never forgot. In a brief note on the second folio of this little work, he mentioned that he was induced to lay these trivial compositions in an authentic shape before the public, because corrupted copies had previously made their appearance. The truth is, some of his songs had already acquired a wide acceptance in public life, and were almost as familiar as those of Burns.¹ The volume also contains some English compositions, which still retain a popularity—such as "Taste Life's Glad Moments," which, he tells us, he translated at Leipzig, in 1795, from the German song, "Freu't euch des Lebens." Mr. Boswell also appears, from various compositions in this little volume, to have had a turn for writing popular Irish songs. One or two of his attempts in that style are replete with the grotesque character of the nation.²

In 1810 Mr. Boswell published a small volume under the title, *Edinburgh, or the Ancient Royalty, a Sketch of former Manners, by Simon Gray*. It is a kind of city eclogue, in which a farmer, who knew the town in a past age, is supposed to converse regarding its modern changes, with a city friend. It contains some highly curious memorials of the simple manners which obtained in Edinburgh, before

¹ We may instance, "Auld Gudeman, ye're a Drucken Carle," "Jenny's Bawbee," and "Jenny Dang the Weaver."

² It is hardly worth while to say more of a few fugitive lyrics; but yet we cannot help pointing out a remarkably beautiful antithesis, in one styled "The Old Chieftain to his Sons:—"

"The auld will speak, the young maun hear,
Be canny, but be guile and leal;
Yur ain ill's aye hae heart to bear,
Anither's aye hae heart to feel."

In another he thus ludicrously adverts, in a fictitious character, to the changes which modern manners, rather than time, have produced upon the external and internal economy of the Scottish capital:—

Hech! what a change hae we now in this town!

A' now are braw lads, the lasses a' glancin';
Folk maun be dizzy gaun aye in this rout!

For deil a hae't's done now but feastin' and dancin'.
Gowd's no that scanty in ilk siller pock,

Whan lika bit laddie maun hae his bit staigie;

But I kent the day when there was na a Jock,

But trotted about upon honest shanks-raige,

Little was stown then, and less gaed to waste,

Earely a mullin for muce or for rattens;

The thrify gudewife to the flesh-market paced,

Her equipage a'—just a guide pair o' pattens.

Folk were as gude then, and friends were as leal;

Though coaches were scant, wi' their cattle a' cantrin';

Right are we were tell't by the housemaid or chiel,

'Sir, an' ye please, here's yer lass and a lantern.'

The town may be cloutin and pieced till it meets,

A' neebours benorth and besouth without halitn';

Brigs may be biggit over lums and ower streets,

The Nor-Loch itsel' heaped as heigh as the Calton.

But whar is true friendship, and whar will you see

A' that is guile, honest, modest, and thrify?

Tak' gray hairs and wrinkles, and hirie wi' me,

And think on the seventeen-hundred and fifty.

the change described in the song just quoted. At a subsequent period, Mr. Boswell established a private printing-press at Auchinleck, from which he issued various trifles in prose and verse, some of which are characterized by much humour. In 1816 appeared a poetical tale, somewhat like Burns' *Tam o' Shanter*, entitled, *Sheelton Haughs, or the Sow is Flitted!* being founded on a traditionary story regarding an Ayrshire feud of the fifteenth century.¹ In 1821 Mr. Boswell was honoured with what had been the chief object of his ambition for many years, a baronetcy of Great Britain. About this period, politics ran very high in the country, and Sir Alexander, who had inherited all the Tory spirit of his father, sided warmly with the ministry. In the beginning of the year 1821, a few gentlemen of similar prepossessions conceived it to be not only justifiable, but necessary, that the fervour of the radical press, as it was called, should be met by a corresponding fervour on the other side, so that the enemies of the government might be combated with their own weapons. Hence arose a newspaper in Edinburgh, styled the *Beacon*, to which Sir Alexander Boswell contributed a few *jeux d'esprit*, aimed at the leading men on the other side, and alleged to have far exceeded the proper line of political sarcasm. These being continued in a subsequent paper, which was published at Glasgow, under the name of the *Sentinel*, at length were traced to their author by James Stuart, Esq. younger of Dunearn, who had been the object of some of the rudest attacks, and repeatedly accused of cowardice. The consequence of this discovery was a challenge from Mr. Stuart to Sir Alexander, and the hostile parties having met near Auchtertool in Fife, March 26, 1822, the latter received a shot in the bottom of the neck, which terminated his existence next day. Mr. Stuart was tried for this offence, by the High Court of Justiciary, but most honourably acquitted. Sir Alexander left a widow and several children.

JAMES BOSWELL, the second son of the biographer of Johnson, was, as already mentioned, educated at Westminster School. He was afterwards entered of Brazen-nose College, and there had the honour to be elected fellow upon the Vinerian foundation. Mr. Boswell possessed talents of a superior order, sound classical scholarship, and a most extensive and intimate knowledge of our early literature. In the investigation of every subject he pursued, his industry, judgment, and discrimination, were equally remarkable; his memory was unusually tenacious and accurate; and he was always as ready as he was competent, to communicate his stores of information

for the benefit of others. Mr. Malone was influenced by these qualifications, added to the friendship which he entertained for Mr. Boswell, to select him as his literary executor; and to his care this eminent commentator intrusted the publication of an enlarged and amended edition of *Shakspeare*, which he had long been meditating. As Mr. Malone's papers were left in a state scarcely intelligible, it is believed that no man but one of kindred genius, like Mr. Boswell, could have rendered them at all available. This, however, Mr. Boswell did in the most efficient manner; farther enriching the work with many excellent notes of his own, besides collating the text with all the earlier editions. This work, indeed, which extends to twenty-one volumes, 8vo, must be considered as not only the most elaborate edition of *Shakspeare*, but perhaps the greatest edition of any work in the English language. In the first volume, Mr. Boswell has stepped forward to defend the literary reputation of Mr. Malone against the severe attacks made by a writer of distinguished eminence, upon many of his critical opinions and statements; a task of great delicacy, and which Mr. Boswell performed in so spirited and gentlemanly a manner, that his preface may be fairly quoted as a model of controversial writing. In the same volume are inserted "Memoirs of Mr. Malone," originally printed by Mr. Boswell for private circulation; and a valuable essay on the metre and phraseology of *Shakspeare*, the materials for which were partly collected by Mr. Malone, but which was entirely indebted to Mr. Boswell for arrangement and completion.

Mr. Boswell inherited from his father a keen relish of the society of the metropolis, and accordingly he spent his life almost exclusively in the Middle Temple. Few men were better fitted to appreciate and contribute to the pleasures of social intercourse; his conversational powers, and the un-failing cheerfulness of his disposition, rendered him everywhere an acceptable guest; but it was the goodness of his heart, that warmth of friendship which knew no bounds when a call was made upon his services, which formed the sterling excellence, and the brightest feature of Mr. Boswell's character. This amiable man and excellent scholar died, February 24, 1822, in the forty-third year of his age, and was buried in the Temple church, by a numerous train of sorrowing friends. It is a melancholy circumstance that his brother, Sir Alexander, had just returned from performing the last offices to a beloved brother, when he himself was summoned from existence in the manner above related.

BOWER, ARCHIBALD, a learned person, but of dubious fame, was born on the 17th of January, 1686, near Dundee. He was a younger son of a respectable Catholic family, which, for several centuries, had possessed an estate in Forfarshire. In 1702 he was sent to the Scots College at Douay, where he studied for the church. At the end of the year 1706, having completed his first year of philosophy, he went to Rome, and there, December 9, was admitted into the order of Jesus. After his novitiate, he taught classical literature and philosophy, for two years, at Fano, and subsequently he spent three years at Fermo. In 1717 he was recalled to Rome, to study divinity in the Roman college. His last vows were made at Arezzo, in 1722.

Bower's fame as a teacher was now, according to his own account, spread over all the Italian states, and he had many invitations to reside in different places, to none of which he acceded, till the college of Macerata chose him for their professor. He was now arrived at the mature age of forty; and it was

¹ Kennedy of Bargeny tethered a sow on the lands of his feudal enemy Crawford of Kerse, and resolved that the latter gentleman, with all his vassals, should not be permitted to remove or "flit" the animal. To defeat this bravado at the very first, the adherents of Crawford assembled in great force, and entered into active fight with the Kennedys, who, with their sow, were at length driven back with great slaughter, though not till the son of the laird of Kerse, who had led his father's forces, was slain. The point of the poem lies in the dialogue which passed between the old laird and a messenger who came to apprise him of the event:—

"Is the sow flitted? tell me, loon!
Is auld Kyle up and Carrick down?
Mingled wi' sobs, his broken tale
The youth began: 'Ah, Kerse, bewail
This luckless day!—Your blythe son, John,
Ah, wa's my heart, lies on the loan—
And he could sing like ony merle!'
'Is the sow flitted?' cried the carle;
'Gie me my answer—short and plain,—
Is the sow flitted, yammerin wean?'
'The sow (deil tak her) 's over the water—
And at their backs the Crawfords batter—
The Carrick courts are rowed and bitted!'
'My thumb for Jock! THE SOW IS FLITTED!'

not to have been expected that any sudden change, either in his religious sentiments or in his moral conduct, would take place after that period of life. Probably, however, Bower had never before this time been exposed to any temptation. Being now appointed confessor to the nunnery of St. Catherine at Macerata, he is alleged to have commenced a criminal intercourse with a nun of the noble family of Buonacorsi. Alarmed, it is said, for the consequences of his imprudence, he determined upon flying from the dominions of the Pope; a step which involved the greatest danger, as he had previously become connected, in the capacity of counsellor, with the holy inquisition, which invariably punished apostasy with death. Bower's own account of his flight sets forth conscientious scruples on the score of religion, as having alone urged him to take that step; but it is hardly credible that a man in his situation could expose his life to imminent danger from a sudden access of scrupulosity. The circumstances of his flight are given in the following terms by himself:

"To execute that design with some safety, I purposed to beg leave of the inquisitor to visit the virgin at Loretto, but thirteen miles distant, and to pass a week there, but, in the meantime, to make the best of my way to the country of the Grisons, the nearest country to Macerata out of the reach of the inquisition. Having, therefore, after many conflicts with myself, asked leave to visit the neighbouring sanctuary, and obtained it, I set out on horseback the very next morning, leaving, as I purposed to keep the horse, his full value with the owner. I took the road to Loretto, but turned out of it at a small distance from Recenati, after a most violent struggle with myself, the attempt appearing to me, at that juncture, quite desperate and impracticable; and the dreadful doom reserved for me, should I miscarry, presenting itself to my mind in the strongest light. But the reflection that I had it in my power to avoid being taken alive, and a persuasion that a man in my situation might lawfully avoid it, when every other means failed him, at the expense of his life, revived my staggering resolution; and all my fears ceasing at once, I steered my course to Calvi in the dukedom of Urbino, and from thence through the Romagna into the Bolognese, keeping the by-roads, and at a good distance from the cities of Fano, Pisaro, Rimini, Forli, Faenza, and Tivola, through which the high-road passed. Thus I advanced very slowly, travelling, generally speaking, in very bad roads, and often in places where there was no road at all, to avoid, not only the cities and towns, but even the villages. In the meantime, I seldom had any other support than some coarse provisions, and a very small quantity even of them, that the poor shepherds and wood-cleavers could spare me. My horse fared not better than myself; but, in choosing my sleeping-place, I consulted his convenience as much as my own, passing the night where I found most shelter for myself, and most grass for him. In Italy there are very few solitary farm-houses or cottages, the country people there all living together in villages, and I thought it far safer to lie where I could be anyway sheltered, than to venture into any of them. Thus I spent seventeen days before I got out of the ecclesiastical state; and I very narrowly escaped being taken or murdered on the very borders of that state. It happened thus:

"I had passed two whole days without any kind of subsistence whatever, meeting nobody in the by-roads that would supply me with any, and fearing to come near any house. As I was not far from the borders of the dominions of the Pope, I thought I

should be able to hold out till I got into the Modenese, where I believed I should be in less danger than while I remained in the papal dominions; but finding myself, about noon of the third day, extremely weak and ready to faint, I came into the high road that leads from Bologna to Florence, at a few miles distance from the former city, and alighted at a post-house that stood quite by itself. Having asked the woman of the house whether she had any victuals ready, and being told that she had, I went to open the door of the only room in the house (that being a place where gentlemen only stop to change horses), and saw, to my great surprise, a placard pasted on it with a most minute description of my whole person, and the promise of a reward of 800 crowns, about £200 English money, for delivering me up alive to the inquisition, being a fugitive from the holy tribunal, and 600 crowns for my head. By the same placard, all persons were forbidden, on pain of the greater excommunication, to receive, harbour, or entertain me, to conceal or to screen me, or to be in any way aiding or assisting to me in making my escape. This greatly alarmed me, as the reader may well imagine; but I was still more affrighted when, entering the room, I saw two fellows drinking there, who, fixing their eyes upon me as soon as I came, continued looking at me very steadfastly. I strove, by wiping my face, by blowing my nose, by looking out at the window, to prevent their having a full view of me. But one of them saying, 'The gentleman seems afraid to be seen,' I put up my handkerchief, and turning to the fellow, said boldly, 'What do you mean, you rascal? Look at me, I am not afraid to be seen.' He said nothing, but, looking again steadfastly at me, and nodding his head, went out, and his companion immediately followed him. I watched them, and seeing them with two or three more in close conference, and no doubt consulting whether they should apprehend me or not, I walked that moment into the stable, mounted my horse unobserved by them, and, while they were deliberating in the orchard behind the house, rode off at full speed, and in a few hours got into the Modenese, where I refreshed, both with food and rest, as I was there in no immediate danger, my horse and myself. I was indeed surprised that those fellows did not pursue me; nor can I any other way account for it, but by supposing, what is not improbable, that, as they were strangers as well as myself, and had all the appearance of banditti or ruffians flying out of the dominions of the pope, the woman of the house did not care to trust them with her horses."

Bower now directed his course through the cantons of Switzerland, and as some of these districts were Catholic, though not under the dominion of the inquisition, he had occasionally to resume the mode of travelling above described, in order to avoid being taken. At length, May 1726, he reached the Scots College at Douay, where he threw himself upon the protection of the rector. According to his own narrative, which, however, has been contradicted in many points, he thus proved that, though he had fled from the horrors of the holy tribunal, and had begun to entertain some doubts upon several parts of the Catholic doctrines, he was not disposed to abandon entirely the profession of faith in which he had been educated. He even describes a correspondence which he entered into with the superior of his order in France, who at length recommended him to make the best of his way to England, in order that he might get fairly beyond the reach of the inquisition. This he did under such circumstances of renewed danger, that he would have been detained

at Calais, but for the kindness of an English nobleman, Lord Baltimore, who conveyed him over to Dover in his own yacht. He arrived at London in July or August, 1726.

His first friend of any eminence in England was Dr. Aspinwall, who, like himself, had formerly belonged to the order of Jesus. His conversations with this gentleman, and with the more celebrated Dr. Clarke, and Berkeley, Bishop of Cloyne, produced, or appeared to produce, such a change in his religious sentiments, that he soon after abjured the Catholic faith. For six years he continued a Protestant, but of no denomination. At length he joined the communion of the Church of England, which he professed to consider "as free in her service as any reformed church from the idolatrous practices and superstitions of Popery, and less inclined than many others to fanaticism and enthusiasm." By his friends he was recommended to Lord Aylmer, who wanted a person to assist him in reading the classics. While thus employed he conducted a review or magazine, which was started in 1730, under the title *Historia Literaria*, and was finished in eight volumes, in 1734. Being little acquainted with the English tongue, he composed the early part of this work in Italian, and had it translated by an English student; but before the work was concluded, he had made himself sufficiently acquainted with English, to dispense with his translator. After its conclusion, he was engaged by the publishers of the *Ancient Universal History*, for which work he wrote during a space of nine years, contributing, in particular, the article "Roman History." It is said that the early part of this production is drawn out to an undue length, considering that there were various other abridgments of that portion of the history of Rome; while the latter part, referring to the Eastern empire, though comparatively novel and valuable, was, from the large space already occupied, cut down into as many paragraphs as it ought to have occupied pages. The second edition of the *Universal History* was committed for revision to Mr. Bower's care, and it is said that, though he received £300 from the publishers, he performed his task, involving though it did a very large commercial interest, in the most superficial and unsatisfactory manner. His writings had been so productive before the year 1740, that he then possessed £1100 in South Sea annuities. It is alleged that he now wished to be restored to the bosom of the church, in order that he might share in its bounty as a missionary. In order to conciliate its favour, and attest his sincerity, he is said to have offered to it, through Father Shirburn, then provincial of England, the whole of his fortune on loan. The money was received on the conditions stipulated by himself, and was afterwards augmented to £1350, for which, in August, 1743, a bond was given, allowing him an annuity equal to 7 per cent. upon the principal. He is said to have been so far successful in his object that, in 1744 or 1745, he was re-admitted into, or rather reconciled to the order of Jesus—though it does not appear that he ever received the employment which he expected. In 1747, having been tempted, by a considerable offer, to write a history of the popes in a style agreeable to Protestant feeling, he is alleged to have commenced a correspondence with Father Shirburn for the purpose of getting back his money, lest, on breaking again with the church, the whole should be forfeited. He pretended that he had engaged in an illicit intercourse with a lady, to whom the money in reality belonged, and that, in order to disengage himself from a connection which lay heavily upon his conscience, he wished to refund the money. Accordingly, on the 20th of

June, 1747, he received it back. If we are to believe himself, he did not lend the money to Shirburn, but to Mr. Hill, a Jesuit, who transacted money affairs in his capacity as an attorney. He retraced it, he said, in order to be able to marry. The letters shown as having been written by him to Father Shirburn, were, he said, forgeries prepared by Catholics in order to destroy his popularity with the Protestants. But the literary world has long settled the question against Bower. The letters were published in 1756 by his countryman Dr. John Douglas, afterwards Bishop of Salisbury, along with a commentary proving their authenticity. The replies of Bower, though ingenious, are by no means satisfactory, and it is obvious that the whole transaction proves him to have been a man who little regarded principle, when he had the prospect of improving his fortune.

The first volume of his *History of the Popes* was published in 1748; and he was soon after, by the interest of Lord Lyttleton, appointed librarian to Queen Caroline. It must be remarked that this irreproachable nobleman remained the friend of Bower, while all the rest of the world turned their backs upon him; and it must be confessed, that such a fact is calculated to stagger the faith of many even in the acuteness of Bishop Douglas. On the 4th of August, 1749, when he had just turned the grand climacteric, he married a niece of Bishop Nicholson, with a fortune of £4000. In 1751 he published his second volume, and in 1753 his third, which brought down the history to the death of Pope Stephen. This work, partly from the circumstances of the author, appears to have been received with great favour by the dissenters and more devout party of the church. Bower is alleged by his enemies to have kept up the interest of the publication, by stories of the danger in which he lay from the malignity of the Catholics, who, as he gave out, attempted on one occasion, to carry him off by water from Greenwich. Lord Lyttleton, in April, 1754, appointed him clerk of the buck warrants. It was in 1756 that his personal reputation received its first grand shock from the exposure of Dr. Douglas, who next year published a second tract, as fully condemnatory of his literary character. This latter production, entitled *Bower and Tillemont compared*, showed that a great part of his *History of the Popes* was nothing more than a translation of the French historian. He endeavoured to repel the attack in three laboured pamphlets; but Dr. Douglas, in a reply, confirmed his original statements by unquestionable documents. Before the controversy ended, Bower had issued his fourth volume, and, in 1757, an abridgment of what was published appeared at Amsterdam. The fifth volume appeared in 1761, during which year he also published *Authentic Memoirs concerning the Portuguese Inquisition, in a Series of Letters to a Friend*, 8vo. The *History of the Popes* was finally completed in seven volumes; and on the 3d of September, 1766, the author died at his house in Bond Street, in the eighty-first year of his age.¹ He was buried in Mary-le-Bone churchyard, where there is a monument to him, bearing the following inscription:—

"A man exemplary for every social virtue. Justly esteemed by all who knew him for his strict honesty and integrity. A faithful friend and a sincere Christian.

"False witnesses rose up against him, and laid to

¹ A letter written at the request of his widow to notify his death to his nephew in Scotland (which I have seen), mentions that he bore a final illness of three weeks "in every way suitable to the character of a good Christian."

his charge things that he knew not; they imagined wickedness in their hearts, and practised it: their delight is in lies: they conspired together, and laid their net to destroy him guiltless: the very abjects came together against him, they gaped upon him with their mouths, they sharpened their tongues like a serpent, working deceitfully; they compassed him about with words of malice, and hated, and fought against him without a cause.

"He endured their reproach with fortitude, suffering wrongfully."

"Unhappy vanity!" exclaims Samuel Ayscough, who preserves the inscription, "thus endeavouring, as it were, to carry on the deception with God, which he was convicted of at the bar of literary justice: how much better would it have been to let his name sink in oblivion than thus attempt to excite the pity of those only who are unacquainted with the history of his life; and, should it raise a desire in any person to inquire, it must turn their pity into contempt."

In Bower we contemplate a man of considerable merit, in a literary point of view, debased by the peculiar circumstances in which he entered the world. A traitor to his own original profession of faith, he never could become a good subject to any other. His subsequent life was that of an adventurer and a hypocrite; and such at length was the dilemma in which he involved himself by his unworthy practices, that, for the purpose of extricating himself, he was reduced to the awful expedient of denying upon oath the genuineness of letters which were proved upon incontestable evidence to be his. Even, however, from the evil of such a life much good may be extracted. The infamy in which his declining years were spent must inform even those to whom good is not good alone for its own sake, that the straight paths of candour and honour are the only ways to happiness, and that money or respect, momentarily enjoyed at the expense of either, can produce no permanent or effectual benefit.

BOWER, WALTER, an historical writer of the fifteenth century, was born at Haddington in 1385. At the age of eighteen he assumed the religious habit; and after finishing his philosophical and theological studies, visited Paris in order to study the laws. Having returned to his native country, he was unanimously elected abbot of St. Colm in the year 1418. After the death of Fordoun, the historian (see that article), he was requested by Sir David Stewart of Rossyth to undertake the completion of the *Scottichronicon*, or *Chronicles of Scotland*, which had been brought up by the above writer only to the 23d chapter of the fifth book. In transcribing the part written by Fordoun, Bower inserted large interpolations. He completed the work in sixteen books, which brought the narrative to the death of James I.; and he is said to have been much indebted for materials to the previous labours of Fordoun. Bower, like Fordoun, wrote in a scholastic and barbarous Latin; and their work, though it must be considered as one of the great fountains of early Scottish history, is characterized by few of the essential qualities of that kind of composition.

BOYD, MARK, an extraordinary genius, who assumed the additional name of ALEXANDER, from a desire of assimilating himself to the illustrious hero of Macedon, was a younger son of Robert Boyd of Pinkell in Ayrshire, who was great-grandson to Robert Boyd, Great Chamberlain of Scotland. Mark Boyd was born on the 13th of January, 1562. His father having died while he was a child, he was educated under the care of his uncle, James Boyd of

Trochrig, titular Archbishop of Glasgow. His headstrong temper showed itself in early youth in quarrels with his instructors, and before he had finished his academical course, he left the care of his friends, and endeavoured to obtain some notice at court. It affords a dreadful picture of the character of Boyd, that, even in a scene ruled by such a spirit as Stuart, Earl of Arran, he was found too violent: one duel and numberless broils in which he became engaged rendered it necessary that he should try his fortune elsewhere. By the advice of his friends, who seem to have given up all hope of his coming to any good in his own country, he travelled to France, in order to assume the profession of arms. While lingering at Paris he lost his little stock of money at dice. This seems to have revived better feelings in his breast. He began to study under various teachers at Paris; then went to the university of Orleans, and took lessons in civil law from Robertus; lastly, he removed to Bourges, where he was received with kindness by the celebrated Cujacins. This great civilian happening to have a crazy fondness for the writings of the early Latin poets, Boyd gained his entire favour by writing a few poems in the barbarous style of Ennius. The plague breaking out at Bourges, he was obliged to flee to Lyons, whence he was driven by the same pestilence into Italy. After spending some time in this country, he returned to France, and is supposed to have there acted for some time as private tutor to a young gentleman named Dauconet. In 1587 commenced the famous wars of the League. Boyd, though a Protestant, or afterwards professing to be so, joined with the Catholic party, in company with his pupil, and for some time led the life of a soldier of fortune. His share in the mishaps of war consisted of a wound in the ankle. In 1588, the Germans and Swiss being driven out of France, the campaign terminated, and Boyd retired to Toulouse, where he recommenced the study of civil law. His studies were here interrupted by a popular insurrection in favour of the Catholic interest, but in which he took no part. Having fallen under some suspicion, probably on account of his country, he was seized by the insurgents, and thrown into prison. By the intercession of some of his learned friends he was relieved from this peril, and permitted to make his escape to Bordeaux. He has left a most animated account of the insurrection, from which it may be gathered that the expedients assumed in more recent periods of French history for protecting cities by barricades, chains, and other devices, were equally familiar in the reign of Henry the Great. For several years Boyd lived a parti-coloured life, alternating between study and war. He had a sincere passion for arms, and entertained a notion that to live entirely without the knowledge and practice of military affairs was only to be *half a man*. It is to be regretted that his exertions as a *soldier* were entirely on the side adverse to his own and his country's faith—a fact which proves how little he was actuated by principle. In the midst of all the broils of the League, he had advanced considerably in the preparation of a series of lectures on the civil law; but he never found an opportunity of delivering them. He also composed a considerable number of Latin poems, which were published in one volume at Antwerp, in 1592. Having now turned his thoughts homewards, he endeavoured in this work to attract the favourable attention of James VI., by a very flattering dedication. But it does not seem to have had any effect. He does not appear to have returned to his native country for some years after this period. In 1595, when his elder brother died, he was still in France. Returning soon after, he is said to have

undertaken the duty of travelling preceptor to John, Earl of Cassillis; and when his task was accomplished, he returned once more. He died of a slow fever, April 10th, 1601, and was buried in the church of Daily.

Mark Alexander Boyd left several compositions behind him, of which a few have been published. The most admired are his *Epistolæ Herodidum*, and his *Hymni*, which are inserted in the *Delicia Poetarum Scotorum*, published at Amsterdam, in 1637. His style in Latin poetry is shown by Lord Hailes to be far from correct, and his ideas are often impure and coarse. Yet when regarded as the effusions of a soaring genius, which seems to have looked upon every ordinary walk of human exertion as beneath it, we may admire the general excellence, while we overlook mean defects. "The Tears of Venus on the Death of Adonis," which has been often extracted from his *Epistolæ*, is sometimes regarded as a beautiful specimen of Latin versification, and in impassioned feeling almost rivalling Pope's *Eloise*. An exact list of the remainder of his compositions, which still lie in manuscript in the Advocates' Library, is given in his life by Lord Hailes, which was one of the few *tentamina* contributed by that great antiquary towards a *Scottish Biographical Dictionary*. Lord Hailes represents the vanity of Boyd as having been very great; but it is obvious that he could offer as high incense to others as to himself. He has the hardihood to compliment the peaceful James VI. as superior to Pallas or Mars: in another place, he speaks of that monarch as having distinguished himself at battles and sieges. It is well known that neither the praise nor the facts were true; and we can only account for such inordinate flattery, by supposing, what there is really much reason to believe, that panegyric in those days was a matter of course, and not expected to contain any truth, or even *vraisemblance*. This theory receives some countenance from a circumstance mentioned by Lord Hailes. The dedication, it seems, in which King James was spoken of as a hardy warrior, was originally written for a real warrior; but the name being afterwards changed, it was not thought necessary to alter the praise; and so the Scottish Solomon, who is said to have shrunk from the very sight of cold iron, stands forth as a second Agamemnon.

BOYD, ROBERT, of Trochrig, an eminent divine of the seventeenth century, was born at Glasgow in 1578. He was the son of James Boyd, "tulchan-archbishop" of Glasgow, and Margaret, daughter of James Chalmers of Gaitgirth, chief of that name. On the death of his father, which happened when he was only three years old, his mother retired to the family residence in Ayrshire, and Boyd, along with Thomas, his younger brother, was in due time sent to the grammar-school of the county town. From thence he was removed to the university of Edinburgh, where he studied philosophy under Mr. Charles Ferme (or Fairholm), one of the regents, and afterwards divinity under the celebrated Robert Rollock. In compliance with the custom of the times, he then went abroad for the purpose of pursuing his studies, and France was destined to be the first sphere of his usefulness. He taught various departments of literature in the schools of Tours and Montauban, at the first of which places he became acquainted with the famous Dr. Rivet. In 1604 he was ordained pastor of the church at Verteuil, and in 1606 he was appointed one of the professors in the university of Saumur, which had been founded in 1593 by the amiable Philip de Mornay, better known by the title of Du Plessis. Boyd also dis-

charged the duties of a pastor in the church at the same town, and, soon after, became professor of divinity. As he had now the intention of remaining for some years abroad, he bethought himself of entering into the married state, and having met with "an honest virgin of the family of Malivern," says Wodrow, "he sought her parents for their consent, who, having received a satisfactory testimonial of the nobility of his birth, and the competency of his estate, they easily yielded; and so he took her to wife, with the good liking of the church and the university, who hoped that by this means he would be fixed among them, so as never to entertain thoughts of returning to Scotland to settle there." But in this they were soon disappointed, for King James having heard through several noblemen, relations of Mr. Boyd, of his worth and talents, offered him the principalship of the university of Glasgow.

The duties of principal in that college were, by the charter of this monarch, not confined even to those connected with that institution. He was required to teach theology on one day, and Hebrew and Syriac the next, alternately; but this was not all. The temporalities of the rectory and vicarage of Govan had been annexed to it, under the condition that the principal should preach on Sunday in the church of that parish. Under these circumstances, it could not be expected that Mr. Boyd could have much leisure to premeditate his lectures. Wodrow informs us that he did not read them, "but uttered all in a continued discourse, without any hesitation, and with as much ease and freedom of speech as the most eloquent divine is wont to deliver his sermons in his mother tongue." It will be remembered that the prelections were then delivered in Latin, and Principal Baillie, who studied under Mr. Boyd, mentions that, at a distance of thirty years, the tears, the solemn vows, and the ardour of the desires produced by the principal's Latin prayers, were still fresh in his memory.¹

From the assimilation which was then rapidly taking place to the Episcopalian form of church government, Mr. Boyd felt his situation peculiarly unpleasant. He could not acquiesce in the decisions of the Perth Assembly, and it could not be expected that he would be allowed to retain his office under any other condition than that of compliance. He therefore preferred voluntarily resigning his office, and retiring to his country residence. Soon after this period he was appointed principal of the university of Edinburgh, and one of the ministers of that city; but there he was not long allowed to remain. His majesty insisted upon his compliance with the Perth articles, and an intimation to that effect having been made to him, he refused, and, to use the quaint expression of the historian, "swa took his leave of them." He was now ordered to confine himself within the bounds of Carrick. His last appointment was to Paisley, but a quarrel soon occurred with the widow of the Earl of Abercorn, who had lately turned Papist, and this was a source of new distress to him. Naturally of a weakly constitution, and worn down by a series of misfortunes, he now laboured under a complication of diseases, which led to his death at Edinburgh, whither he had gone to consult the physicians, on the 5th of January, 1627, in the 49th year of his age.

Of his works, few of which are printed, the largest and best known is his *Praelectiones in Epistolam ad Ephesios*. From the circumstances which occurred in the latter part of his life, he was prevented getting it printed as he intended. After his death a copy

¹ *Boyd's Praelectiones in Epist. ad Ephes. Praefat. ad Lectorem.*

of the MS. was sent to Dr. Rivet, who agreed with Chouet of Geneva for the printing, but when returning to that place with the MS. in his possession, the ship was taken by the Dunkirkers, and the work was seized by some Jesuits, who would part with it "nec prece nec pretio." Fortunately the original still remained, and it was, after many delays, printed "Impensis Societatis Stationariorum," in 1652, folio. To the work is prefixed a memoir of the author, by Dr. Rivet; but as their acquaintance did not commence till 1598 or 1599, there are several errors in his account of the earlier part of Boyd's life, all of which Wodrow has with great industry and accuracy corrected. The only other prose work of Mr. Boyd ever published, is his *Monita de Filii sui Primogeniti Institutione, ex Authoris MSS. Autographis per R(obertum) Sibbald, M.D., edita, 8vo, 1701*. The style of this work, according to Wodrow, is pure, the system perspicuous; and prudence, observation, and piety appear throughout. Besides these, the *Hecatombe ad Christum*, the ode to Dr. Sibbald, and the laudatory poem on King James, are in print. The two first are printed in the *Delicia Poetarum Sotorum*. The *Hecatombe* has been reprinted at Edinburgh in 1701, and subsequently in the *Poetarum Sotorum Musæ Sacrae*. The verses to King James have been printed in Adamson's *Musæ Welcome*; and it is remarkable that it seems to have been altogether overlooked by Wodrow. All these poems justify the opinion that, had Boyd devoted more of his attention to the composition of Latin poetry, he might have excelled in that elegant accomplishment.

In the time of Wodrow several MSS. still remained in the possession of the family of Trochrig, consisting of *Sermons in English and French*, his *Philotheca*, a kind of obituary, extracts from which have lately been printed in the second part of the *Miscellany of the Bannatyne Club*. His life has been written at great length by the venerable historian of the sufferings of the Scottish Church, already frequently quoted. Those who wish to know more of this learned man than the limits of our work will permit, are referred to the very interesting series of the Wodrow biographies in the library of the university of Glasgow—article "Boyd."

BOYD, ZACHARY, an eminent divine and religious writer of the seventeenth century, was born before the year 1590, and was descended from the family of the Boyds of Pinkell, in Carrick (Ayrshire). He was cousin to Mr. Andrew Boyd, Bishop of Argyle, and Mr. Robert Boyd of Trochrig, the subject of the preceding memoir. He received the rudiments of his education at the school of Kilmarnock, and passed through an academical course in the college of Glasgow. About the year 1607 he had finished his studies in his native country. He then went abroad, and studied at the college of Saumur in France, under his relation Robert Boyd. He was appointed a regent in this university, in 1611, and is said to have been offered the principalship, which he declined. According to his own statement, he spent sixteen years in France, during four of which he was a preacher of the gospel. In consequence of the persecution of the Protestants he was obliged, in 1621, to return to his native country. He relates, in one of his sermons, the following anecdote of the voyage:—"In the time of the French persecution I came by sea to Flanders, and as I was sailing from Flanders to Scotland a fearful tempest arose, which made our mariners reel to and fro, and stagger like drunken men. In the meantime, there was a Scots Papist who lay near mee. While the ship gave a great shake, I observed the man, and

after the Lord had sent a calme, I said to him, 'Sir, now ye see the weakness of your religion; as long as ye are in prosperitie, ye cry to this saint and that saint: in our great danger I heard ye cry often, Lord, Lord; but not a word ye spake of our Lady.'" On his reaching Scotland, he further informs us that he "remained a space a private man at Edinburgh, with Doctor Sibbald, the glory and honour of all the physicians of our land." Afterwards he lived successively under the protection of Sir William Scott of Elie, and of the Marquis of Hamilton and his lady at Kinnell; it being then the fashion for pious persons of quality in Scotland to retain one clergyman at least, as a member of their household. In 1623 he was appointed minister of the large district in the suburbs of Glasgow, styled the Barony parish, for which the crypts beneath the cathedral church then served as a place of worship; a scene well fitted by its sepulchral gloom to add to the impressiveness of his Calvinistic eloquence. In this charge he continued all the remainder of his life. In the years 1634-35 and 45 he filled the office of rector of the university of Glasgow—an office which appears from its constituency to have then been very honourable.

In 1629 Mr. Zachary—to use the common mode of designating a clergyman in that age—published his principal prose work, "*The Last Battell of the Soule in Death*;" whereby are shown the diverse skirmishes that are between the soule of man on his death-bed, and the enemies of our salvation, carefully digested for the comfort of the sicke, by &c. Printed at Edinburgh for the heirs of Andro Hart." This is one of the few pious works, not of a controversial nature, produced by the Scottish church before a very recent period; and it is by no means the meanest in the list. It is of a dramatic, or, at least, a conversational form; and the *dramatis personæ*, such as, "Pastour, Sicke Man, Spirituall Friend, Carnal Friend, Sathan, Michael," &c., sustain their parts with such spirit as to show, in connection with his other works of the like nature, that he might have excelled in a department of profane literature, for which, no doubt, he entertained the greatest horror, namely, writing for the stage. The first volume of the work is dedicated, in an English address, to King Charles I., and then in a French one, to his consort Henrietta Maria. It says much for the dexterity of Mr. Zachary, that he inscribes a religious work to a Catholic princess, without any painful reference to her own unpopular faith. He dedicates the second volume to the electress palatine, daughter of James VI., and adds a short piece, which he styles her *Lamentations for the death of her Son*, who was drowned while crossing in a ferry-boat to Amsterdam. The extravagant grief which he describes in this little work is highly amusing. It strikes him that the electress must have conceived a violent antipathy to water, in consequence of the mode of her son's death, and he therefore makes her conclude her lamentations in the following strain:—

"O cursed waters! O waters of Marah, full bitter are yee to me! O element which of all others shall be most detestable to my soule, I shall never wash mine hands with thee, but I shall remember what thou hast done to my best-beloved sonne, the darling of my soule! I shall for ever be a friend to the fire, which is thy greatest foe. Away rivers! away seas! Let me see you no more. If yee were sensible creatures, my dear brother Charles, prince of the European seas, should scourge you with his royal ships; with his thundering cannons he should pierce you to the bottom.

"O seas of sorrowes, O fearfull floodes, O tumb-

ling tempests, O wilfull waves, O swelling surges,
O wicked waters, O dooleful deepes, O pearstest
pooles, O botchful butcher boates, was there no
mercy among you for such an hopefull prince? O
that I could refrain from teares, and *that because
they are salt like yourselves!*" &c.

Childish as this language is in spirit, it is perhaps
in as good taste as most of the elegies produced
either by this or by a later age.

Mr. Zachary appears to have been naturally a
high loyalist. In 1633, when Charles I. visited his
native dominions to go through the ceremony of
his coronation, Mr. Zachary met him, the day after
that solemnity, in the porch of Holyrood Palace,
and addressed him in a Latin oration, couched in
the most exalted strains of panegyric and affection.
He afterwards testified this feeling under circum-
stances more apt to test its sincerity. When the
attempt to impose the Episcopal mode of worship
upon Scotland caused the majority of the people to
unite in a covenant for the purpose of maintaining
the former system, all who were connected with
Glasgow College, together with Mr. Zachary, set
themselves against the document, because, although
well meant and urgently necessary, it was feared that
it might become a stumbling-block in the subsequent
proceedings of the country. These divines resolved
rather to yield a little to the wishes of their sovereign,
than fly into open rebellion against him. Mr.
Robert Baillie paid them a visit to induce them to
subscribe the covenant, but was not successful; "we
left them," says he, "resolved to celebrate the com-
munion on Pasch in the High Church, *kneding.*"
This must have been about a month after the sub-
scription of the covenant had commenced. Soon
afterwards, most of these recusants, including Mr.
Zachary, found it necessary to conform to the national
movement. Baillie says, in a subsequent letter:
"At our townsmen's desire, Mr. Andrew Cant and
Mr. J. Rutherford were sent by the nobles to preach
in the High Kirk, and receive the oaths of that
people to the covenant. Lord Eglintoune was
appointed to be a witness there. With many a sigh
and tear, by all that people the oath was made.
Provost, bailies, council, all except three men, held
up their hands; *Mr. Zacharias*, and Mr. John Bell,
younger, has put to their hands. The college, it is
thought, will subscribe, and almost all who refused
before."

Though Boyd was henceforth a faithful adherent
of this famous bond, he did not take the same active
share with some of his brethren in the military pro-
ceedings by which it was supported. While Baillie
and others followed the army, "as the fashion was,
with a sword and pair of Dutch pistols at their
saddles," he remained at home in the peaceful exer-
cise of his calling, and was content to sympathize in
their successes by hearsay. He celebrated the fight
at Newburnford, August 28, 1640, by which the
Scottish covenanting army gained possession of New-
castle, in a poem of sixteen 8vo pages, which is
written, however, in such a homely style of versifica-
tion, that we would suppose it to be among the very
earliest of his poetical efforts. It opens with a
panegyric on the victorious Leslie, and then proceeds
to describe the battle.

"The Scots cannons powder and ball did sweep,
Which with terror the Canterburians slew.
Balls rushed at random, which most fearfully
Menaced to break the portals of the sky,

In this conflict, which was both sowre and surly,
Bones, blood, and braines went in a *hurly-burly*,
All was made *hodge-podge*," &c.

1 Baillie's Letters, i. 174.

The pistol-bullets were almost as bad as the cannon-
balls. They—

"—— in squadrons came, like fire and thunder,
Men's hearts and heads both for to pierce and plunder;
Their errand was 'when it was understood,'
To bathe men's bosoms in a scarlet flood."

At last comes the wail for the fallen—

"In this conflict, which was a great pitie,
We lost the son of Sir Patrick Makgie."

In 1643 he published a more useful work in his
*Crosses, Comforts, and Councils, needfull to be con-
sidered and carefully to be laid up in the Hearts of the
Godly, in these Boysterous Broiles, and Bloody Times.*
We also find from the titles of many of his manuscript
discourses, that, with a diligent and affectionate zeal
for the spiritual edification of the people under his
charge, he had improved the remarkable events of
the time as they successively occurred.

That the reluctance of Mr. Zachary to join the
Covenanters did not arise from timidity of nature,
seems to be proved by an incident which occurred
at a later period of his life. After the death of
Charles I. it is well known that the Scottish Presby-
terians made a gallant effort to sustain the royal
authority against the triumphant party of Indepen-
dents. They invited home the son of the late king,
and rendered him at least the limited monarch of
Scotland. Cromwell, having crossed the Tweed
with an army, overthrew the Scottish forces at
Dunbar, September 3, 1650; and gained possession
of the southern portion of the country. Glasgow
was, of course, exposed to a visit from this unscrupu-
lous adversary. "Cromwell," says Baillie, "with the
whole body of his army, comes peaceably to Glasgow.
The magistrates and ministers all fled away; I got
to the Isle of Cniray, with my Lady Montgomery,
but left all my family and goods to Cromwell's
courtesy, which indeed was great, for he took such
measures with the soldiers, that they did less dis-
pleasure at Glasgow than if they had been at London,
*though Mr. Zachary Boyd railed on them all to their
very face in the High Church.*" This was on the
13th of October, and we learn from a manuscript
note upon the preacher's own Bible, that the chapter
which he expounded on this occasion was Dan. viii.
In this is detailed the vision of the ram with two
horns, which is at first powerful, but at length over-
come and trampled down by a he-goat; being an
allegory of the destruction of the kings of Media and
Persia by Alexander of Macedon. It is evident that
Mr. Zachary endeavoured to extend the parable to
existing circumstances, and of course made out
Cromwell to be the *he-goat*. The preacher further
chose for a text the following passage in the Psalms:
—"But I as a deaf man heard not; and I was as a
dumb man that openeth not his mouth. Thus I was
as a man that heareth not, and in whose mouth are
no reproofs. For in thee, O Lord, do I hope: thou
wilt hear, O Lord my God" (Ps. xxxviii. 13-15).
This sermon was probably by no means faithful to
its text, for certainly Mr. Zachary was not the man
to keep a mouth clear of reproofs when he saw occa-
sion for blame. The *exposition*, at least, was so full
of bitter allusions to the sectarian general, that one
of his officers is reported to have whispered in his
ear for permission "to pistol the scoundrel." Crom-
well had more humanity and good sense than to
accede to such a request. "No, no," said he; "we
will manage him in another way." He asked Mr.
Zachary to dine with him, and gained his re-
spect for the fervour of the devotions in which he
spent the evening. It is said that they did not

finish their mutual exercise till three in the morning.¹

Mr. Zachary did not long survive this incident. He died about the end of the year 1653, or the beginning of 1654, when the famous Mr. Donald Cargill was appointed his successor. "In the conscientious discharge of his duty as a preacher of God's word, which he had at the same time exercised with humility, he seems, whether in danger or out of it, to have been animated with a heroic firmness. In a mind such as his, so richly stored with the noble examples furnished by sacred history, and with such a deep sense of the responsibility attached to his office, we are prepared to expect the same consistency of principle, and decision of conduct in admonishing men, even of the most exalted rank.

... We have every reason to suppose that the tenor of his conduct in life became the high office of which he made profession. From the sternness with which he censures manners and customs prevalent in society, the conforming to many of which could incur no moral guilt, it is to be presumed that he was of the most rigid and austere class of divines. . . . We are ignorant of any of the circumstances attending his last moments, a time peculiarly interesting in the life of every man; but from what we know of him, we may venture to say, without the hazard of an erroneous conclusion, that his state of mind at the trying hour was that of a firm and cheerful expectation in the belief in the great doctrines of Christianity which he had so earnestly inculcated, both from the pulpit and the press, with the additional comfort and support of a long and laborious life in his Master's service. About twenty-five years before his death, he was so near the verge of the grave, that his friends had made the necessary preparation for his winding-sheet, which he afterwards found among his books. He seems to have recovered from the disease with a renewed determination to employ the remainder of his life in the cause to which he had been previously devoted: he pursued perseveringly to near its termination this happy course, and just lived to complete an extensive manuscript work, bearing for its title *The Notable Places of the Scripture Expounded*, at the end of which he adds, in a tremulous and indistinct handwriting, "Heere the author was neere his end, and was able to do no more, March 3d, 1653."²

Mr. Zachary had been twice married, first to Elizabeth Fleming, of whom no memorial is preserved, and secondly, to Margaret Mure, third daughter of William Mure of Glanderstoun (near Neilston, Renfrewshire). By neither of his wives had he any offspring. The second wife, surviving him, married for her second husband the celebrated Durham, author of the *Commentary on the Revelation*—to whom, it would appear, she had betrayed some partiality even in her first husband's lifetime. There is a traditional anecdote, that, when Mr. Zachary was dictating his last will, his spouse made one modest request, namely, that he would bequeath something to Mr. Durham. He answered, with a sarcastic reference to herself, "I'll lea' him what I canna keep frae him." He seems to have possessed

¹ The accurate editor of a new edition of *The Last Battell of the Soule* (Glasgow, 1831), from whose memoir of Mr. Zachary most of these facts are taken, blames Mr. Baillie, in my opinion unjustly, for having fled on this occasion, while Mr. Zachary had the superior courage to remain. It should be recollected that Mr. Baillie had particular reason to dread the vengeance of Cromwell and his army, having been one of the principal individuals concerned in the bringing home of the king, and consequently in the provocation of the present war.

² Life prefixed to new edition of *The Last Battell of the Soule*.

an astonishing quantity of worldly goods for a Scottish clergyman of that period. He had lent 11,000 merks to Mure of Rowallan, 5000 to the Earl of Glencairn, and 6000 to the Earl of Loudon; which sums, with various others, swelled his whole property in money to £4527. This, after the deduction of certain expenses, was divided, in terms of his will, between his relict and the college of Glasgow. About £20,000 Scots is said to have been the sum realized by the college, besides his library and manuscript compositions; but it is a mistake that he made any stipulation as to the publication of his writings, or any part of them. To this splendid legacy we appear to be chiefly indebted for the present elegant buildings of the college, which were mostly erected under the care of Principal Gillespie during the period of the Commonwealth. In gratitude for the munificent gift of Mr. Zachary, a bust of his figure was erected over the gateway within the court, with an appropriate inscription. There is also a portrait of him in the divinity hall of the college. Nineteen works, chiefly devotional and religious, and none of them of great extent, were published by Mr. Zachary during his lifetime; but these bore a small proportion to his manuscript writings, which are no less than eighty-six in number, chiefly comprised within thirteen quarto volumes, written in a very close hand, apparently for the press. Besides those contained in the thirteen volumes, are three others—*Zion's Flowers, or Christian Poems for Spiritual Edification*, 2 vols. 4to; *The English Academic, containing Precepts and Purpose for the Weal both of Soul and Body*, 1 vol. 12mo; and *The Four Evangelists in English Verse*.

"Mr. Boyd appears to have been a scholar of very considerable learning. He composed in Latin, and his qualifications in that language may be deemed respectable. His works also bear the evidence of his having been possessed of a critical knowledge of the Greek, Hebrew, and other languages. As a prose writer, he will bear comparison with any of the Scottish divines of the same age. He is superior to Rutherford, and, in general, more grammatically correct than even Baillie himself, who was justly esteemed a very learned man. His style may be considered excellent for the period. Of his characteristics as a writer, his originality of thought is particularly striking. He discusses many of his subjects with spirit and ingenuity, and there is much which must be acknowledged as flowing from a vigorous intellect, and a fervid and poetical imagination. . . . We have now to notice Mr. Boyd in the character in which he has hitherto been best known to the world, namely, in that of a poet. One of his most popular attempts to render himself serviceable to his country was in preparing a poetical version of the book of Psalms for the use of the church. It had been previous to 1646 that he engaged in this, as the Assembly of 1647, when appointing a committee to examine Rous's version, which had been transmitted to them by the Assembly at Westminster, 'recommended them to avail themselves of the psalter of Rowallan, and of Mr. Zachary Boyd, and of any other poetical writers.' It is further particularly recommended to Mr. Zachary Boyd to translate the other Scriptural songs in metre, and to report his travails therein to the commission of that Assembly: that after their examination thereof they may send the same to the presbyteries to be there considered until the next General Assembly. (*Assembly Acts*, Aug. 28, 1647.) Mr. Boyd complied with this request, as the Assembly, Aug. 10, 1648, 'recommends to Mr. John Adamson and Mr. Thomas Crawford to revise the labours of Mr. Zachary Boyd upon the other Scripture songs, and

to prepare a report thereof to the said commission for public affairs,' who, it is probable, had never given in any 'report of their labours.' Of his version Baillie had not entertained a high opinion, as he says, 'Our good friend, Mr. Zachary Boyd, has put himself to a great deal of pains and charges to make a psalter, but I ever warned him his hopes were groundless to get it received in our churches, yet the flatteries of his unadvised neighbours makes him insist in his fruitless design.' There seems to have been a party who did not undervalue Mr. Boyd's labours quite so much as Baillie, and who, if possible, were determined to carry their point, as, according to Baillie's statement, 'the Psalms were often revised, and sent to presbyteries,' and, 'had it not been for some who had more regard than needed to Mr. Zachary Boyd's psalter, I think they (*Rous's version*) had passed through in the end of last Assembly; but these, with almost all the references from the former Assemblies, were remitted to the next.' On 23d November, 1649, Rous's version, revised and improved, was sanctioned by the commission with authority of the General Assembly, and any other discharged from being used in the churches, or its families. Mr. Boyd was thus deprived of the honour to which he aspired with some degree of zeal, and it must have been to himself and friends a source of considerable disappointment.

"Among other works, he produced two volumes, under the title of *Zion's Flowers, or Christian Poems for Spiritual Edification*, and it is these which are usually shown as his bible, and have received that designation. These volumes consist of a collection of poems on select subjects in Scripture history, such as that of 'Josiah,' 'Jephtha,' 'David and Goliath,' &c., rendered into the dramatic form, in which various 'speakers' are introduced, and where the prominent facts of the Scripture narrative are brought forward, and amplified. We have a pretty close parallel to these poems in the *Ancient Mysteries* of the thirteenth and fourteenth centuries, and in the sacred dramas of some modern writers."

The preceding criticism and facts which we have taken the liberty to borrow from Mr. Neil,¹ form an able and judicious defence of the memory of this distinguished man. As some curiosity, however, may reasonably be entertained respecting compositions which excited so much vulgar and ridiculous misrepresentation, we shall make no apology for introducing some specimens of Mr. Boyd's poetry—both of that kind which seems to have been dictated when his Pegasus was careering through "the highest heaven of invention," and of that other sort which would appear to have been conceived while the sacred charger was cantering upon the mean soil of this nether world, which it sometimes did, I must confess, very much after the manner of the most ordinary beast of burden. The following "Morning Hymn for Christ," selected from his work entitled *The English Academie*, will scarcely fail to convey a respectful impression of the writer:—

"O Dayspring from on high,
Cause pass away our night;
Clear first our morning sky,
And after shine thou bright.

"Of lights thou art the Light,
Of righteousness the Sun;
Thy beams they are most bright,
Through all the world they run.

"The day thou hast begun
Thou wilt it clearer make;
We hope to see this Sun
High in our zodiac.

"O make thy morning dew
To fall without all cease;
Do thou such favour show
As unto Gideon's fleece.

"O do thou never cease
To make that dew to fall—
The dew of grace and peace,
And joys celestial.

"This morning we do call
Upon thy name divine,
That thou among us all
Cause thine Aurora shine.

"Let shadows all decline,
And wholly pass away,
That light which is divine,
May bring to us our day:

"A day to shine for aye,
A day that is most bright,
A day that never may
Be followed with a night.

"O, of all lights the light,
The Light that is most true,
Now banish thou our night,
And still our light renew.

"Thy face now to us show
O Son of God most dear;
O Morning-star, most true,
Make thou our darkness clear.

"Nothing at all is here,
That with thee may compare;
O unto us draw near,
And us thy children spare!

"Thy mercies they are rare,
If they were understood;
Wrath due to us thou bare,
And for us shed thy blood.

"Like beasts they are most rude,
Whom reason cannot move—
Thou most perfectly good,
Entirely for to love.

"Us make mind things above,
Even things that most excel;
Of thine untaunted love,
Give us the sacred seal.

"O that we light could see
That shineth in thy face!
So at the last should we
From glory go to grace.

"Within thy sacred place
Is only true content,
When God's seen face to face,
Above the firmament.

"O that our hours were spent
Among the sons of men,
To praise the Omnipotent,
Amen, yea, and Amen!"

The Indicrous passages are not many in number. The following is one which Pennant first presented to the world; being the soliloquy of Jonah within the whale's belly; taken from *The Flowers of Zion*:—

"Here apprehended I in prison ly;
What goods will ransom my captivity?
What house is this, where's neither coal nor candle,
Where I nothing but guts of fishes handle?
I and my table are both here within,
Where day neere dawned, where sunne did never shine;
The like of this on earth man never saw,
A living man within a monster's maw.
Buried under mountains which are high and steep,
Plunged under waters hundreth fathoms deep.
Not so was Noah in his house of trees,
For through a window he the light did see;
Hee sailed above the highest waves;—a wonder,
I and my boat are all the waters under;
Hee in his ark might goe and also come,
But I sit still in such a straitened roome
As is most uncouth, head and feet together,
Among such grease as would a thousand smother.
I find no way now for my shrinking hence,
But heere to lie and die for mine offence.
Eight prisoners were in Noah's hulk together,
Comfortable they were, each one to other;
In all the earth like unto mee is none,
Far from all living, I heere lye alone,
Where I entomb'd in melancholy sunk,
Choakt, suffocat, &c.

¹ *Life of Zachary Boyd*, prefixed to the new edition of his *Last Battell of the Soule*.

And it is strange that, immediately after this grotesque description of his situation, Pegasus again ascends, and Jonah begins a prayer to God, conceived in a fine strain of devotion.

BRISBANE, GENERAL SIR THOMAS MACDOUGALL, Bart., G.C.B., &c. This gallant soldier and talented astronomer was born, we believe, in 1773. His ancestors were the Brisbanes of Bishopton, a family of note in their day, whose possessions extended in the fourteenth century from Erskine Ferry, on the Clyde, to Largs; and one of them, William Brisbane, according to Lord Hailes, held in 1332 the high office of chancellor of the kingdom of Scotland. In 1789, Sir Thomas entered the army with the rank of ensign, in the 38th infantry, then stationed in Ireland, and on joining his regiment he was so fortunate as to form an intimate acquaintance with the future Duke of Wellington, at that time unknown to fame, and a young lieutenant in a regiment of cavalry. When the war broke out in 1793, Sir Thomas raised an independent company in Glasgow, with which he joined the 53d at Edinburgh, with the rank of captain; and as this regiment formed part of the army of the Duke of York, Sir Thomas shared in all the battles, reverses, and hardships of that distinguished campaign. This was especially the case at the engagement of Lille; where he was not only himself severely wounded, but had twenty-two men killed and wounded out of the thirty-three composing his company.

In the spring of 1795 Sir Thomas Brisbane returned to England with his regiment, in which he had obtained a majority by purchase, and embarked in the expedition to the West Indies under Sir Ralph Abercrombie. Among the other gallant exploits of the young major in the West India campaign of 1796, one of them is particularly commemorated. Being ordered to attack a fort which was generally supposed to be all but impregnable, he was met on his march by a brother officer, who, on learning the nature of his expedition, bewailed its rashness, and represented that the fort could not be taken. "It *can* be taken," replied the other hopefully; "for I have the order in my pocket." However veterans might smile at this confidence and the cause that inspired it, Sir Thomas was successful, and the fort was captured. He was also at the reduction of St. Lucia, the siege of Morne-Fortune, the encounters of Chalcot, Castries, and Vigie; and in the reduction of the island of St. Vincent, and during the whole of the Caribbean warfare.

His health having suffered from the West India climate, the friends of Sir Thomas purchased for him the colonelcy of the 69th regiment, which had just returned from the West Indies; but on arriving in England, in 1799, he found that the regiment had been unexpectedly sent back to its old quarters. Having recruited his health as hastily as he could, he returned to Jamaica; and, taught by his own experience, he paid there such attention to the health of his men, that on the return of the regiment to England in 1802, only one invalid was left behind. On the regiment being ordered to India, Sir Thomas, in consequence of a severe liver complaint, endeavoured to obtain an exchange into the guards or the cavalry, but being unable to effect it, he was obliged for a time to retire upon half-pay. In 1810 he was appointed assistant adjutant-general to the staff at Canterbury, until he was promoted to the command of a brigade under the Duke of Wellington, whom he joined at Coimbra in 1812. He accompanied the army during the whole of the eventful war in the Peninsula, and as his brigade formed

a part of Picton's fighting division, Sir Thomas found no lack of military service or personal danger during the whole campaign. His gallant services, however, in its memorable engagements, were crowned with clasps of distinction and parliamentary thanks, and when the war was removed into France, he was present at the battles of Orthes and Toulouse. After the abdication of Napoleon, Sir Thomas was sent to North America, and at the unfortunate affair on Lake Champignon he was ordered to cover the retreat, which he effectually accomplished without loss, by the destruction of the bridge across the Dead Creek. The value of his services in this disastrous campaign in North America was attested by the grand cross of the Bath, which was conferred upon him by government.

The escape of Napoleon from Elba occasioned the recall of Sir Thomas and his brigade from America, and he arrived off the coast of France with twelve regiments, comprising about 10,000 men; but they were too late to participate in the glories of Waterloo. The appearance of such a powerful contingent, on being reviewed before the Duke of Wellington, drew from him the exclamation, "Had I had these regiments at Waterloo, I should not have wanted the Prussians." Sir Thomas remained in France with the army of occupation until 1818, and his scientific attainments being appreciated, he was during this sojourn in Paris unanimously elected a corresponding member of the Institute of France. On his return, he in 1819 married Anna Maria, only daughter of Sir Henry Hay Macdougall, the representative of a very ancient Scottish family, on whose death he succeeded, in right of his wife, to valuable estates, and assumed the name of Macdougall prefixed to his own surname. In 1820 he was appointed to the staff in Ireland, where he commanded the Munster district until the following year, when, by the recommendation of the Duke of Wellington, he was appointed governor of New South Wales.

The period of his soldier-life was ended, but a new and more difficult one had commenced. He was now the governor of a penal settlement containing a population of about 38,000 souls bond and free, but in which the convict population rather predominated, and where, from the nature of such a people, all the vices of an impaired state of society were to be found, with few of its redeeming virtues. To such materials our military officers were accustomed, where their regiments were chiefly composed of the dissolutely idle and the emptyings of our prisons; and government, that saw how such unpromising materials were manufactured into brave, obedient, and orderly soldiers, hoped for a similar result in their selection of military governors to rule the convict colony. But they forgot that this could only be accomplished by placing the population under martial law, and in vesting the governor with an arbitrary and irresponsible military power to reward and punish. The bond and free, though always at war with each other, were at one in hating and opposing their ruler; and from the *Magna-Charta* which was permitted to New South Wales, its governors were charged with all those evils which they had neither the means nor authority to redress. It was thus that Sir Thomas Brisbane found Australia at the close of 1821, when he entered upon his antipodean government: everything was so reversed, both physically and mentally, that to see them aright he must have stood upon his head. Of course, his administration was complained of, but this was inevitable, and he only added one name more to the list of New South Wales governors who had successively been worried, calumniated, and wearied out. It

was much, however, that he was, upon the whole, the least unpopular of all who had held the office, and that his departure from the colony was witnessed with regret. Who at that time would have conjectured, or even have dreamed, that only forty years after the population of Australia would be increased more than fiftyfold, and that it would be one of the wealthiest, as well as most populous, of all colonies?

In spite of these great impediments, the administration of Sir Thomas Brisbane during the four years of his rule in New South Wales was neither inert nor unproductive; and of his labours as governor the following brief summary is given by his biographer:—"He improved the condition of the convicts, substituted useful labour for the treadmill, and above all gave them the blessing of hope by offering tickets of leave for good conduct. At his own expense he introduced into the colony good breeds of horses, as well as the cultivation of the vine, the sugar-cane, cotton, and tobacco." These industrial arts and improvements were what the colony especially needed, and as much perhaps as his limited commission could overtake in a society so constituted. But an act by which he especially distinguished himself will endear him to every lover of science. Availing himself of the bright pure sky of Australia to prosecute his favourite study of astronomy, he established a large observatory at his residence at Paramatta, which was afterwards continued by government; and there, by his careful observations, fixed the positions of, and catalogued, 7385 stars hitherto scarcely known to astronomers. For this splendid work, *The Brisbane Catalogue of Stars*, he was honoured with the Copley medal from the Royal Society, a reward which he preferred to all his military distinctions. The degree of D.C.L. was also conferred upon him by the universities of Oxford and Cambridge.

Sir Thomas Brisbane returned from Australia at the close of 1825, and established his residence chiefly at Makerstoun, the property of Lady Brisbane. Here he established both an astronomical and a magnetic observatory, and with the aid of a staff of very able observers, he compiled three large volumes of observations, which were published in the *Transactions* of the Royal Society of Edinburgh. Military honours still continued to flow upon him. In 1826 government conferred upon him the colonelcy of the 34th regiment; he was offered the command of the troops in Canada, and soon afterwards the chief command in India; but from the counsels of his medical advisers he was induced to decline both of these honourable appointments. In 1835 he was created a baronet; in 1837 he received the Grand Cross of the order of the Bath; and in 1841 he was made a general in the army. On the death of Sir Walter Scott he was elected president of the Royal Society, Edinburgh. He also founded two gold medals as rewards for scientific merit—one for the Royal Society, and the other for the Society of Arts. After a long life spent in distinction and usefulness, the first part as a gallant soldier, and the last as a man of science, Sir Thomas Macdougall Brisbane died at Brisbane House, on January 31, 1860, at the age of eighty-seven; and as he left no children he was succeeded by his nephew, the son of Admiral Brisbane.

BROWN, JAMES, a traveller and scholar of some eminence, was the son of James Brown, M.D., who published a translation of two *Orationes of Isocrates*, without his name, and who died in 1733. The subject of this article was born at Kelso, May 23, 1709, and was educated at Westminster school, where he made great proficiency in the Latin and

Greek classics. In the year 1722, when less than fourteen years of age, he accompanied his father to Constantinople, where, having naturally an aptitude for the acquisition of languages, he made himself a proficient in Turkish, modern Greek, and Italian. On his return in 1725 he added the Spanish to the other languages which he had already mastered. About 1732 he was the means of commencing the publication of the *London Directory*, a work of vast utility in the mercantile world, and which has since been imitated in almost every considerable town in the empire. After having laid the foundation of this undertaking, he transferred his interest in it to Mr. Henry Kent, a printer in Finch Lane, Cornhill, who carried it on for many years, and eventually, through its means, acquired a fortune and an estate. In 1741 Brown entered into an engagement with twenty-four of the principal merchants in London, to act as their chief agent in carrying on a trade, through Russia, with Persia. Having travelled to that country by the Wolga and the Caspian Sea, he established a factory at Reshd, where he continued nearly four years. During this time he travelled in state to the camp of the famous Kouli Khan, with a letter which had been transmitted to him by George II. for that monarch. He also rendered himself such a proficient in the Persian language, as to be able, on his return, to compile a copious dictionary and grammar, with many curious specimens of Persian literature, which, however, was never published. A sense of the dangerous situation of the settlement, and his dissatisfaction with some of his employers, were the causes of his return; and his remonstrances on these subjects were speedily found to be just, by the factory being plundered of property to the amount of £80,000, and a period being put to the Persian trade. From his return in 1746 to his death, which took place in his house at Stoke-Newington, November 30, 1788, he appears to have lived in retirement upon his fortune. In the obituary of the *Gentleman's Magazine* he is characterized as a person of strict integrity, unaffected piety, and exalted but unostentatious benevolence.

BROWN, JOHN, author of the *Self-Interpreting Bible*, and many popular religious works, was born in the year 1722 at Carpow, a village in the parish of Abernethy and county of Perth. In consequence of the circumstances of his parents, he was able to spend but a very limited time at school in acquiring the elements of reading, writing, and arithmetic. "One month," he has himself told us, "without his parents' allowance, he bestowed upon Latin." His thirst for knowledge was intense, and excited him, even at this early period, to extraordinary diligence in all departments of study, but particularly to religious culture. About the eleventh year of his age he was deprived by death of his father, and soon after of his mother, and was himself reduced, by four successive attacks of fever, to a state which made it probable that he was about speedily to join his parents in the grave. But having recovered from this illness, he had the good fortune to find a friend and protector in John Ogilvie, a shepherd venerable for age and eminent for piety, yet so destitute of education as to be unable even to read. To supply his own deficiency, Ogilvie was glad to engage young Brown to assist him in tending his flock, and read to him during the intervals of his occupation. To screen themselves from the storm and the heat, they built a little lodge among the hills, and to this their mountain *tabernacle* (long after pointed out under this name by the peasants) they frequently repaired to celebrate their pastoral devotions.

Ogilvie having soon retired from his occupation as a shepherd, and settled in the town of Abernethy, young Brown entered the service of a neighbouring farmer, who maintained a more numerous establishment than his former friend. This step he laments as having been followed by a sensible decline of religious attainments, and a general lukewarmness in religious duty, although his external character was remarkably distinguished by many virtues, and especially by the rare and truly Christian grace of meekness. In the year 1733 four ministers of the Church of Scotland, among whom was Mr. Moncrieff of Abernethy, declared a secession from its judicatures, alleging as their reasons for taking this step the following list of grievances:—"The sufferance of error without adequate censure; the infringement of the rights of the Christian people in the choice and settlement of ministers under the law of patronage; the neglect or relaxation of discipline; the restraint of ministerial freedom in opposing maladministration, and the refusal of the prevailing party to be reclaimed." To this body our young shepherd early attached himself, and ventured to conceive the idea of one day becoming a shepherd of souls in that connection. He accordingly prosecuted his studies with increasing ardour, and began to attain considerable knowledge of Latin and Greek. These acquisitions he made entirely without aid from others, except at an occasional hour when he sought a solution of such difficulties as his unaided efforts could not master, from two neighbouring clergymen—the one Mr. Moncrieff of Abernethy, who has just been mentioned as one of the founders of the secession, and the other Mr. Johnston of Arngask, father of the late venerable Dr. Johnston of North Leith; both of whom were very obliging and communicative, and took great interest in promoting the progress of the studious shepherd-boy. An anecdote has been preserved of this part of his life and studies which deserves to be mentioned. He had now acquired so much knowledge of Greek as encouraged him to hope that he might be able to read the New Testament in its original language. Full of this hope, he became anxious to possess a copy of the invaluable volume, and for this purpose set out on a midnight journey to St. Andrew's, a distance of twenty-four miles. Having reached his destination in the morning, he repaired to the nearest bookseller, and asked for a copy of the Greek New Testament. The master of the shop, astonished by such an application from so unlikely a person, was rather disposed to taunt him with its presumption. Meanwhile a party of gentlemen, said to have been professors in the university, entered the shop, and having understood the matter, questioned the lad about his employment and studies. After hearing his tale, one of them ordered the volume to be brought, and throwing it down upon the table, "Boy," said he, "read that book, and you shall have it for nothing." Young Brown acquitted himself to the admiration of his judges, carried off his cheaply-purchased Testament in triumph, and, ere the evening arrived, was studying it in the midst of his flock upon the hills of Abernethy.

His extraordinary acquisitions about this time subjected him to a suspicion that he received a secret aid from the enemy of man, upon the pledge of his own soul. It was probably in consequence of this annoyance that he abandoned the occupation of a shepherd, and undertook that of pedlar or travelling-merchant. This mode of life was once of much greater importance and higher esteem in Scotland than at present, when the facilities of communication have been multiplied to such a degree, and was often

pursued by persons of great intelligence and respectability. Its peculiar tendency to imbue the mind with a love of nature, and form it to a knowledge of the world, have been finely illustrated by a great poet of our day: nor is the Scottish pedlar of the *Excursion*, though certainly somewhat too metaphysical, the unnatural character which it has been represented. It will not, however, be considered very surprising that young Brown did not shine in his new profession. During his mercantile peregrinations, which lay chiefly in the interior parts of Fife and Kinrossshire, he made it a rule to call at no house of which the family had not the character of being religious and given to reading. When he was received into any such dwelling, his first care was to have all the books it could furnish collected together, among which, if he did but light upon a new one, he fell to the literary feast, losing in the appetite of the soul the hunger of the body, and forgetting the merchandise of pedlar's wares. It is related, that the contents of his pack, on his return to headquarters, used to present a lively image of chaos, and that he was very glad to express his obligations to any neat-handed housewife who would take the arrangement of them upon herself. Many a time and oft was he prudently reminded of the propriety of attending more to his business, and not wasting his time on what did not concern him—till his monitors at last gave up the case, and wisely shaking their heads, pronounced him "good for nothing but to be a scholar."

Soon after the close of the rebellion of 1745, during which he served as a volunteer in the regiment of militia raised by the county of Fife, in behalf of the government, he resolved to undertake the more dignified duties of schoolmaster. He established himself in 1747 at Gainry Bridge, a village in the neighbourhood of Kinross, and there laid the foundation of a school which subsisted for a considerable time, and, fifteen years after, was taught by another individual whose name has also become favourably known to the world—the tender and interesting young poet, Michael Bruce. During Mr. Brown's incumbency, which lasted for two years, this school was remarkably successful, and attracted scholars from a considerable distance. He afterwards taught for a year and a half another school at Spittal, in the congregation of Linton, under Mr. James Mair. The practical character of his talents, the accuracy of his learning, the intimate experience which, as a self-taught scholar, he must have had of elementary difficulties and the best mode of solving them, must have peculiarly qualified him for the discharge of his present duties. Nor did he relax the while in the prosecution of his own. On the contrary, his ardour seems to have led him into imprudent extremes of exertion. He would commit to memory fifteen chapters of the Bible as an evening exercise after the labours of the day, and after such killing efforts, allow himself but four hours of repose. To this excess of effort he was probably stimulated by the near approach of the period to which he had long looked forward with trembling hope—the day which was to reward the toils and trials of his varied youth, by investing him with the solemn function of an ambassador of Christ. During the vacations of his school he was now engaged in the regular study of philosophy and divinity under the inspection of the Associate Synod, and the superintendence of the Rev. Ebenezer Erskine, and James Fisher, two of the original founders, and principal lights, of the Secession church. At length, in the year 1751, having completed his preparatory course of study, and approved himself on trial before the Associate Presbytery

of Edinburgh, he was licensed by that reverend body, at Dalkeith, to preach the gospel in their society. He had not been long a probationer when he received two nearly simultaneous calls to the settled discharge of ministerial duty; one from the congregation of Stow, a village in the shire of Edinburgh, and the other from that of Haddington, the principal town in the county of that name. The presbytery of Edinburgh, within whose bounds both congregations were included, and which had therefore, according to the Presbyterian constitution, the right of deciding between their competing claims, submitted the matter to his own discretion. His choice was determined to Haddington, and over this congregation therefore he was finally ordained pastor in the month of June, 1751. It deserves to be mentioned, however, that he continued regularly to visit and examine the congregation of Stow until it was supplied with a regular minister.

To the duties of the sacred office he devoted himself with the most zealous and laborious industry. The smallness of his congregation enabled him at once to undertake the widest range of ministerial duty, and to execute it with the greatest minuteness and accuracy. Besides regularly preaching four discourses every Sunday during the summer, and three during winter in his own place of worship, and occasionally in the country during the week, he visited all his people annually in his pastoral capacity, and carried them twice in the same period through a course of public catechetical examinations. He was very assiduous in his visits to the sick and the afflicted, and that not merely to those of his own congregation, but to all of every denomination who desired his services. The peculiar characteristic of his manner of address on all these occasions, public and private, was an intense solemnity and earnestness, which extorted attention even from the scorner, and was obviously the genuine expression of his own overwhelming sense of the reality and importance of the message. "His grave appearance," says a late English divine who had attended his ministry for some time, "his solemn, weighty, and energetic manner of speaking used to affect me very much. Certainly his preaching was close, and his address to the conscience pungent. Like his Lord and Master, he spoke with authority and hallowed pathos, having tasted the sweetness and felt the power of what he delivered." To the same effect the celebrated David Hume, having been led to hear him preach on one occasion at North Berwick, remarked, "That old man preaches as if Christ were at his elbow." Except for his overawing seriousness, and occasionally a melting sweetness in his voice, it does not appear that his delivery was by any means attractive. "It was my mercy," he says, with characteristic modesty, that "the Lord, who had given me some other talents, withheld from me a popular delivery, so that, though my discourses were not disrelished by the serious, so far as I heard, yet they were not so agreeable to many hearts as those of my brethren, which it was a pleasure to me to see possessed of that talent which the Lord, to restrain my pride, had denied to me." His labours were not in vain, and the members of his congregation, the smallness of which he often spoke of as a mercy, seem to have been enabled to walk, in a great measure, suitable to their profession and their privileges. In ecclesiastical policy he was a staunch Presbyterian and Seceder in the original sense of the term, as denoting one separated, not from the constitution of the Established church, either as a church or as an establishment, but from the policy and control of the predominant party in her judicatures. At the unhappy

division of the Secession church in 1745, commonly known by the name of the breach, on the question of making refusal of the burgh oath a term of communion, though personally doubtful of the propriety of a Seceder's swearing the oath in question, he attached himself to that party, who, from declining peremptorily to pronounce it unlawful, obtained the popular appellation of Burghers,—justly considering that a difference of opinion on this point was by no means sufficient to break the sacred bond of Christian fellowship. His public prayers were liberal and catholic, and he always showed the strongest affection for gospel ministers and true Christians of every name. In an unpublished letter to a noble lady of the Episcopal communion, he expresses his hope "that it will afford her a delightful satisfaction to observe how extensive and important the agreement, and how small the difference of religious sentiments, between a professedly staunch Presbyterian and a truly conscientious Episcopalian, if they both cordially believe the doctrine of God's free grace reigning to men's eternal life, through the imputed righteousness of Jesus Christ our Lord." He made a point of regularly attending and acting in the church courts, though he avoided taking any leading part in the management of ecclesiastical business. The uniformity and universality of his habits of personal devotion were remarkable. Of him it might well be said that he walked with God, and that in God he, as it were, to his own consciousness, lived, and moved, and had his being. The extent of his pecuniary liberality was surprising. He considered it a binding duty on every individual to devote at least a tenth part of his revenue to pious uses; and out of an income which, during the greater part of his life, amounted to only forty pounds a year, and never exceeded fifty, and from which he had a numerous family to support, he generally exceeded that proportion. He distributed his benevolence with strict attention to the Saviour's command, "Let not thy left hand know what thy right hand doeth."

He was aware of the importance of conversation among the various means of doing good, and, though he laments his own "sinful weakness and unskillfulness in pushing religious discourse," he was too conscientious to neglect the opportunities which presented themselves of promoting, in this way, the glory of God and the best interests of men. It is related that, having accidentally met Ferguson the poet walking in Haddington churchyard, and being struck with his pensive appearance, he modestly addressed him, and offered him certain serious advices, which deeply affected him at the time, and doubtless had their share in exciting and promoting those terrible convictions which latterly overwhelmed the poet's mind, and which it may perhaps be hoped there was something better than "the sorrow that worketh death." He knew, however, that there was a certain discretion to be used in such cases, and a selection to be made of the "*mollia tempora fandi*," the seasons when words are "fitly spoken." Of this the following anecdote is an example:—Having occasion to cross the ferry between Leith and Kinghorn, with a Highland gentleman as his fellow-passenger, he was much grieved to hear his companion frequently take the name of God in vain, but restrained himself from taking any notice of it in the presence of the rest of the company. On reaching land, however, observing the same gentleman walking alone upon the beach, he stepped up, and calmly reminded him of the offence he had been guilty of, and the law of God which forbids and condemns it. The gentleman received the reproof with expressions of thanks, and declared his resolu-

tion to attend to it in future. "But," added the choleric Celt, "had you spoken to me so in the boat, I believe I should have run you through."

It will not be supposed that, after having studied with such arduous in circumstances of comparative disadvantage, he neglected the more favourable opportunities he now enjoyed of extending and consolidating his knowledge. By a diligent improvement of the morning hours, and economy of time throughout the day, he rarely spent fewer than twelve hours of the twenty-four in his study. No degree of toil in the way of reading, or even of writing, seemed to daunt or to fatigue him. He transcribed most of his works several times with his own hand; and even without a view to the press, he more than once undertook the same fatigue for the convenience of private individuals. In this way, at the request of the Countess of Huntingdon, he copied out his *System of Divinity*, before its publication, for the use of her ladyship's theological seminary in Wales. He had remarkable facility in the acquisition of languages; and of this species of knowledge he possessed an extraordinary amount. Besides the three commonly called the learned tongues, he was acquainted with Arabic, Syriac, Persian, and Ethiopic; and of the modern languages, with the French, Spanish, Italian, Dutch, and German. In the various departments of *real* as distinguished from *verbal* knowledge, his reading was very wide in range and various in subject. His favourite pursuits were history and divinity; but every subject which more nearly or remotely bore on the literature of his profession, he considered worthy of his attention. He afterwards saw reason to repent of the wideness of his aims in this respect, and to regret "the precious time and talents," to use his own words, "he had vainly squandered in the mad attempt to become a universal scholar." His reading, though thus extensive, was at the same time very exact and accurate. In order to render it so, he in many cases adopted the tedious and laborious method of compiling regular abridgments of important and voluminous books. Among the works he thus epitomized, were Judge Blackstone's *Commentaries* and the *Ancient Universal History*.

In the month of September, 1753, about two years after his ordination, Mr. Brown married Miss Janet Thomson, daughter of Mr. John Thomson, merchant at Musselburgh. For eighteen years he enjoyed in her a "help meet" for him in his Christian course, and at the end of that period he surrendered her, as he himself expresses it, "to her first and better Husband." They had several children, of whom only two survived their mother—John and Ebenezer, both of whom their father had the satisfaction, before his death, of introducing as ministers into the church of Christ, the former at Whitburn, and the latter at Inverkeithing. Two years after the death of his first wife, which took place in 1771, he was married a second time to Miss Violet Crombie, daughter of Mr. William Crombie, merchant, Stenton, East Lothian, who survived him for more than thirty years, and by whom he left at his death four sons and two daughters. In his domestic economy and discipline, Mr. Brown laboured after a strict fidelity to his ordination vow, by which he promised to rule well in his own house. His notions in regard to the authority of a husband and a father were very high, and all the power which as such he thought himself to possess, was faithfully employed in maintaining both the form and the power of godliness.

In the year 1758 Mr. Brown, for the first time, appeared as an author. His first publication was entitled "*An Help for the Ignorant*, being an Essay

towards an Easy Explication of the Westminster Confession of Faith and Catechisms, compiled for the use of the Young Ones of his own Congregation." In addition to this he published, six years after, two short catechisms—one introductory to, the other explanatory of the Shorter Catechism. All these publications have been very extensively useful. In 1765 he published what was at the time by far the most popular and successful of his works, entitled *The Christian Journal, or Common Incidents Spiritual Instructors*. This work, though it has some of the literary defects which, on such a subject, might have been expected from an author so circumstanced, such as the occasional indulgence of unrefined images, the excess of detail in tracing the analogies, and a certain monotonous rhythm of style in many cases scarcely distinguishable from blank verse—nevertheless displays an extraordinary richness and ingenuity of fancy, and in many instances rises into a most impressive and heart-warming eloquence. In 1766 he published a *History of the Rise and Progress of the Secession*, and the year following, a series of *Letters on the Constitution, Discipline, and Government of the Christian Church*. These tracts were followed by his *Sacred Topology*, the first of a series of works which he designed for the purpose of giving a clear, comprehensive, and regular view of the figures, types, and predictions of Scripture. The second and third parts were published in 1781.

In the year 1768, in consequence of the death of the Rev. John Swanston of Kinross, professor of divinity under the Associate Synod, Mr. Brown was elected to the vacant chair. The duties of this important office he discharged with great ability and exemplary diligence and success. His public lectures were directed to the two main objects, first, of instructing his pupils in the science of Christianity, and secondly, of impressing their hearts with its power. The system of divinity which he was led, in the course of his professional duty, to compile, and which was afterwards published, is perhaps the one of all his works which exhibits most striking proofs of precision, discrimination, and enlargement of thought; and is altogether one of the most dense, and at the same time perspicuous, views which has yet been given of the theology of the Westminster Confession. He likewise, A.D. 1768, gave to the world one of the most elaborate, and certainly one of the most valuable of all his writings, *The Dictionary of the Holy Bible*. For popular use it is unquestionably the most suitable work of the kind which yet exists, containing the results of most extensive and various reading both in the science and in the literature of Christianity, given without pretension or parade, and with a uniform reference to practical utility. In 1771 the Honourable and Reverend Mr. Shirley, by command of the Countess of Huntingdon, applied to Mr. Brown for his opinions on the grand subject of justification, in view of a conference to be held on this question with Mr. Wesley and his preachers. This application gave occasion to a long and animated correspondence with that noble lady, and to a series of articles from his pen on the doctrine of justification, which appeared from time to time in the *Gospel Magazine* and *Theological Miscellany*, between the years 1770 and 1776. In the same year he was led, by a desire to contribute to the yet better instruction of his students, to form the design of composing a manual of church history on a general and comprehensive plan. It was to consist of three parts, "the first comprehending a general view of transactions relating to the church from the birth of our Saviour to the present time; the second containing more

fully the histories of the reformed British churches in England, Scotland, Ireland, and America; the third to comprehend the histories of the Waldenses and the Protestant churches of Switzerland, France, Holland, Germany, Denmark, Sweden, Poland, and Hungary." Of these he completed the two former, his *General History* having been published in 1771, and his *History of the British Churches* in the beginning of 1784. These form very useful popular compends, though destitute of high historical authority. The *History of the British Churches*, as a work of original research, is much superior to the more general compilation, which is little more than an abridgment of Mosheim, written in a more fervid spirit than the latter is accustomed to display. Mr. Brown's next publication appeared in 1775, and was an edition of the metrical *Psalms, with Notes exhibiting the Connection, explaining the Sense, and for directing and animating the Devotion*. In 1778 he gave to the world the great work on which his reputation is chiefly founded, *The Self-Interpreting Bible*, the object of which is to condense, within a manageable compass, all the information which an ordinary reader may find necessary for attaining an intelligent and practical knowledge of the sacred oracles. The first publication of this work was attended with considerable difficulties, in consequence of the claim of the king's printers to the exclusive right of printing the authorized version of the Scriptures, whether accompanied or not with illustrative matter. This claim, however, having been set aside, the work was at length given to the world in 1778, and received with a high and gradually increasing and still unexhausted approbation. The same year he published a small tract entitled *The Oracles of Christ Abominations of Antichrist*, and four years after, his *Letters on Toleration*: strenuously maintaining the unlawfulness of tolerating by authority a false religion in a professedly Christian country. These publications originated in the universal sentiment of alarm entertained by the evangelical Presbyterians of Scotland, both within and without the Establishment, in consequence of the proposed abolition of the penal code against the Roman Catholics.

In 1781, besides his works on the types and prophecies formerly referred to, he published a sermon on the *Duty of Raising up Spiritual Children unto Christ*, preached partly at Whitburn, and partly after his son Ebenezer's ordination at Inverkeithing. He likewise, in the course of the same year, wrote a pamphlet in defence of the re-exhibition of the testimony, and a collection of the biographies of eminent divines, under the name of the *Christian Student and Pastor*. This was the first of a series of similar compilations intended as illustrations and examples of practical religion, and was followed in 1781 by the *Young Christian*, and in 1783 by the *Lives of thirteen Eminent Private Christians*. In 1783 he published a small *Concordance to the Bible*. The year following he received an invitation from the reformed Dutch church in America, to become their professor of divinity, which he declined, and modestly kept secret. And, in 1785, he concluded his career as an author, by a pamphlet against the travelling of the mail on the Lord's-day—a day for the observance of which, in the strictest degree of sanctity, he always showed himself peculiarly jealous, not only abstaining himself, but prohibiting his family, from speaking on that day on any worldly affair, even on such as related to what may be called the secularities of religion and the church. The tracts published by him in periodical works, along with his *Letters on Gospel Preaching and the Behav-*

our of Ministers, were collected after his death, and published under the title of *Remains*.

Throughout his writings Mr. Brown's uniform aim was general utility; personal emolument formed no part of his object, and certainly very little of his attainment, as the whole profit accruing to himself from his voluminous, and in many cases successful, works, amounted to only £40. Without possessing much original genius, but on the other hand too ready, it may be, to submit the freedom of his mind to system and authority, he was endowed with a strong aptitude for acquisition, and great power of arrangement, a sound and generally sober judgment, and a rich and vivid fancy, though united with a defective, or rather, perhaps, an uncultivated taste. The selection of subjects, and general conception of almost every one of them, are very happy, and in many cases the execution proves his high endowments for the task he undertook.

The time now drew near that he should die. For some years previous he had been greatly annoyed with a gradual failure, at once in the bodily power of digestion and the mental faculty of memory—the symptoms of a constitution fairly worn out by the intense and incessant labours to which it had been subjected. In the beginning of 1787 his complaints increased in such an alarming degree, accompanied by a general and extreme debility, that he found it necessary to abandon the pulpit. During the months of spring, he lived in a continual state of earnest and active preparation for the great change he was about to undergo. He expired on the 19th June, and on the 24th his remains were followed to their place of repose in Haddington churchyard by nearly the whole inhabitants of the town, and a large concourse of his friends and brethren from a distance. At the first meeting of the Associate Synod after his decease, "the Synod," as their minute bears, "unanimously agreed to take this opportunity of testifying their respect to the memory of the Rev. John Brown, their late professor, whose eminent piety, fervent zeal, extensive charity, and unwearied diligence in promoting the interests of religion, will be long remembered by this court, especially by those members of it who had the happiness of studying divinity under his inspection."

BROWN, JOHN, M.D., founder of what is termed the Brunonian system in medicine, and one of the most eccentric and extraordinary men of his time, was a native of the parish of Bunkle, in Berwickshire, where he was born in the year 1735, or, as others assert, in 1737. Though only the son of a day-labourer, he contrived to obtain an excellent classical education at the school of Dunse, which was then taught by Mr. William Cruickshank, one of the most celebrated teachers that Scotland has produced. The genius and application of Brown were alike so great, that, at an age when the most of children are only beginning their letters, he was far advanced in a knowledge of Latin. His studies, after some time, were broken off in consequence of the inability of his father to maintain him at school. He was bound apprentice to the gloomy and monotonous craft of a weaver, which must have been peculiarly unsuitable to his lively faculties. However, he seems to have afterwards been enabled, by the kindness of his teacher, to renew his studies; and it is known that for this purpose he had employed himself on the harvest-field. His proficiency in Latin recommended him, first to the situation of usher in the school, and afterwards to that of tutor in a neighbouring family. When about twenty years of age he removed to Edinburgh, and, enter-

ing the university, advanced so far in the study of divinity, as to deliver a discourse preparatory to commencing his trials before the presbytery. Brown, however, was not destined to be a member of the clerical profession. Owing to some unexplained freak of feeling, he turned back from the very threshold, and for some years supported himself in the humble capacity of a *grinder* in the university. His services in this capacity to the medical students introduced him to a knowledge of medicine, which he suddenly resolved to prosecute as a profession. His natural ardour of mind enabled him very speedily to master the necessary studies, in which he was greatly assisted by the particular kindness and attention of Dr. Cullen, then professor of medicine in the university. At one period he acted as Latin secretary to this great man, with whom he afterwards quarrelled in the most violent manner. In 1765 he married, and set up a house for the purpose of receiving medical students as boarders. But his irregular and improvident conduct reduced him to bankruptcy in the short space of two years. A vacancy occurring in the high-school, he became a candidate; but being too proud of his real qualifications to think any other recommendation necessary, he was overlooked in favour of some child of patronage. It is said that, when his name, and his name alone, was presented to the eyes of the magistrates, they derisively asked who he was; to which Cullen, then separated in affection from his former pupil, is stated to have answered, with some real or affected hesitation—"Why, sure, this can never be our Jock!" Brown met with a similar repulse on applying for the chair of theoretical medicine in the university. Yet, notwithstanding every discouragement from the great men of his own profession, this eccentric genius was pressing on towards the completion of that peculiar system by which his name has been distinguished. His views were given to the world, in 1780, under the title *Elementa Medicinæ*; and he illustrated them further by lectures, which were attended, as a supernumerary course, by many of the regular students of the university. The Brunonian system simply consisted in the administration of a course of stimulants, instead of the so-called antiphlogistic remedies, as a means of producing that change in the system which is necessary to work a cure. The idea was perhaps suggested by his own habits of life, which were unfortunately so very disolute as to deprive him of all personal respect. He was, perhaps, the only great drinker who ever exulted in that degrading vice, as justified by philosophical principles. So far from concealing his practices, he used to keep a bottle of whisky, and another of laudanum, upon the table before him; and, throughout the course of the lecture, he seldom took fewer than three or four doses from each. In truth, Brown lived at a time when men of genius did not conceive it to be appropriate to their reputation as such, to conduct themselves with decency. Thus, a man who might have adorned the highest walks of society by his many brilliant qualities, was only fit for the company of the lowest and most despicable characters. He was a devout free-mason, but more for the sake of the conviviality to which it affords so fatal an excuse, than for the more condite and mysterious attractions (if any such exist) of the fraternity. He was the founder of a peculiar lodge in Edinburgh, called the "Roman Eagle," where no language but Latin was allowed to be spoken. One of his friends remarked with astonishment the readiness with which he could translate the technicalities and slang of masonry into this language, which, however, he at all times spoke with

the same fluency as his vernacular Scotch. It affords a lamentable view of the state of literary society in Edinburgh between the years 1780 and 1790, that this learned lodge was perhaps characterized by a deeper system of debauch than any other. In 1786 Brown removed to London, in order to push his fortune as a lecturer on his own system of medicine, which had already acquired no little fame. But the irregularity of his conduct, and the irascibility of his temperament, rendered all his hopes fruitless. He died at London, October 7, 1788, of a fit of apoplexy, being then little more than fifty years of age. His works have been collected and published by his son; but, like the system which they explain, they are now forgotten.

BROWN, JOHN, an ingenious artist, was the son of Samuel Brown, goldsmith and watchmaker at Edinburgh, where he was born in 1752. He received an excellent education, after the fashion of Scotland, and was early destined to take up the profession of a painter. Having formed a school friendship of no ordinary warmth with Mr. David Erskine, son of Thomas Erskine of Cambo, he travelled with that young gentleman in 1774 into Italy, where he was kindly received by Charles Erskine of the Rota, an eminent lawyer and prelate, the cousin of his companion. He immediately attached himself to the academy, with a resolution to devote himself entirely to the arts. During the course of ten years' residence in Italy, the pencil and crayon were ever in his hand, and the sublime thoughts of Raphael and Michael Angelo ever in his imagination. By continual practice he obtained an elegance and correctness of contour never equalled by any British artist; but he unfortunately neglected the mechanism of the pallet till his taste was so refined, that Titian, and Morillo, and Corregio made his heart sink within him whenever he touched the canvas. When he attempted to lay in his colours, the admirable correctness of his contour was lost, and he had never self-sufficiency to persevere till it should be recovered in that tender evanescent outline which is so difficult to be attained even by the most eminent painters. He wished everything important to be made out, and when it was made out, he found his work hard and disagreeable, like the first pictures painted by Raphael, and by all that preceded that wonderful artist. Brown, besides his genius for painting, possessed a high taste for music. His evenings in Italy were spent at the opera, and he penetrated deeply into the study of music as a science.

At Rome Brown met with Sir William Young and Mr. Townley, who, pleased with some of his pen-and-ink sketches, engaged him to accompany them to Sicily as a draughtsman. Of the antiquities of this island he took several very fine views in pen and ink, exquisitely finished, yet still preserving the character and spirit of the buildings he intended to represent.

It was the belief of one of Brown's Scottish patrons, that if he had gone to Berlin, he would have obtained the favour of Frederick the Great, on account of his extraordinary talents and refined personal character. A pious regard, however, for his parents, induced him to return to his native city, where, though universally beloved and admired, he found no proper field for the exertion of his abilities. Amongst the few persons of taste who patronized him was Lord Monboddo, who, with that liberality by which he was distinguished, gave him a general invitation to his elegant and convivial table, and employed him in making several pencil-drawings.

He was also employed to draw pencil-heads of fifty of the more distinguished members of the Scottish Society of Antiquaries, then just established; of which he finished about twenty. Among other works which he produced at Edinburgh, were heads of Dr. Blair, Sir Alexander Dick of Prestonfield, Runciman, his friend and brother artist, Drs. Cullen and Black, all of which were done in the most happy and characteristic manner. His talent in this line is described as having been very great. Amidst the collection which he had brought home to Edinburgh, was a portrait of the celebrated Piranesi, who, being unable to sit two moments in one posture, reduced his painter to the necessity of shooting him flying like a bat or snipe. This *rara avis* was brought down by Brown at the first shot.

In 1786 Brown was induced to remove to London in order to prosecute, on a larger field, his profession as a portrait-draughtsman in black lead. He was here occasionally employed by Mr. Townley in drawing from his collection of Greek statues, a branch of art in which Brown is allowed to have greatly excelled. After some time spent in unremitting application, his health gave way, and he was recommended to try the benefit of a visit to his native country, by sea. On his passage from London to Leith, he was somehow neglected as he lay sick in his hammock, and, on his arrival, he was found at the point of death. With much difficulty he was brought up to town, and laid on the bed of his friend Runciman, who had died not long before in the same place. Here he expired, September 5, 1787, having only attained the age of thirty-five.

BROWN, REV. JOHN, D.D. This learned and profound expositor of theology and eloquent preacher, was the son of the Rev. John Brown, Secession minister of Whitburn, and grandson of the distinguished John Brown, Secession minister of Haddington, of whom a notice has been already given. The subject of the present memoir was born in the parish of Whitburn, county of Linlithgow, on the 12th of July, 1784. Even when a boy his devout disposition, his love of reading and contemplation, and the distinction which his father, and still more his grandfather, had obtained as clergymen, had their natural influence in his choice of a profession; and having decided for the church, John, after the usual education at the parish school of Whitburn, was sent, at the age of thirteen, to the university of Edinburgh, where he underwent the usual *curriculum* to qualify himself for the ministry. It was an early age at which to follow out the necessary studies of literature and philosophy; but that he was already competent for such an attempt was thus attested by the learned Principal Lee, sixty years afterwards:—"I had the happiness of becoming acquainted with Dr. Brown in the year 1800. By that time I believe he was sixteen years of age, and had been three years at college. I had been six years a student, and had not the reputation of being idle; but well do I remember how strongly I was impressed with the proofs which he exhibited of great maturity of intellect, and remarkable power of giving expression to his thoughts in clear and felicitous language, more attractive to my somewhat fastidious taste than even the kind enchantment of his winning smile, and the lustre of his speaking eyes. Pleasing as his aspect was, and cheerful as was his conversation, it required no great amount of penetration to perceive that the amenity of his manner, and his other engaging accomplishments, were all subordinate to the love of truth and soberness, the earnest pursuit of solid and spiritual knowledge, the admiration of things

superlatively excellent, and the ascendancy of Christian principle exercised in labours of love."

Having finished his course of languages and philosophy at the university, John Brown, in 1800, after an examination by the Burgher presbytery of Perth, as to his character and attainments, commenced the study of theology in the divinity hall of the Secession church, under the care of its professor, the Rev. Dr. Lawson of Selkirk. These courses of instruction, which lasted only a few weeks during each session, he attended until 1804; the rest of his time was occupied in teaching a school in the village of Elie, Fifeshire, where he continued three years. It was a partial and defective mode of theological instruction, that could do little more than point out to the pupil what it was necessary for him to learn, and how to set about it, while all beyond was left to his own diligence and conscientiousness. The chances, also, of diligent theological study were still fewer, if to these were added the laborious and monotonous daily duties of a schoolmaster, which afford so little opportunity or inclination for long-sustained study. Thus it happened that although Brown's proficiency in the several branches of divinity were above the general average, his superiority for the present chiefly consisted in his knowledge of general literature and poetry, those departments that require less application, and are more easily mastered by desultory efforts. It was only when he became a minister, and had commenced the work of his sacred calling in earnest, that he was in training to become what the church finally acknowledged him to be—a most able theological commentator and expositor.

Having finished the prescribed course of study, the subject of this memoir was licensed as a preacher on the 12th of February, 1805, although he had not as yet completed his twenty-first year; and only a few weeks after, he had calls from two congregations to be their minister. The one was in the town of Stirling, the other in the obscure village of Biggar; but to the latter and more humble field he wisely gave the preference, by which he secured those opportunities for study and self-improvement which had hitherto been too circumscribed. On the 6th of February, 1806, he was ordained minister of the Secession church of Biggar, which contained a congregation of 300 members, and in this lowly sphere he commenced those elaborate and eloquent sermons which in future years were to be so greatly admired in the Scottish metropolis. His whole heart, as well as his closest study, during the seventeen years of his stay in this charge, were as fully occupied as if his preparations had been made for the pulpit of a cathedral, while his studies went onward until they had extended over the entire field of theology. In this way the young poetical and sentimental student became a painstaking, systematic, and erudite theologian and divine. Nor were the popular graces of his oratory of small account in his Sabbath public ministrations. His figure was graceful, and his countenance so handsome that it might have been termed feminine, but for its intellectual brow, and classical statuesque features; and while his voice was clear, musical, and distinct, so that every syllable fell into the ears of his auditory, his impassioned manner, when he had reached the height of his argument, compelled them to sympathize in his earnestness, and commit themselves to his guidance. These qualities could not but tell, even in an obscure nook of the upper ward of Lanarkshire. His little congregation was increased by hearers from the neighbouring parishes, until the church was too small to hold them, so that another had to be erected. Many of his audience also consisted, not of dissenters, but

members of the Establishment, who became his regular hearers, but without joining his church as communicants. And not limiting himself to the usual round of public duties, Mr. Brown preached not only on Sabbath evenings, but also during the week, and in barns, in school-rooms, and, when the weather permitted, in the open-air; using on such occasions not loosely studied or extemporaneous addresses, but the choicest of his composed sermons. Such a proceeding, and the crowds which these ministrations collected, roused the indignation of the moderate clergy of the Establishment; and loud was their outcry that he was a recruiting sergeant beating up for recruits to the Secession. It was, however, a groundless charge, for with a liberality rare at that time among our Scottish dissenters, he did not insist that members of the Establishment should forsake their church, as a condition of their sitting down at the sacramental table with his own people. On this occasion he carried out the long-forgotten principles of free communion so liberally expressed in the Westminster standards. While Mr. Brown was thus zealously employed as a minister, catechist, and evangelist, and by a course of patient laborious study improving not only his people but himself also, and becoming not merely a distinguished and useful minister and preacher, but also a profound scholar in theology, his sphere of exertion was always continuing to widen with his increasing power of action. The missionary spirit, which was still languid in Scotland, he succeeded in stimulating among his flock at Biggar, so that their contributions for missions at length arose to £100 per annum—a liberality at that time unwonted in a rural congregation. Another scheme he started which was wholly new in the Secession, was the establishment of a minister's library, designed to be the property of the congregation, but under the charge of the minister, and subservient to his improvement. The advantage, and even the necessity, of such an institution, will be perceived by those who consider the scanty stipend of country ministers in the Secession, and their remoteness from the means of intellectual improvement. This library, commenced in the congregation of Biggar, was adopted so cordially, that in the course of eight years the collection accumulated to 143 volumes, many of them expensive quartos and folios, which the funds of the minister alone could never have reached. A plan so happy, however, was confined to this country congregation until 1852, when its usefulness being fully appreciated, it was adopted by other churches of the Secession, until 150 ministers' libraries had been established upon rules similar to those of the parent institution of Biggar. Amidst such training, it would have been singular if his pen had continued to be confined to the preparations for a country pulpit, which was so well fitted for a wider and more ambitious sphere; and that Mr. Brown should become an author was nothing more than a natural consequence. The occasion arrived in 1814, when the Unitarian controversy was at its height in Glasgow, between Mr. Yates and Dr. Wardlaw, and when the former had published his reply to the latter under the title of *A Vindication of Unitarianism*. Mr. Brown had been engaged to review this vindication in the *Edinburgh Christian Instructor*; but finding the article too copious for insertion in the magazine, Dr. Andrew Thomson, its distinguished editor, advised Mr. Brown to publish his critique as a separate work. This the latter did in a pamphlet of seventy octavo pages, under the title of *Strictures on Mr. Yates's Vindication of Unitarianism*. Happily these *Strictures* were almost wholly unnecessary, as the controversy itself

died out, with the speedy decline of Unitarianism in Scotland, but not until the controversial learning, trenchant logic, and clear impressive forcible style of Brown's pamphlet had been recognized and acknowledged. On the following year (1816) he became editor of a new periodical, *The Christian Repository and Religious Register*, intended to defend the principles of dissent, and of this periodical Mr. Brown held the editorship for five years, until it was united with *The Christian Monitor*, a new periodical conducted by the Antiburgher Secession. Of this last periodical Mr. Brown also continued editor until 1826. As such an office, however, was too limited for his intellectual energies, he continued to issue separate writings from the press, of which the following is a brief summary:—In 1816 he published a volume of discourses suited to the dispensation of the Lord's supper, discussing the nature of that sacred ordinance in its doctrinal and practical aspects. A year afterwards, he republished two of his articles contributed to the *Christian Repository* on the plans and publications of Robert Owen of New Lanark, upon which he brought such an amount of moral and political philosophy to bear, as might have sufficed to crush the system, and convince the originator of his errors, had that wayward genius been in any way open to conviction. In 1818 he republished in a separate and improved form, three discourses which he had originally contributed to the *Edinburgh Christian Instructor*, on "The Character, Duty, and Danger of those who Forget God." A far more important work which he published during the same year, was *On Religion and the Means of its Attainment*. In this little treatise he endeavoured to emancipate the subject from the artificial language of systems, and explain it in terms sufficiently intelligible. The contents of the work are thus briefly summed up by his biographer:—"Religion is defined to be right thinking, right feeling, and right action towards God; and this scheme, adapted to the most elementary divisions of the powers of human nature, is shown to include the whole of religion in general, and of Christian piety in particular. The grand means necessary, and yet effectual, of becoming thus religious, is faith; and this is neither more nor less than the belief—in the ordinary sense of the word—of the contents of revelation, since this secures right thinking, and by a necessary law of dependence, right feeling and action. Faith again is produced by the study of the meaning and the evidence of the truth which is set forth to be believed; and the inveterate disinclination of man to enter on and pursue this study, which is the only hindrance to religion, is overcome by the influence of the Holy Spirit." While the authorship of Mr. Brown was employed upon these subjects of general religious interest, he did not forget the claims of missionary enterprise, and these sermons which he preached in support of foreign and home missions appeared at intervals from the press. The first was *On the Danger of Opposing Christianity, and the Certainty of its Final Triumph*. The second was *On the Duty of Pecuniary Contribution for Religious Purposes*. The third, which had especial regard to the evangelization of the Highlands, was entitled, *On the State of Scotland in Reference to the Means of Religious Instruction*.

It was impossible that such an obscure locality as Biggar could long retain a minister who was rising to distinction in the Secession church. It was seen that such talents were fitted for a wider sphere of usefulness, and accordingly, in 1817, Mr. Brown received a call from a newly-formed congregation in North Leith to become their minister, with which,

however, he did not judge it fit to comply. Another call in 1822, from a congregation in Rose Street, Edinburgh, was more successful, and to this important ministerial charge he was translated after parting from his old flock with affectionate regret. The change came at the right time, as he was now in the thirty-eighth year of his age, in the full vigour of his intellectual faculties, and the field into which he entered was well fitted to task his previous training and experience to the uttermost. Not only the metropolitan pulpit, but the bar, possessed such eloquence and talent as no former period had witnessed; and no secondary excellence was needful to enable a dissenting minister to rise to distinction, or even to hold his own amidst such a formidable competition. But Mr. Brown stood the test and was successful; his weighty, well-studied sermons were winged with an eloquence and fervour that carried them to the hearts not only of general hearers, but of the learned and accomplished; and Rose Street church, which was a large building little more than half filled, was soon crowded to overflowing. And it was no mere ephemeral popularity which thus welcomed his entrance into Edinburgh, but a lasting esteem that continued to the close, and the following description, given by one of his hearers, will apply to every Sabbath of his pulpit appearances:—"I can well remember with hundreds then children, but now advancing in life, that though not able to comprehend the exact meaning of Mr. Brown's discourses, we used to walk in company, with the sanction of our parents, to a considerable distance, when it was known that Mr. Brown of Biggar was to preach in some country meeting-house, to enjoy the great luxury of at least seeing that never-to-be-forgotten face, and hearing the musical tones of his voice. From the time that he preached his induction sermon in Rose Street church, to the hour of his death, it was my unspeakable delight to sit under his ministry, and enjoy much of his personal friendship. The character of the attendance, from first to last, both at home and abroad, both in his early and later years, was such as to testify the high estimate formed of his pulpit services, and carries the mind back to kindred scenes witnessed in the early history of our church. On a Sabbath-day, between sermons, I have seen groups of intelligent working people speaking earnestly together of the impressive truths uttered by him in the morning, and waiting anxiously for the afternoon or evening service; and then the crowds were so dense, that he was frequently led from the session-house to the pulpit, hand to hand across the tops of the pews."

While such was the character, and such the effects, of Mr. Brown's preaching, his Sabbath ministrations were accompanied with an amount and variety of every-day duties, which of themselves would have been sufficient for any ordinary man. They were, however, diligently performed, while additional tasks of a more indirect and fortuitous character, but perhaps not less necessary and useful, were cheerfully undertaken and successfully carried through. These chiefly referred to home and foreign religious missions, the gratuitous instruction of young students in training for the ministry, and the defence of Christian truth against its numerous assailants whether within the church or without. The Scottish church, in all its forms, especially demands a working clergy, and it is in Edinburgh that their work is most abundant. But amidst all this multiplicity of toil, Mr. Brown continued to be a diligent student: in manhood and old age, and onward to the close of life, he was always seeking to perfect what he had already learned, or acquire something new, while

every fresh attainment was made subservient to his favourite investigations in theology. In 1829 he was transferred from his church in Rose Street to that of Broughton Place, and while the change filled this large building with a regular audience, the number of members, which at first was 600, rose to 1200. In the autumn of 1830 he had the degree of D.D. conferred upon him by Jefferson College, Pennsylvania. In 1834 he was elected to the chair of exegetical theology in the Secession church, and thus, in addition to his pastoral duties, the training of students for the ministry was devolved upon him. The importance of such a charge may be surmised from the fact, that during the twenty-four annual sessions, over which his tenure of office extended, not much less than a thousand students had passed under his hands. How well he was qualified for the office, the nature of his library, and his mastery of its contents, was one of many proofs. It contained several thousand volumes, many of them being rare and valuable, and all of them select and useful—the accumulation of a life-time, and purchased from a scanty revenue—and with these he was so well acquainted, that he could give an analysis of every book in the collection. When the Voluntary Controversy commenced, Dr. Brown, as might be expected, coincided with his dissenting brethren; and when the Disruption occurred, by which the Church of Scotland was rent, and a new secession established still greater than the first, Dr. Brown watched every step of the movement with deep interest. Another subject of interest, which involved him in controversy, was the Edinburgh annuity tax for the support of the city clergy of the Establishment. This impost, in common with many of the Edinburgh dissenters, he refused to pay upon the plea of conscience; and to justify his refusal, he published two lectures on the subject, which by subsequent additions were expanded into a goodly volume. Independently of the popularity of this work among dissenters in general, its abstract merits were so great, that Lord Brougham thus wrote of it: "I have never seen the subject of civil obedience and resistance so clearly and satisfactorily discussed." But not content with a simple protest, Dr. Brown was ready to endure those legal penalties with which non-payment of the tax was visited; and once and again his household goods were distrained and sold by the civic authorities, in consequence of his refusal to pay the tax. It was a painful predicament in which to stand, which fortunately, however, did not long continue, for in consequence of domestic changes, unconnected with this impost, he found it necessary to remove beyond the boundaries of the royalty of Edinburgh, where the annuity tax had no hold. But a more painful subject was the "atonement controversy," which arose in the Secession itself, into which Dr. Brown was compelled to enter, and that lasted during five years of keen and vexatious debate, in the course of which he was charged by the opposite party with having advocated heterodox and unscriptural sentiments. The doctor appealed to the Synod and demanded a trial, the result of which was a complete acquittal, while his congregation expressed their confidence in him as a teacher of sound doctrine by a gift of £200, and other tokens of affection, when the trial had ended.

A colleague having been appointed to him in 1842, and the vexatious atonement controversy having closed in 1845, Dr. Brown had leisure for a return to that kind of theological authorship by which his reputation, as well as usefulness, was the most permanently insured. In 1848 he published, in three volumes, his *Expository Discourses on the First*

Epistle of the Apostle Peter. These discourses had been preached to his congregation, at intervals, during a period of sixteen years, and were now published at their urgent request. Being delivered in the form of lectures, fashioned upon the old Scottish model, they may be properly considered as a commentary, where the critical and analytical learning is subordinated to the popular intelligence and practical bearing of the expositions. The work was favourably received both in Britain and America, and in scholarship alone it rivalled the best commentaries of the German school of theology, with a more sound and practical character than they can generally lay claim to. His next work of importance, also in three volumes, having for its title, *Discourses and Sayings of our Lord Jesus Christ, Illustrated in a Series of Expositions*, appeared in 1850. His chief aim in this publication, for the illustration of which hundreds of volumes in various languages had been consulted, was to show the pre-eminent place which the person of Jesus holds in the Christian faith, as opposed to the rationalists of the age. "A personal deity," he writes, "is the soul of natural religion; a personal Saviour, the real living Christ, is the soul of revealed religion. How strange that it should not be impossible—how sad, that through a perverted ingenuity it should not be uncommon—in reference to both of these, to convert that into a veil which was meant to be a revelation." As a sequel to his *Discourses and Sayings of our Lord*, Dr. Brown, in 1850, published *An Exposition of our Lord's Intercessory Prayer*, in one volume. His next work, which appeared in 1851, was entitled "*The Resurrection of Life*, being an exposition in one volume of 1 Cor. xv." In 1852 he published his work called *The Sufferings and Glories of the Messiah*, and in 1853 appeared his *Exposition of the Epistle to the Galatians*. This work, dedicated to the ministers, preachers, and students who had studied exegetical theology under his care, although comprised in a single unpretending volume, was one of the most carefully laboured of his writings, 114 critical and hermeneutical treatises having been consulted in the course of its preparation.

As the preceding works, although comprising ten volumes, had been published within little more than five years, it was time that their author should rest, and accordingly three years elapsed before he resumed his pen. He then, towards the close of 1856, and when he was seventy-two years old, published his work entitled *Parting Counsels*, being an exposition of 2 Pet. i., to which were added some other discourses of public interest. In the following year, he published his *Analytical Exposition of the Epistle of Paul to the Romans*, a subject which had exercised his mind for more than forty years, and upon which a vast amount of learning was concentrated. He intended to have produced upon this portion of Scripture an extensive commentary, but feeling the effects of old age, and the approach of death, was compelled to forego his design. In stating this, he adds, "Yet I am unwilling to go hence, without leaving some traces of the labour I have bestowed on this master-work of the apostle; without contributing some assistance, however limited, toward the production of what, whenever produced, will mark an era in the history of Scriptural exegesis,—a complete exposition of the Epistle to the Romans. Forbidden to build the temple, I would yet do what I can to furnish materials to him who shall be honoured to raise it." His contribution in this case was a valuable volume of more than 600 pages. One work yet remained, an *Exposition of the Epistle to the Hebrews*, which he had prepared for the press, but did not live to publish.

While the last years of Dr. Brown were thus spent in a round of ceaseless activity, in which the duties of minister, professor, and author were so faithfully discharged, the esteem which he had won from the world at large was emphatically expressed when the fiftieth anniversary of his ministry had arrived. This was on the 6th of February, 1856, and on the 8th of April the event was celebrated as a religious jubilee in his church of Broughton Place, and in the evening in Tanfield hall. The addresses delivered by the chief ministers of his own and other religious denominations bore striking testimony to his worth and the high appreciation of his character, while not the least eloquent was a gift of £610 presented to him by his congregation as a token of their esteem and gratitude. Although Dr. Brown had never at any time been rich, he devoted the whole of this sum, with an additional donation of £50 from his own pocket, towards the formation of a fund for the relief of aged and impoverished ministers. In 1857 his increasing debility obliged him to resign his professorship, and in the following year his ministerial charge, after which he patiently awaited that solemn change from time to eternity for which his whole life had been a preparation. On the 13th of October, 1858, he passed away so gently that it seemed the tranquil act of falling asleep, after he had expressed his joyful hopes of immortality, and bid his sorrowing friends farewell. A week after, his remains were interred in the New Calton burying-ground; and the funeral, which was attended by ministers of various denominations, and a concourse of mourners as such an occasion had never collected in Edinburgh, showed the public sense of such a bereavement.

The character of Dr. Brown—his acquirements and accomplishments as a minister, professor, scholar, and Christian expositor—can be but faintly understood from this brief sketch of his history. His eloquence survives, but only in the memory of the living, while his authorship was of a kind that requires whole years fully to appreciate. But it will stand the test, and on that account will only be the more lasting. It is only necessary to add to this memoir, that Dr. Brown was twice married. His first wife was Miss Jane Nimmo of Glasgow, who died in May, 1816. His second wife was Margaret Fisher Crum, daughter of Alexander Crum, Esq., of Thornliebank, near Glasgow, whom he married after a widowhood of nineteen years, and who died in 1841.

BROWN, ROBERT, D.C.L. This eminent botanist, whom his friend Baron Humboldt characterized as the "botanicorum facile princeps," was the son of a Scottish Episcopalian minister, and was born at Montrose on the 21st of December, 1773. His education was prosecuted first at the Marischal College, Aberdeen, and subsequently at the university of Edinburgh, where he finished his course of medical study in 1795, in which year he accompanied a fencible regiment to Ireland, in the double capacity of ensign and assistant-surgeon. Near the close of the eighteenth century he had returned to Edinburgh, where he published his first scientific paper on the Asclepiadæ in the *Transactions of the Wernerian Society*, and on the 20th of November, 1798, he was elected an associate of the Linnean Society of London.

The remarkable aptitude of Robert Brown for botany, and his proficiency in the science, had now secured for him the lasting friendship of Sir Joseph Banks, at whose recommendation he was attached in 1801 as naturalist to His Majesty's ship *Investigator*, then commissioned under the command of Captain

Flinders to make a survey of the coast of Australia. Relinquishing his medical and military commissions, Brown eagerly embarked on an enterprise where his favourite study would find such scope; and in the long exploration of the *Investigator* on the extensive coast of Australia, and its rocks, coral reefs, and shifting sandbanks, he zealously prosecuted his discoveries among the flora of this new continent, with the growing fame of which his name will henceforth be indelibly associated. He did not return to England until the end of 1805, bringing with him nearly 4000 species of plants, many of which had hitherto been unknown in botanical science, and an inexhaustible store of new ideas in relation to the characters, distribution, and affinities of the singular vegetation which distinguishes the continent of Australia from every other region. To arrange these specimens, to study them in their generalization and detail, and to publish the results of these labours, formed to Brown the work of his future years. But it was a labour of love, which he prosecuted with enthusiasm, and the world was compelled to recognize his superiority. Hitherto the system in natural science of Jussieu had been little known in England, or indeed in any country except France; but its adoption by Robert Brown—who was now accounted the first botanist of the age—and the modifications and improvements he introduced in it, made it be regarded as far superior to the Linnæan method, which it generally superseded.

On the return of Brown from his exploration, laden with the botanical treasures of Australia, his labours were rewarded by his being appointed librarian to the Linnæan Society. After the death of Dryander in 1810 he received the charge of the noble library and splendid collections of his friend, Sir Joseph Banks, who bequeathed to him their enjoyment for life, with the house in which these collections were contained, and an annuity of between £200 and £300 a year. At a later period these scientific treasures were transferred, with Brown's consent, to the British Museum, in which he was appointed keeper of botany. The public distinctions that were successively conferred upon him showed how highly his contributions to science were valued, and himself esteemed. In 1810 he was elected a Fellow of the Royal Society. He was a member of the Institute of France, and also of the Imperial L. C. Academy of Germany, and was enrolled as an honorary member in almost every minor society in all parts of the old and new world. He received during the administration of Sir Robert Peel a pension of £200 per annum in recognition of his merits and public services. From the university of Oxford, in 1832, he received the honorary degree of D.C.L., in company with Brewster, Dalton, and Faraday. In 1849 he became president to the Linnæan Society; and he was invested by the king of Prussia with the decoration of the highest Prussian civil order, *pour le mérite*, of which Humboldt was the chancellor.

As an author, Robert Brown did not produce bulky volumes; on the contrary, with two exceptions, they are independent communications published in the transactions of various societies, or in the appendix to narratives of scientific expeditions. In this form they would have been somewhat inaccessible to the general scientific public, had they not, up to the year 1834, been carefully collected by the late Dr. Nees von Essenbeck, president of the Imperial Leop. Carol. Academy of Germany, who published them in five octavo volumes, under the title of *Robert Brown's Vermischte Schriften*. The excellence of this collection, and the rich knowledge contained in the articles, will make every lover of botanical science regret that

the collection was not continued still farther onward, and made more complete. The mere headings of these articles suffice to show the universality of Brown's botanical knowledge. His first separate publication after his return to England, which appeared in 1810, was the first volume of his *Prodromus Floræ Novæ Hollandiæ et Insulæ Van Diemen*; but some unlucky critical remarks in the *Edinburgh Review* upon the classicity of his Latin made him withdraw the volume, so that it is chiefly known in Von Essenbeck's collection. In 1830, however, Brown seemed to think better of it, and issued a supplement to the *Prodromus*, the only one that ever appeared. His second great work, the *Plante Javaïques Kariories*, was published in conjunction with Dr. Horsfield and Mr. J. J. Bennett, and was completed within the years 1838 and 1852.

Thus silently, in contrast to his merits and the honourable recognition of those who could estimate them, the life of Robert Brown passed onward to the close. He was modest and shy of distinctions, so that he was eminently one of those who "have honour thrust upon them." But he had friends who understood and loved him well, and one of them, a distinguished contemporary, has thus delineated his personal worth: "Those who were admitted to the privilege of his intimacy, and who knew him as a man, will bear unanimous testimony to the unvarying simplicity, truthfulness, and benevolence of his character. With an appearance of shyness and reserve in the presence of strangers, he combined an open-heartedness in relation to his familiar friends, and a fund of agreeable humour, never bitter or caustic, but always appropriate to the occasion, the outpourings of which it was delightful to witness. But what distinguished him above all other traits was the singular uprightness of his judgment, which rendered him on all difficult occasions an invaluable counsellor to those who had the privilege of seeking his advice. How profoundly these admirable qualities had endeared him to the hearts of his friends was unmistakably manifested by the sympathetic tenderness with which his last hours were watched and soothed. With his faculties unclouded to the last, he died on the 10th instant [June, 1858], surrounded by his collections in the room which had formerly been the library of Sir Joseph Banks. 'It was in the year 1810,' says one of his distinguished friends, who contributed greatly to relieve the sufferings of his last illness, 'that I first became acquainted with Mr. Brown, within three feet of the same place, in the same room where I saw him so nearly drawing his last breath three days ago. He was the same simple-minded, kind-hearted man in November 1810 as he was in June 1858—nothing changed but as time changes us all.'"

BROWN, THOMAS, a distinguished modern philosophical writer, the son of the Rev. Samuel Brown, minister of the parish of Kirkcubrecht in the stewartry of Kirkcubright, was born at the manse of that parish, January 9, 1778. Deprived of his father when between one and two years old, Thomas Brown was removed to Edinburgh, where for some years he lived under the charge of his widowed mother. By her he was taught the elements of learning, at a singularly early age, acquiring the whole alphabet, it is said, by one effort, or to use other words, in one lesson, and everything else with the same amazing facility. When between four and five years of age, he was able to read the Scriptures, and also, it would appear, partly to understand them. One day, at that period of his life, he was found sitting on the floor of his mother's parlour, with a large family Bible on his knee, which he was

dividing into different parts with his hand: being asked jocularly if he intended to preach, and was now choosing a text, he said, "No, I am only wishing to see what the evangelists differ in; for they do not all give the same account of Christ." From the kindly tutelage of his mother he was removed in the seventh year of his age, and placed by his maternal uncle, Captain Smith, in a school at Camberwell, from which in a short time he was transferred to one at Chiswick, where he continued for some years. In these and two other academies he spent the years between seven and fourteen, and acquired a perfect classical education. In 1792 he returned to the maternal roof at Edinburgh, and commenced a course of attendance at the university. At this period of his life he was deeply read in English belles-lettres, and had even collected a considerable library, which, however, was lost at sea in its passage from England to Scotland. Having gone to Liverpool to spend the vacation of 1793 with some friends, he became, boy as he was, the intimate friend of Dr. Currie, the amiable biographer of Burns, who is believed to have been the earliest cause of his directing his mind to metaphysical studies, by placing in his hands the first volumes of Professor Dugald Stewart's *Elements of the Philosophy of the Human Mind*, then just published. The impressions he received from this work were deepened next winter, when he attended its author's lectures in the moral philosophy class at Edinburgh College. Yet, much as he admired Professor Stewart, he did not fail, even at the early age of sixteen, to detect that deficiency of analysis which often lurks under the majestically flowing veil of his language and imagery. According to the late Dr. Welsh, whose very pleasing memoir of Dr. Brown is here followed, the scholar took an early opportunity of presenting to his master a few remarks which he had thrown together in reference to one of his theories. "Those who remember the dignified demeanour of Mr. Stewart in his class, which was calculated to convey the idea of one of those great and gifted men who were seen among the groves of the academy, will duly appreciate the boldness of our young philosopher. With great modesty he read his observations; to which Mr. Stewart, with a candour that was to be expected from a philosopher, but which not the less on that account did him infinite honour, listened patiently, and then, with a smile of wonder and admiration, read to him a letter which he had received from the distinguished M. Prevost of Geneva, containing the same argument which Dr. Brown had stated." This delightful incident was the commencement of an acquaintance between the master and the pupil, which led to more intimate relations, and only ended with the death of Dr. Brown. The varied and profound acquisitions of this extraordinary young man, soon attracted to him the attention and friendship of many other personages, distinguished by academic rank and literary reputation, especially Professors Robison, Playfair, and Black, and Messrs. Horner, Leyden, Reddie, and Erskine. Ere he had completed his twentieth year, he was led, by the spirit of philosophical inquiry, to write *Observations upon Dr. Darwin's Zoonomia*, in a pamphlet that far surpassed the work which had called it forth. It appeared in 1798, and, while it excited astonishment in those who knew the years of the author, was received in other quarters as the work of a veteran in philosophy. Dr. Welsh justly characterizes it as one of the most remarkable exemplifications of premature intellect which has ever been exhibited, and states that, though unfortunate in its object, and the exposure of an unworthy production, it is found to contain the

germ of all Dr. Brown's subsequent discoveries as to mind, and of those principles of philosophizing by which he was guided in his future inquiries. Dr. Brown at this time belonged to an association of young men, which, whether from its peculiar object, the celebrity since acquired by several of its members, or one remarkable result of its existence, must be acknowledged as possessing no ordinary claims to attention. It was called the Academy of Physics, and its object is described in the minutes of its first meeting to have been, "the investigation of nature, the laws by which her phenomena are regulated, and the history of opinions concerning these laws." The first members were Messrs. Brougham, Erskine, Reddie, Brown, Rogerson, Birbeck, Logan, and Leyden; to whom were afterwards joined Lord Webb Seymour, the Rev. Sydney Smith, and Messrs. Horner, Jeffrey, and Gillespie. The Academy prosecuted its investigations with great assiduity and success for about three years; like many other clubs, the spirit in which it originated began to change with the changed years and altered views of its members; it flagged, failed, and was finally broken up. The remarkable result of its existence, above alluded to, was the establishment of the *Edinburgh Review*. The first writers in this work were Jeffrey, Brougham, Sydney Smith, Horner, and Brown. The leading article of the second number upon *Kant's Philosophy*, was by the last of these gentlemen. Mr. Brown, however, did not long continue to contribute; a misunderstanding with the gentleman who superintended the publication of the third number regarding some liberties taken with one of his articles, was the cause of his retirement.

Brown's first ideas as to a profession led him to choose the bar, and for a twelvemonth he prosecuted the dry studies of the law. An insurmountable repugnance, however, to this pursuit caused him afterwards to study medicine. He obtained his degree of M.D. in 1803, on which occasion he was honoured with the highest commendations from Dr. Gregory, not only for his proficiency in medical learning, but for the amazingly fluent and elegant style of his Latinity, of which no one could judge better than that learned professor, himself acknowledged to be the best Latinist of his time in Scotland. Previous to this period, namely in 1800, when he was only twenty-two years of age, his friends had, unsuccessfully, endeavoured to obtain for him the chair of rhetoric; but a system by which the clergy of the university seat were almost invariably preferred to the vacant chairs, blasted his hopes on this occasion. This disappointment, with his antipathy to the courtly party of the church, by which it was patronized, seems to have inspired him with a vehement aversion to a system which can only be palliated by a consideration of the narrow stipends then enjoyed by the clergy, and the prospect of enriching, by this oblique means, the prospects which were to induce men of abilities to enter the church. Upon the promotion of Mr. Playfair to the chair of natural philosophy, Mr. Leslie competed for the vacant chair of mathematics with a clergyman whose attainments in that study, though more than respectable, certainly could not be placed on an equality with those of the opposing candidate. The church party, knowing that they could not make out any superior qualifications in their candidate on the score of mathematics, endeavoured to produce the same effect by depreciating Mr. Leslie's qualifications on the score of religion. Their proflay in a note to Mr. Leslie's essay on heat, containing an expression of approbation respecting Hume's doctrine of causation. The canvas, which lay in the

town-council, was the cause of great excitement in the literary world, and for some time absorbed every other topic of discourse in Edinburgh. Dr. Brown was tempted by his feelings on this subject to come forward with an essay, disproving the inferences which were drawn from Mr. Leslie's note; an essay which, in a subsequent edition, he expanded into a complete treatise on cause and effect. Through the influence of this powerful appeal, and other similar expressions of public feeling, the patrons of the chair were shamed for once out of their usual practice, and Mr. Leslie received the appointment.

Dr. Brown had before this period published two volumes of miscellaneous poems, which, though they did not meet with brilliant success, are yet to be admired as the effusions of an ingenious and graceful mind. In 1803, immediately after receiving his diploma, he began to practise as a physician, and he had hitherto met with considerable success. He was now (1806) taken into partnership by Dr. Gregory, and for some time his attention was occupied more exclusively by his profession than was at all agreeable to one disposed like him to give up worldly advantages for the sake of a darling study. The prospect of an occupation more germane to his mind opened up to him in the winter of 1808-9, when the state of Mr. Stewart's health induced him to request the services of Mr. Brown as his temporary substitute. The lectures which he delivered in this capacity attracted much attention, on account of their marvellous display of profound and original thought, of copious reading, of matchless ingenuity, and of the most admirable elocution; this last accomplishment having been acquired by Dr. Brown in the ordinary course of his school studies. "The Moral Philosophy Class at this period presented a very striking aspect. It was not a crowd of youthful students led into transports of admiration by the ignorant enthusiasm of the moment; distinguished members of the bench, of the bar, and of the pulpit, were daily present to witness the powers of this rising philosopher. Some of the most eminent of the professors were to be seen mixing with the students, and Mr. Playfair, in particular, was present at every lecture. The originality, and depth, and eloquence of the lectures, had a very marked effect upon the young men attending the university, in leading them to metaphysical speculations."—(*Walsley's Memoir*.) The effect of these exhibitions was so great, that when Mr. Stewart, two years after, expressed a wish to have Dr. Brown officially conjoined to him in the chair of moral philosophy, the usual influence in favour of the clergy was overcome with little difficulty. From the commencement of the session of 1810-11, he acted as the substitute of Mr. Stewart, who now retired to the country; and, what is certainly very wonderful, he wrote the whole of his first course of lectures during the evenings which preceded the days on which they were delivered. After the first and most difficult step had been got over, Dr. Brown obtained a little leisure to cultivate that poetical vein which had all along been one of his own favourite exercises of thought; and accordingly, in 1814, he published his largest versified work, entitled *The Paradise of Coguettes*. As this poem appeared anonymously, its success, which was considerable, must have given him high gratification. He was, therefore, tempted next year to bring forth another under the title of *The Wanderer in Norway*.

The health of Dr. Brown had never been good; and it was now the annual custom of this amiable and gifted being to retire during the summer vacation to some sequestered and beautiful nook of his romantic native land, in order to enjoy the country

air and exercise. Sometimes he would plant himself in some Swiss-like spot, hanging between Highland and Lowland, such as the village of Logie in Glendevon. At other times he would lose himself in the woody solitudes of Dunkeld. He had all his life a fondness for romantic and rugged scenery, amidst which he would occasionally expose himself to considerable risks. Walking was his favourite exercise, as he was thus able to pause and admire a rock, a wild flower, a brook, or whatever else of the beautiful presented itself. To his gentle and affectionate disposition, one object always appealed with irresistible power—namely, a cottage smoking amidst trees: he never could pass a scene of that kind without pausing to ruminate upon the inexplicable sympathy which it seems to find in almost every breast. Though possessing a heart as open as daylight, the weakly health of Dr. Brown, and the abstraction of his studies, seem to have checked that exuberant feeling which assumes the form called love; it is the impression of one of his surviving friends that he never experienced that sensation, at least to any extent worthy of the name. His affections were devoted to his mother, his sisters, nature, books, studies, literary fame. He seemed to have none for "the sex." In 1817 his feelings sustained a dreadful shock in the death of the former relative, who had been his first instructress, and to whom he bore an affection bordering upon reverence. Her remains were first placed in a vault in Edinburgh; and at the end of the winter-session moved to the family burying-ground in the old churchyard of Kirkmabreck. This romantic and secluded spot Dr. Brown had always viewed with great interest. A few years before, in visiting his father's grave, he had been altogether overcome, and when he saw the earth closing in upon all that remained of a mother that was so dear to him, "and the long grassy mantle cover all," his distress was such as to affect every person who saw him. In 1818 Dr. Brown published a poetical tale, entitled *Agnes*. But his reputation in this walk of literature was not on the increase. His mind by no means wanted poetical feeling and imagery; but he never could prevent the philosopher from intruding upon his warmest visions, and accordingly there is a decided tameness in all his verses. It may be said, that, if he had not been a great philosopher, he would have been a greater poet; and, on the other hand, if he had not attempted poetry, at least his *living* reputation as a philosopher would have been somewhat enhanced.

Towards the end of 1819 the ill health of Dr. Brown began to assume an alarming aspect, and early in the ensuing year he found himself so weak as to be obliged to appoint a substitute to deliver his lectures. This substitute was Mr. John Stewart, another of the devotees of science, and, like himself, destined soon to sink prematurely beneath the weight of intellectual exertion. Of Brown it might truly be said, that an active spirit had worn out the slender and attenuated frame in which it was enshrined. At the recommendation of his physicians, he took a voyage to London, and established himself at Brompton, then a healthy village in the vicinity, but now involved in the spreading masses of the great city. Here he gradually grew weaker and weaker, until the 2d of April, when he gently breathed his last.

"Dr. Brown," says his reverend biographer, "was in height rather above the middle size, about five feet nine inches; his chest broad and round; his hair brown; his features regular; his forehead large and prominent; his eyes dark gray, well formed, with very long eye-lashes, which gave them a very soft and pleasing expression; his nose might be said to be

a mixture of the Roman and Grecian, and his mouth and chin bore a striking resemblance to those of the Buonaparte family. The expression of his countenance altogether was that of calm reflection. . . . His temper was remarkably good; so perfect was the command he had over it, that he was scarcely ever heard to say an unkind word. Whatever provocation he received, he always consulted the dignity of his own character, and never gave way to anger. Yet he never allowed any one to treat him with disrespect; and his pupils must remember the effect of a single look in producing, instantaneously, the most perfect silence in his class. . . . At a very early period, Dr. Brown formed those opinions in regard to government to which he adhered to the end of his life. Though he was not led to take any active part in politics, he felt the liveliest interest in the great questions of the day, and his zeal for the diffusion of knowledge and of liberal opinion, was not greater than his indignation at every attempt to impede it. The most perfect toleration of all liberal opinions, and an unshackled liberty of the press, were the two subjects in which he seemed to take the most interest, and which he seemed to consider as most essential to national happiness and prosperity. In his judgment upon every political question, he was determined solely by its bearings upon the welfare of the human race; and he was very far from uniformly approving of the measures of the party to which he was generally understood to belong. Indeed, he often said that liberty, in Scotland at least, suffered more from the Whigs than the Tories—in allusion to the departure he conceived to be sometimes made from professed principles with a view to present advantage. . . . He was intimately acquainted with the principles of almost all the fine arts, and in many of them showed that practice only was wanting to insure perfection in his powers of execution. His acquaintance with languages was great: French, Italian, and German he read with the same ease as English. He read also Spanish and Portuguese, though not so fluently. . . . Among the more prominent features of Dr. Brown's character, may be enumerated the greatest gentleness, and kindness, and delicacy of mind, united with the noblest independence of spirit; a generous admiration of everything affectionate or exalted in character; a manly contempt for everything mean; a detestation for everything that even bordered on tyranny and oppression; a truly British love of liberty, and the most ardent desire for the diffusion of knowledge, and happiness, and virtue, among mankind. In private life he was possessed of almost every quality which renders society delightful, and was indeed remarkable for nothing more than for the love of home and the happiness he shed around him there. It was ever his strongest wish to make every one who was with him happy; his exquisite delicacy of perception gave him a quick fore-feeling of whatever might be hurtful to any one; and his wit, his varied information, his classical taste, and, above all, his mild and gentlemanly manners, and his truly philosophic evenness of temper, diffused around him the purest and most refined enjoyment. Of almost universal knowledge, acquired by the most extensive reading, and by wide intercourse with the world, there was no topic of conversation to which he seemed a stranger. . . . In the philosophic love of truth, and in the patient investigation of it, Dr. Brown may be pronounced as at least equal, and in subtlety of intellect and power of analysis, as superior to any metaphysician that ever existed. The predominating quality in his intellectual character was unquestionably his power of analyzing, the

most necessary of all qualities to a metaphysician. It is impossible, indeed, to turn to any page in his writings that does not contain some feat of ingenuity. States of mind that had been looked upon for ages as reduced to the last degree of simplicity, and as belonging to those facts in our constitution which the most sceptical could not doubt, and the most subtle could not explain, he brought to the crucible, and evolved from their simpler elements. For the most complicated and puzzling questions that our mysterious and almost inscrutable nature presents, he found a quick and easy solution. The knot that thousands had left in despair, as too complicated for mortal hand to undo, and which others more presumptuous had cut in twain, he unloosed with unrivalled dexterity. The enigmas which a false philosophy had so long propounded, and which, because they were not solved, had made victims of many of the finest and most highly gifted men of our race, he at last succeeded in unriddling." Dr. Brown's lectures were published after his death, in 4 volumes, 8vo, and have deservedly obtained a high reputation. An account of his life and writings has been published in one volume 8vo, by the late Rev. Dr. David Welsh.

BROWN, WILLIAM LAWRENCE, D.D., an eminent theological and miscellaneous writer, was born January 7, 1755, at Utrecht, where his father, the Reverend William Brown, was minister to the English congregation. In 1757 his father removed with his family to St. Andrews, in order to undertake the duties of professor of ecclesiastical history; and the subject of our memoir, having commenced his education under his father's care, was placed successively at the grammar-school and university of that city, entering the latter at the early age of twelve. His native abilities, favoured by the fostering care of his father, enabled him, notwithstanding his immature years, to pass through his academical course with distinction; classical literature, logic, and ethics, being the branches of study to which he chiefly devoted his attention. After studying divinity for two years at St. Andrews, he removed to Utrecht, where he prosecuted the same study, and also that of civil law. In 1778, having previously been licensed by the presbytery of St. Andrews, he succeeded his uncle as minister of the English church at Utrecht; a field of exertion too narrow for his abilities, but which he, nevertheless, cultivated with the same zeal and application which a conscientious clergyman might be expected to bestow upon one more extensive. Such spare time as his duties left to him he employed in attention to a few pupils whom he received into his house. He at the same time enlarged his range of study, and occasionally made excursions into France, Germany, and Switzerland. In 1786 he married his cousin, Anne Elizabeth Brown, by whom he had five sons and four daughters.

The first literary effort of Mr. Brown was an essay on the origin of evil, written for a prize offered by the curators of the Holpian legacy at Utrecht, and which was adjudged the second honour among the essays of twenty-five competitors, that of being published at the expense of the trust. Soon after this, namely, in 1784, the university of St. Andrews conferred upon him the degree of Doctor in Divinity. Dr. Brown was successful in several other prize essays, two of which were published under the titles of *An Essay on the Folly of Scepticism*, London, 1788; and *An Essay on the Natural Equality of Man*, Edinburgh, 1793. The latter took a more sober view of the subject than was generally adopted at

the time of its publication; and it accordingly became the means of introducing Dr. Brown to the notice of the British government. Previously to the armed interposition of the Prussians in 1788, Dr. Brown was exposed to so much annoyance on account of his attachment to the dynasty of Nassau, that he found it necessary to proceed to London, in quest of another situation. The event alluded to not only enabled him to retain his former office, but caused his elevation to a professorship, newly erected in the university of his native city, for moral philosophy and ecclesiastical history. He unfortunately was not allowed sufficient time to prepare the two elaborate courses of lectures required in this new situation; and, by his extraordinary exertions to accomplish what was expected of him, laid the foundation of ailments, from which he never afterwards recovered. His inaugural discourse was published under the title of *Oratio de Religionis et Philosophia Societate et Concordia maxime Salutari*. Two years afterwards he was nominated rector of the university; and on depositing his temporary dignity, he pronounced an *Oratio de Imaginatione in Vite Institutione regenda*, which was published in 1790. Though offered the Greek professorship at St. Andrews, he continued in Utrecht till the invasion of Holland by the French, in the beginning of 1795, when he was obliged to leave the country in an open boat, with his wife and five children, besides some other relations. Notwithstanding the severity of the season, the roughness of the weather, and the frail nature of the bark to which so many lives were committed, he reached the English coast in safety. In London, to which he immediately proceeded, he met with a friendly reception from Lord Auckland, to whom he had become known during his lordship's residence as ambassador at the Hague, and who now exerted himself so warmly in his favour, that he was, in the course of a few months, appointed to succeed Dr. Campbell as professor of divinity in the Marischal College, Aberdeen; to which honourable appointment was soon after added that of principal of the same college.

We are informed by the writer of the life of Dr. Brown in the *Encyclopædia Britannica*, that "this new professorship imposed upon him a very serious task, that of composing a course of theological lectures, extending over five sessions. After a review of the different systems of religion which lay claim to a divine origin, he discussed most amply the evidences and doctrines of natural religion. He then proceeded to the evidences of revealed religion, of which he gave a very full and learned view. The Christian scheme formed the next subject of an inquiry, in which the peculiar doctrines of Christianity were very extensively unfolded. Christian ethics were also explained; and it formed part of his original plan, to treat of all the great controversies that have agitated the religious world. This portion of the course was not, however, completed." Besides attending to the duties of his chair and of his principalship, Dr. Brown officiated as one of the ministers of the West Church in Aberdeen. A volume of his sermons appeared in 1803. He also occasionally attended the General Assembly, where his manly eloquence and impressive mode of speaking caused him to be listened to with great respect, though he never arrived at the character of a leader. While discharging every public duty with zeal and efficacy, he did not neglect his favourite pursuits of literature. In 1809 he published *Philemon, or the Progress of Virtue, a poem*, Edinburgh, 2 vols. octavo; and in 1816 appeared his greatest literary effort, *An Essay on the Existence of a Supreme Creator*, Aberdeen,

2 vols. octavo. The latter was the successful competing essay, among fifty, for Burnet's first prize of £1250; the second, of £400, being awarded to Dr. Sumner, afterwards Bishop of Chester. Dr. Brown also wrote a few pamphlets upon passing occurrences, political and otherwise; and one or two articles in Latin, relating to formalities in the university over which he presided. His last considerable work was *A Comparative View of Christianity, and of the other Forms of Religion which have existed, and still exist, in the World, particularly with regard to their Moral Tendency*, Edinburgh, 2 vols. octavo, 1826.

In addition to the preferments already mentioned, Dr. Brown was honoured, in 1800, with the appointment of chaplain in ordinary to the king; and, in 1804, was nominated dean of the chapel-royal, and of the order of the Thistle. He was, last of all, in 1825, appointed to read the Gordon course of lectures on practical religion, in the Marischal College. Though thus bearing such a multiplicity of offices, Dr. Brown was, upon principle, opposed to pluralities, and was, perhaps, only tempted to transgress the rule in his own case, by the want of adequate endowments for his two chief offices, those of divinity professor and of principal.

Dr. Brown died, May 11, 1830, in the seventy-sixth year of his age. Besides his great talents and acquirements, he was characterized by many excellent personal qualities. His mind was altogether of a manly cast; and, though honoured with the regards of a court, he was incapable of cowering to mere rank and station. With some warmth of temper, he was open, sincere, and generous, and entertained sentiments of unbounded liberality towards his fellow-creatures of all ranks, and of all countries.

BRUCE, JAMES, a celebrated traveller, born on the 14th of December, 1730, at Kinnaird, in the county of Stirling. Bruce was by birth a gentleman, and might even be considered as nobly descended. He was the eldest son of David Bruce, Esq. of Kinnaird, who was in turn the son of David Hay of Woodcockdale in Linlithgowshire (descended from an old and respectable branch of the Hays of Errol), and of Helen Bruce, the heiress of Kinnaird, who traced her pedigree to that noble Norman family, which, in the fourteenth century, gave a king to Scotland. It will thus be observed that the traveller's paternal name had been changed from Hay to Bruce, for the sake of succession to Kinnaird. The traveller was extremely vain of his alliance to the hero of Bannockburn, inasmuch as to tell his engraver, on one occasion, that he conceived himself entitled to use royal livery! He took it very ill to be reminded, as he frequently was, that in reality, he was not a Bruce, but a Hay, and though the heir of line, not the *heir male* of even that branch of the family which he represented. In truth the real Bruces of Kinnaird, his grandmother's ancestors, were but descended from a cadet of a cadet of the royal family of Bruce, and, as it will be observed, sprung off before the family became royal, though not before it had intermarried with royalty. His mother was the daughter of James Graham, Esq. of Airth, dean of the faculty of advocates, and judge of the high court of admiralty in Scotland—a man distinguished by his abilities and respected for his public and private virtues. Unfortunately, the traveller lost his mother at the early age of three years—almost the only worldly loss which cannot be fully compensated. His father marrying a second time, had an additional family of six sons and two daughters.

In his earliest years, instead of the robust frame

JAMES BRINDLEY
OF LITTON

and bold disposition which he possessed in manhood, Bruce was of weakly health and gentle temperament. At the age of eight years a desire of giving his heir-apparent the best possible education, and perhaps also the pain of seeing one motherless child amidst the more fortunate offspring of a second union, induced his father to send him to London, to be placed under the friendly care of his uncle, Counsellor Hamilton. In that agreeable situation he spent the years between eight and twelve, when he was transferred to the public school at Harrow, then conducted by Dr. Cox. Here he won the esteem of his instructors, as well as of many other individuals, by the extraordinary aptitude with which he acquired a knowledge of classic literature, and the singularly sweet and amiable dispositions which he always manifested. To this reputation his weakly health, and the fear that he was destined, like his mother, to an early grave, seems to have given a hue of tenderness, which is seldom manifested for merely clever scholars. The gentleness of his character, the result solely of bad health, led him at this early period of his life to contemplate the profession of a clergyman; a choice in which he might, moreover, be further satisfied, from a recollection of his ancestor, Robert Bruce of Kinnaird, who was the leading divine in Scotland little more than a century before. So completely, however, do the minds of men take colour from their physical constitution, that on his health becoming confirmed with advancing manhood, this tame choice was abandoned for something of a bolder character; which, in its turn, appears to have given way, in still further increased strength, for something bolder still. He left Harrow with the character of a first-rate scholar, in May, 1746, and, after spending another year at an academy in the study of French, arithmetic, and geometry, returned, May, 1747, to Kinnaird, where he spent some months in the sports of the field, for which he suddenly contracted a deep and lasting attachment. It was now determined that he should prepare himself for the profession of an advocate; a road to distinction, which, as it was almost the only one left to Scotland by the Union, was then, and at a much later period, assumed by an immense proportion of the young Scottish gentry. He entered, in the winter of 1747, as a student in the college of Edinburgh, and attended the lectures on civil law, Scottish law, and universal history. But the study was not congenial to his mind, and he probably thought it a happy event that a return of bad health relieved him from this bondage. He was remanded to Kinnaird for exercise and air; and for several years he remained undetermined as to his future course of life. Be it remarked, there might have been no necessity for his leaving the paternal home in search of fortune, had not the number of his father's second family diminished his prospects of wealth from that source.

Having at length resolved upon going to India, at that time a more adventurous field than it has since become, Bruce left Scotland, July, 1753, in the twenty-third year of his age, and arriving in London, was received in the kindest manner by those friends with whom he had formerly resided. While waiting for the permission of the East India directors to settle there as a free trader, he was introduced to Adriana Allan, the beautiful and most amiable daughter of a wealthy wine-merchant deceased. An attachment to this young lady, which soon proved mutual, once more changed his destination in life. On making known his feelings to the surviving parent of his mistress, it was suggested that, in marrying her, he might also wed himself to the excellent business left

by her father. Love easily overcame every scruple he might entertain regarding this scheme; and accordingly, on the 3d February, 1754, he was married to Miss Allan. For some months Bruce enjoyed the society of this excellent creature, and during that time he applied himself to business with an enthusiasm borrowed from love. But, unfortunately, the health of his partner began to decline. It was found necessary that she should visit the south of France for a milder climate. Bruce accompanied her on this melancholy journey. Consumption outstripped the speed with which they travelled. She was unable to move beyond Paris. There, after a week's suffering, she died in his arms. By this event the destiny of Bruce was once more altered. The tie which bound him to trade—almost to existence, was broken. He seems to have now thought it necessary that he should spend a life of travel. Abandoning the cares of business to his partner, and resolving to take an early opportunity of giving up his share altogether, he applied himself to the study of the Spanish and Portuguese languages, and also improved his skill in drawing, under a master of the name of Bonneau, recommended to him by Mr. (afterwards Sir Robert) Strange. Before this time he had chiefly cultivated that part of drawing which relates to the science of fortification, in hopes that he might, on some emergency, find it of use in military service. But views of a more extensive kind now induced him to study drawing in general, and to obtain a correct taste in painting. This notice of his application to the study of drawing we have given in the words of his biographer (Dr. Murray), because it was long and confidently reported by those who wished to lessen his reputation, that he was totally and incorrigibly ignorant of the art.

In July, 1757, he sailed for Portugal, landed at Corunna, and soon reached Lisbon. He was much struck by the ways of the Portuguese, many of which are directly opposite to those of all other nations. A Portuguese gentleman, showing out a friend, walks *before* him to the door; a Portuguese boatman rows with his face to the front of the vessel, and lands stern foremost; when a man and woman ride on horseback, the woman is foremost, and sits with her face to the right side of the animal. And what, in Bruce's opinion, accounted for all this contrariety, the children are rocked in cradles which move from head to foot. From Portugal, after four months' stay, Bruce travelled into Spain, where he also spent a considerable time. The sight of the remains of Moorish grandeur here inspired him with the wish of writing an account of the domination of that people in Spain; but he found the materials inaccessible through the jealousy of the government. Leaving Spain, he traversed France, visited Brussels, and, passing through Holland into Germany, there witnessed the battle of Crevelt. Returning by Rotterdam, he received intelligence of the death of his father, by which event he became laird of Kinnaird. The property he thus acquired was soon after considerably increased by the establishment of the Carron company, which was supplied with coal from his mines. He now employed himself in studying the Arabic language, a branch of knowledge then little regarded in Britain. In 1761 he withdrew entirely from the wine trade. About this time Bruce formed an acquaintance with Mr. Pitt (the elder), then at the head of affairs, to whom he proposed a scheme for making a descent upon Spain, against which country Britain was expected to declare war. Though this project came to nothing, Lord Halifax had marked the enterprising genius of this Scottish

gentleman, and proposed to him to signalize the commencement of the new reign by making discoveries in Africa. It was not part of this proposal that he should attempt to reach the source of the Nile; that prodigious exploit, which had baffled the genius of the civilized world for thousands of years, seemed to Lord Halifax to be reserved for some more experienced person; his lordship now only spoke of discoveries on the coast of Barbary, which had then been surveyed, and that imperfectly, by only one British traveller, Dr. Shaw. For this end Bruce was appointed to be consul at Algiers. In an interview with George III., with which he was honoured before setting out, his majesty requested him to take drawings of the ruins of ancient architecture which he should discover in the course of his travels. It having been provided that he should spend some time by the way in Italy, he set out for that country in June, 1762. He visited Rome, Naples, and Florence, and fitted himself by surveying the works of ancient art, for the observations he was to make upon kindred objects in Africa. Here he formed an acquaintance with a native of Bologna, named Luigi Balgani, whom he engaged to attend him in his travels, in the capacity of an artist. He at length sailed from Leghorn to Algiers, which he reached in March, 1763. Ali Pacha, who then acted as dey in this barbarous state, was a savage character, not unlike the celebrated personage of the same name, whom Lord Byron introduced to European notice. An injudicious yielding to his will, on the part of the English government, who changed a consul at his request, had just given an additional shade of insolence and temerity to his character; and he expected to tyrannize over Bruce as over one of his own officers. The intrepidity of the new consul, it may be imagined, was, under such circumstances, called into frequent action. He several times bearded this lion in his very den, always apparently indebted for his safety to the very audacity which might have been expected to provoke his ruin. A good idea of the true British fortitude which he exerted under such circumstances, may be gained from a letter to Lord Halifax, in which, after recommending forcible measures, which would have been highly dangerous to his own personal security, he says,—“I myself have received from a friend some private intimations to consult my own safety and escape. The advice is impracticable, nor would I take it were it not so. Your lordship may depend upon it, that till I have the king’s orders, or find that I can be of no further service here, nothing will make me leave Algiers but force. One brother has already, this war, had the honour to lose his life in the service of his country. Two others, besides myself, are still in it, and if any accident should happen to me, as is most probable from these lawless butchers, all I beg of his majesty is that he will graciously please to extend his favour to the survivors, if deserving, and that he will make this city an example to others, how they violate public faith and the law of nations.” It is this constancy and firmness in postponing the consideration of danger to the consideration of duty, which has mainly tended to exalt the British character above those of other nations. Bruce weathered every danger till August, 1765, when, being relieved by the arrival of another consul, he left this piratical stronghold, and began to prosecute his researches along the coast of Africa. Landing at Bona, he paid a visit to Utica, “out of respect to the memory of Cato,” and then, with a proper retinue for his protection, penetrated into the interior of the kingdoms of Algiers and Tunis. On the borders of these states he found a tribe named

the Welled Sidi Boogannin, who are exempted from taxes on condition of their living exclusively upon lions; a means of keeping down those enemies of the public. Dr. Shaw, the only British predecessor of Bruce in this line of research, had been much laughed at, and even openly scouted, for having hinted at the existence of such a custom. His friends at Oxford thought it a subversion of the established order of things, that a man should eat a lion, when it had long passed as almost the peculiar province of the lion to eat the man. Bruce was exactly the man to go the more boldly forward when such a lion was in the way.

After having traversed the whole of these states, and taken drawings of every antiquity which he esteemed worthy of notice, he moved further west to Tripoli, where he was received with great kindness by Mr. Fraser of Lovat, British consul at that place. From Tripoli he despatched the greater part of his drawings to Smyrna, by which precaution they were saved from the destruction which must have otherwise been their fate. Crossing the Gulf of Sidra, which makes a considerable sweep into the northern coast of Africa, Bruce now reached Bengazi—the ancient Berenice built by Ptolemy Philadelphus. From this place he travelled to Ptolemeta, where, finding the plague raging, he was obliged to embark hastily in a Greek vessel which he hired to carry him to Crete. This was perhaps the most unlucky step he took during the whole of his career. The vessel was not properly provided with ballast; the sails defied the management of the ignorant man who professed to steer it; it had not therefore got far from shore when a storm drove it to leeward, and it struck upon a rock near the harbour of Bengazi. Bruce took to the boat, along with a great number of the other passengers; but finding that it could not survive, and fearing lest he should be overwhelmed by a multitude of drowning wretches, he saw it necessary to commit himself at once to the sea, and endeavour to swim ashore. In this attempt, after suffering much from the violence of the surf, he was at last successful. He had only, however, become exposed to greater dangers. A plundering party of Arabs came to make prey of the wrecked vessel, and his Turkish clothing excited their worst feelings. After much suffering he got back to Bengazi, but with the loss of all his baggage, including many valuable instruments and drawings. Fortunately, the master of a French sloop, to whom he had rendered a kindness at Algiers, happened to be lying in that port. Through the grateful service of this person he was carried to Crete. An ague, however, had fixed itself upon his constitution in consequence of his exertions in the sea of Ptolemeta: it attacked him violently in Crete, and he lay for some days dangerously ill. On recovering a little, he proceeded to Rhodes, and from thence to Asia Minor, where he inspected the ruins of Baalbec and Palmyra. By the time he got back to Sidon he found that his letters to Europe announcing the loss of his instruments were answered by the transmission of a new set, including a quadrant from Louis XV., who had been told by Count Buffon of the unhappy affair of Bengazi. In June, 1768, he sailed from Sidon to Alexandria, resolved no longer to delay that perilous expedition which had taken possession of his fancy. “Previous to his first introduction to the waters of the Nile,” says Captain Head, “it may not be improper, for a moment, calmly and dispassionately to consider how far he was qualified for the attempt which he was about to undertake. Being thirty-eight years of age, he was at that period of life in which both the mind and body of man are capable

of their greatest possible exertions. During his travels and residence in Europe, Africa, and Asia, he had become practically acquainted with the religion, manners, and prejudices of many countries different from his own; and he had learned to speak the French, Italian, Spanish, modern Greek, Moorish, and Arabic languages. Full of enterprise, enthusiastically devoted to the object he had in view, accustomed to hardship, inured to climate as well as to fatigue, he was a man of undoubted courage; *in stature six feet four*, and with this imposing appearance possessing great personal strength; and lastly, in every proper sense of the word, he was a gentleman; and no man about to travel can give to his country a better pledge for veracity than when, like Bruce, his mind is ever retrospectively viewing the noble conduct of his ancestors—thus showing that he considers he has a stake in society which, by the meanness of falsehood or exaggeration, he would be unable to transmit unsullied to posterity."

From Alexandria he proceeded to Cairo, where he was received with distinction by the bey, under the character of a dervish, or soothsayer, which his acquaintance with eastern manners enabled him to assume with great success. It happened—fortunately for his design—that in the neighbourhood of Cairo resided a Greek patriarch who had lived some time under his roof at Algiers, and taught him the modern Greek language. This person gave him letters to many Greeks who held high situations in Abyssinia, besides a bull, or general recommendation, claiming protection for him from the numerous persons of that nation residing in the country. Bruce had previously acquired considerable knowledge of the medical art, as part of that preparatory education which he had fitted himself for his great task. The bey fortunately took ill: Bruce cured him. His highness, in gratitude, furnished him with recommendatory letters to a great number of ruling personages throughout Egypt and along both shores of the Red Sea. Bruce, thus well provided, commenced his voyage up the Nile, December 12, 1768, in a large canja or boat, which was to carry him to Furshoot, the residence of Amner, the sheikh of Upper Egypt. For two or three weeks he enjoyed the pleasure of coasting at ease and in safety along the wonder-studded banks of this splendid river, only going on shore occasionally to give the more remarkable objects a narrower inspection. He was at Furshoot on the 7th of January, 1769. Advancing hence to Sheikh Amner, the encampment of a tribe of Arabs, whose dominion extended almost to the coast of the Red Sea, he was fortunate enough to acquire the friendship of the sheikh, or head of the race, by curing him of a dangerous disorder. This secured him the means of prosecuting his journey in a peaceable manner. Under the protection of this tribe he soon reached Cossair—a fort on the Red Sea—having previously, however, sent all his journals and drawings, hitherto completed, to the care of some friends at Cairo. Bruce sailed from Cossair on the 5th of April, and for several months he employed himself in making geographical observations upon the coasts of this important sea. On the 19th of September, after having for the first time determined the latitude and longitude of many places, which have since been found wonderfully correct, he landed at Massuah, the port of Abyssinia. Here he encountered great danger and difficulty, from the savage character of the *nyabé* or governor of Massuah, who, not regarding the letters carried by Bruce from the Bey of Cairo, had very nearly taken his life. By the kindness of Achmet, a nephew of the *nyabé*, whom Bruce rescued from a deadly sickness, he was

enabled to surmount the obstacles presented against him in this place, and on the 15th November began to penetrate the country of Abyssinia. In crossing the hill of Tarenta, a mountainous ridge which skirts the shore, the traveller encountered hardships under which any ordinary spirit would have sunk. Advancing by Dixan, Adowa, and Axum, he found himself greatly indebted for safety and accommodation to the letters which he carried for the Greeks, who formed the civilized class amongst that rude people. It was in the neighbourhood of Axum that he saw the unfortunate sight (the slicing of steaks from the rump of a live cow) which was the chief cause of his being afterwards generally discredited in his own country. On the 14th of February, after a journey of ninety-five days from Massuah, he reached Gondar, the capital of Abyssinia, a town containing about 10,000 families. The king and his chief minister Ras Michael, to both of whom Bruce had letters of introduction, were now absent with the army, putting down a rebellion which had been raised by Fasil, a turbulent governor of a province. But Bruce was favourably received by one Ayto Aylo, a Greek, and chamberlain of the palace. It happened that the favourite child of Ras Michael was at this time ill with the small-pox at the country palace of Koscam. Ozoro Esther, the beautiful young wife of Ras Michael, and the mother of this child, watched over the sick-bed with intense anxiety. Bruce, by the good offices of Ayto Aylo, was introduced to the distracted mother as a skillful physician; and after some preliminary civilities, he undertook to cure the child, in which task he very soon succeeded.

Having thus at once secured favour in a very high quarter, he waited patiently for two or three weeks, when the king and Ras Michael, having gained a victory, returned to Gondar, and Bruce was then presented to them. Ras Michael, at the first interview, acknowledged the powerful nature of Bruce's recommendations, but explained to him that, owing to the present convulsed state of the country, it would be difficult to afford him all the protection that might be wished. It appeared to Michael that the best way of insuring personal safety and respect for him throughout the country would be to give him a high office in the king's household. Bruce consented from the conviction that in becoming baalomaal, and commander of the Koccob horse, he was doing his best towards facilitating his journey. While acting in the capacity of baalomaal—which seems to have been somewhat like the British office of lord of the bed-chamber—he secured the king's favour and admiration by the common school-boy trick of shooting a small candle through a dense substance. He was now appointed to be governor of a large Mahometan province which lay on the way he designed to take in returning home: this duty, however, he could perform by deputy. In May the army set out from Gondar to meet the rebel Fasil, and Bruce took that share in the fatigues and perils of the campaign which his office rendered necessary. He was of great service in improving the discipline of the army, and was looked upon as a finished warrior. After a good deal of marching and counter-marching, the royal forces gained a complete victory over Fasil, who was consequently obliged to make his submission. This rebel now lived on amicable terms with the king and his officers, and Bruce, recollecting the interesting site of his government, busied himself in performing medical services to his principal officers. When the king came to ask Bruce what reward he would have for his share in the campaign, the enthusiastic traveller answered that he only wished two favours,—the property of the village of Geesh, with

the spot in its neighbourhood where he understood the Nile to arise, and a royal mandate obliging Fasil to facilitate his journey to that place. The king, smiling at the humility of his desires, granted the request, only regretting that Yagoube (such was the name assumed by Bruce in his travels) could not be induced to ask something ten times more precious. The attention of the sovereign and his minister were now distracted by the news of another insurrection in the western parts of the kingdom; and it was necessary to move the army in that direction. Bruce made the excuse of his health (which was really bad) to avoid attendance in this campaign; and at length, with some difficulty, he obtained the king's permission to set out for Geesh, which he was now resolved on, notwithstanding that the breaking out of another rebellion foreboded ill for the continued submission of Fasil, and consequently for the safety of the traveller. Bruce set out upon this last great stage of his journey on the 28th of October, 1770, and he was introduced to the presence of Fasil at a place called Bamba. Fasil, partly through the representations of those officers to whom Bruce had recommended himself, was in reality favourably disposed to him; but he at first thought proper to affect a contrary sentiment, and represented the design as impracticable. In the course of the wrangling which took place between the two on this subject, Bruce was so much incensed that his nose spontaneously gushed with blood, and his servant had to lead him from the tent. Fasil expressed sorrow at this incident, and immediately made amends by taking measures to facilitate Bruce's journey. He furnished him with a guide called Woldo, as also seven savage chieftains of the country for a guard, and furthermore added, what was of greater avail than all the rest—a horse of his own, richly caparisoned, which was to go before the travelling party as a symbol of his protection, in order to insure the respect of the natives. By way of giving a feasible appearance to the journey, Bruce was invested by Fasil with the property and governorship of the district of Geesh, in which the Nile rises; so that this strangely disguised native of Stirlingshire, in the kingdom of Scotland, looked entirely like an Abyssinian chief going to take possession of an estate in the highlands of that remote and tropical country.

Bruce left Fasil's house on the 31st of October, and as he travelled onward for a few days through this rude territory, the people, instead of giving him any annoyance, everywhere fled at his approach, thinking, from the appearance of Fasil's horse, that the expedition was one of taxation and contribution. Those few whom Bruce came in contact with, he found to have a religious veneration for the Nile, the remains of that pagan worship which was originally paid to it, and which was the sole religion of the country before the introduction of Christianity. Even the savages who formed his guard, would have been apt, as he found, to destroy him, if he had crossed the river on horseback, or employed its waters in washing any part of his dress. He also learned that there was still a kind of priest of this worship, who dwelt at the fountain of the Nile, and was called "the servant of the river." It thus appeared that, as in the ruder parts of Bruce's native country, the aboriginal religion had partly survived the ordinances of a new and purer worship for many centuries. It was early in the afternoon of November 3d, that Bruce surmounted a ridge of hills which separated him from the fountain of the Nile, and for the first time cast his European eyes on that object—the first, and, we believe, the only European eyes that have ever beheld it. It was pointed out to him

by Woldo, his guide, as a hillock of green sod in the middle of a marshy spot at the bottom of the hill on which he was standing. To quote his own account of so remarkable a point in his life—"Half undressed as I was, by the loss of my sash, and throwing off my shoes [a necessary preliminary to satisfy the pagan feelings of the people], I ran down the hill, towards the hillock of green sod, which was about 200 yards distant; the whole side of the hill was thick grown with flowers, the large bulbous roots of which appearing above the surface of the ground, and their skins coming off on my treading upon them, occasioned me two very severe falls before I reached the brink of the marsh. I after this came to the altar of green turf, which was apparently the work of art, and I stood in rapture above the principal fountain, which rises in the middle of it. It is easier to guess than to describe the situation of my mind at that moment—standing in that spot which had baffled the genius, industry, and inquiry of both ancients and moderns for the course of near 3000 years. Kings had attempted this discovery at the head of armies, and each expedition was distinguished from the last only by the difference of numbers which had perished, and agreed alone in the disappointment which had uniformly and without exception followed them all. Fame, riches, and honour had been held out for a series of ages to every individual of those myriads these princes commanded, without having produced one man capable of gratifying the curiosity of his sovereign, or wiping off this stain upon the enterprise and abilities of mankind, or adding this desideratum for the encouragement of geography. Though a mere private Briton, I triumphed here, in my own mind, over kings and their armies! and every comparison was leading nearer and nearer to presumption, when the place itself where I stood, the object of my vainglory, suggested what depressed my short-lived triumph. I was but a few minutes arrived at the sources of the Nile, through numberless dangers and sufferings, the least of which would have overwhelmed me but for the continual goodness and protection of Providence: I was, however, but then half through my journey and all those dangers through which I had already passed awaited me on my return;—I found a despondency gaining ground fast, and blasting the crown of laurels I had too rashly woven for myself." In this paragraph—one of the most deeply touching ever written—we find the Herculean mind of Bruce giving way, under the influence of success, to sensations which had scarcely ever affected him during the whole course of his journey, while as yet the desire of going onward and the necessity of providing the means of doing so with safety, possessed and amused his mind. There might also mingle with the varied tide of his sensations a reluctantly acknowledged sense of the futility of all his exertions, and perils, and sufferings, since they had only obtained for him the sight of a pagan altar from which proceeded one of the feeders, not certainly known to be the principal one, of the mighty Nile: to what good could this sight conduce, since, after all, it was only a sight? the object having been all along proved to exist, by the mere laws of nature. The traveller relates that his despondency continued for some time; and that, as he could not reason it away, he resolved to direct it till he might be able, on more solid reflection, to overcome its progress. Calling to Strates, a faithful Greek, who had accompanied him throughout all his Abyssinian travels, he said, "Strates, faithful squire! come and triumph with your Don Quixote at that island of Barataria, to which we have most wisely and fortunately brought ourselves! Come and triumph with

me over all the kings of the earth, all their armies, all their philosophers, and all their heroes!" "Sir," says Strates, "I do not understand a word of what you say, and as little of what you mean: you very well know I am no scholar." "Come," said I, "take a draught of this excellent water, and drink with me a health to his Majesty George III., and a long line of princes." I had in my hand a large cup, made of a cocoa-nut shell, which I procured in Arabia, and which was brimful." [This cup was brought home by Bruce, and his representatives at Kinnaird still use it every day when they entertain company at dinner.] "He drank to the king speedily and cheerfully, with the addition of 'confusion to his enemies,' and tossed up his cap with a loud huzza. 'Now friend,' said I, 'there is to a more humble, but still a sacred name—here is to Maria!'" This was a Scottish lady, we believe, a Miss Murray of Polmaise, to whom Bruce had formed an attachment before leaving his native country. These ceremonies being completed, he entered the village of Geesh, and assumed for four days the sovereignty to which Fasil had given him a title. During this brief space he made forty observations as to the exact geographical site of the fountain, and found it to be in north latitude $10^{\circ} 59' 25''$, and $36^{\circ} 55' 30''$ east longitude, while its position was supposed from the barometer to be two miles above the level of the sea. Bruce left Geesh upon his return on the 10th of November, and he arrived at Gondar, without any remarkable adventure, on the 17th. Here he found that Fasil had set a new insurrection on foot, and had been again unsuccessful. For some time great numbers of his adherents, or rather the adherents of a mock king whom he had set up, were daily sacrificed. Bruce was at first somewhat uneasy in this disagreeable scene, and the maxim of the Abyssinians, never to permit a stranger to quit the country, came full upon his mind. Early, however, in January 1771, he obtained the king's permission, on the plea of his health, to return home, though not without a promise that he would come back when his health was re-established, bringing with him as many of his family as possible, with horses, muskets, and bayonets. Ere he could take advantage of this permission, fresh civil wars broke out, large provinces became disturbed, and Bruce found that, as he had had to take part in the national military operations in order to pave the way for reaching the head of the Nile, so was it now necessary that he should do his best for the suppression of the disturbances, that he might clear his way towards home. During the whole of the year 1771 he was engaged with the army, and he distinguished himself so highly as a warrior, that the king presented him with a massive gold chain, consisting of 184 links, each of them weighing $3\frac{1}{2}$ dwts. It was not till the 26th of December, thirteen months after his return from the source of the Nile, that he set out on his way towards Europe; nor even then was the country reduced to a peaceable condition. He was accompanied by three Greeks, an old Turkish Janissary, a captain, and some common muleteers; the Italian artist Balugani having died at Gondar. On account of the dangers which he had experienced at Massuah from the barbarous naybe, he had resolved to return through the great deserts of Nubia into Egypt, a tract by which he could trace the Nile in the greater part of its course.

On the 23d of March, after a series of dreadful hardships, he reached Teawa, the capital of Abbara, and was introduced to the sheikh, who, it seemed, was unwell, though not so much so as to have lost any part of his ferocious disposition. Bruce here met with an adventure, which, as it displays his matchless

presence of mind in a very brilliant light, may be here related. He had undertaken to administer medicine to the sheikh, who was in the alcove of a spacious room, sitting on a sofa surrounded by curtains. On the entrance of Bruce, he took two whiffs of his pipe, and when the slave had left the room said, "Are you prepared? Have you brought the money along with you?" Bruce replied, "My servants are at the other door, and have the vomit you wanted." "Curse you and the vomit too," cried the sheikh in great passion, "I want money and not poison. Where are your piastres?" "I am a bad person," replied Bruce, "to furnish you with either; I have neither money nor poison; but I advise you to drink a little warm water to clear your stomach, cool your head, and then lie down and compose yourself; I will see you to-morrow morning." Bruce was retiring when the sheikh exclaimed, "Hakim [physician], infidel, or devil, or whatever is your name, hearken to what I say. Consider where you are; this is the room where Mek Bady, a king, was slain by the hand of my father: look at his blood, where it has stained the floor, and can never be washed out. I am informed you have 20,000 piastres in gold with you; either give me 2000 before you go out of this chamber, or you shall die; I shall put you to death with my own hand." Upon this he took up his sword, which was lying at the head of his sofa, and drawing it with a bravado, threw the scabbard into the middle of the room, and, tucking the sleeve of his shirt above the elbow, like a butcher, he said, "I wait your answer." Bruce stepped one pace backwards, and laid his hand upon a little blunderbuss, without taking it off the belt. In a firm tone of voice he replied, "This is my answer: I am not a man to die like a beast by the hand of a drunkard; on your life, I charge you, stir not from your sofa. I had no need," says Bruce, "to give this injunction; he heard the noise which the closing of the joint in the stock of the blunderbuss made, and thought I had cocked it, and was instantly to fire. He let his sword drop, and threw himself on his back, upon the sofa, crying, 'For God's sake, hakim, I was but jesting.'" Bruce turned from the cowed bully, and coolly wished him a good night. After being detained three weeks at this place, he set out for Sennaar, the capital of Nubia, which he reached at the end of April. He was here received kindly by the king, but the barbarous maxims of the country caused his detention for upwards of four months, during which the exhaustion of his funds caused him to sell the whole of his gold chain except a few links. At length, on the fifth of September, he commenced his journey across the great desert of Nubia, and then only, it might be said, began the true hardships of his expedition. As he advanced upon the sandy and burning plain, his provisions became exhausted, his camels and even his men perished by fatigue, and he was in the greatest danger, almost every day, of being swallowed up by the moving sands which loaded the breath of the deadly simoom. For weeks and months the miserable party toiled through the desert, enduring hardships of which no denizen of a civilized state can form the least idea. At last, on the 29th of December, just as he had given his men the last meal which remained to them, and when all, of course, had given themselves up for lost, they came within hearing of the cataracts of the Nile, and reached the town of Syene or Assouan, where succour in its amplest forms awaited them. Twelve dreadful weeks Bruce had spent upon the desert: his journey from the capital of Abyssinia to this point had altogether occupied eleven months. It was now exactly four years since he had left civil-

ized society at Cairo; during all which time he had conversed only with barbarous tribes of people, from whose passions no man possessed of less varied accomplishment, less daring, and less address, could have possibly escaped. He sailed down the Nile to Cairo, which he reached on the 10th of January, 1773. He then sailed for Alexandria, whence he easily obtained a passage to Europe. Arriving at Marseilles in March, he was immediately visited and congratulated by a number of the French *savans*, at the head of whom was his former friend, Count de Buffon. For some time however, he was not sufficiently recovered from the debilitating effects of his journey to enjoy the polished society to which he was restored. A mental distress, moreover, had awaited his arrival in Europe. His *Maria*, whose health he had only postponed to that of his sovereign in drinking from the fountain of the Nile, despairing of his return, had given her hand to an Italian Marchese. Bruce withered under this disappointment more than under the sun of Nubia. In a transport of indignation he travelled to Rome, and in a style of rodomontade, only to be excused by a kind consideration of his impetuous and ingenuous character, called the Marchese to account for a transaction in which it was evident that only the lady could be to blame. The Marchese with Bruce's sword almost at his throat, disclaimed having married *Maria* with any knowledge of a previous engagement on her part; and with this Bruce had to rest satisfied. *Mente alta reposit*; his only resource was to bury his regrets in his own proud bosom, and despise the love which could permit a question of time or space to affect it.

In the summer of 1774 he returned to England, from which he had now been absent twelve years. His fame having gone before him, he was received with the highest distinction. He was introduced at court, where he presented to George III. those drawings of Palmyra, Baalbec, and the African cities, which his majesty had requested him to execute before his departure from the country. The triumphs of this enterprising traveller were, however, soon dashed and embittered by the mean conduct of a people and age altogether unworthy of him. Bruce, wherever he went, was required to speak of what he had seen and suffered in the course of his travels. He related anecdotes of the Abyssinian and Nubian tribes, and gave descriptions of localities and natural objects, which certainly appeared wonderful to a civilized people, though only because they were novel; he related nothing either morally or physically impossible. Unfortunately, however, the stories of Bruce were at the very first set down for imaginary tales, furnished forth by his own fancy. This view of the case was warmly taken up by a *clique* of literary men, who, without science themselves, and unchecked by science in others, then swayed the public mind. Even the country gentlemen in Scotland could sneer at the "*lies*" of Bruce. His mind shrunk from the meanness of his fellows; and he retired, indignant and disappointed, to Kinnaird, where, for some time, he busied himself in rebuilding his house, and arranging the concerns of his estate, which had become confused during his long absence. In March, 1776, he provided additional means of happiness and repose, by marrying, for his second wife, *Mary Dundas*, daughter of *Thomas Dundas*, Esq., of *Fingask*, and of *Lady Janet Maitland*, daughter of the *Earl of Lauderdale*. This amiable and accomplished person was much younger than Bruce, and it is rather a singular coincidence, remarks *Captain Head*, that she was born in the same year in which his first wife had died. For nine years

Bruce enjoyed too much domestic happiness to admit of his making a rapid progress in the preparation of his journals for the press. But after the death of his wife, in 1785, he applied to this task with more eagerness, as a means of diverting his melancholy. We have heard that in the composition of his book, he employed the assistance of a professional litterateur, who first transcribed his journals into a continuous narrative, and then wrote them over again, involving all the alterations, improvements, and additional remarks, which the traveller was pleased to suggest. The work appeared in 1790, seventeen years after his return to Europe. It consisted of five large quarto volumes, besides a volume of drawings, and was entitled *Travels to Discover the Sources of the Nile, in the years 1768, 1769, 1770, 1771, 1772, and 1773*, by *James Bruce, of Kinnaird, Esq., F.R.S.* It was dedicated to the king; and it is but justice to the memory of that sovereign to state that, while society in general raised against it the cry of envy, jealousy, and ignorant incredulity, his majesty stood boldly up in its favour, and contended that it was a very great work. The king used to say, that, had it not been for the indecorous nature of certain passages, he could have wished to find it in the hands of all his subjects, and he would himself have placed a copy of it in every one of his palaces. The taste of this monarch did not perhaps lead him to expend great sums in patronizing the arts of the lighter branches of literature, but he certainly was qualified to appreciate, and also disposed to encourage, any exertion on the part of his subjects which had a direct utility, and was consistent with honour and virtue. The *magnum opus* of Bruce was bought up by the public at its very first appearance; it required the whole of the *impression* to satisfy the first burst of public curiosity. It was, in the same year, translated into German and French.

Bruce, in his latter years, lost much of his capabilities of enjoying life by his prodigious corpulence, which at last was indirectly the cause of his death. On the evening of the 27th of April, 1794, after he had entertained a large party at dinner, he was hurrying to escort an old lady down stairs to her carriage, when his foot—that foot which had carried him through so many dangers—slipped upon the steps; he tumbled down the stair, pitched upon his head, and was taken up speechless, with several of his fingers broken. He expired the same night, and was buried in the churchyard of his native parish of *Larbert*, where a monument indicates his last resting-place. To quote the character which has been written for him by *Captain Head*, "Bruce belonged to that useful class of men who are ever ready 'to set their life upon a cast, and stand the hazard of the die.' He was merely a traveller—a knight-errant in search of new regions of the world; yet the steady courage with which he encountered danger—his patience and fortitude in adversity—his good sense in prosperity—the tact and judgment with which he steered his lonely course through some of the most barren and barbarous countries in the world, bending even the ignorance, passions, and prejudices of the people he visited to his own advantage—the graphic truth with which he described the strange scenes which he had witnessed, and the inflexible fortitude with which he maintained his assertions against the barbarous incredulity of his age, place him at the top of his own class, while he at least stands *second to no man*." Bruce understood French, Italian, Spanish, and Portuguese—the two former he could write and speak with facility. Besides Greek and Latin, which he read well, but not critically, he knew the Hebrew, Chaldee, and Syriac, and in the latter part of his life

compared several portions of the Scripture in those related dialects. He read and spoke with ease Arabic, Ethiopic, and Amharic, which had proved of the greatest service to him in his travels. It is said that the faults of his character were inordinate family pride, and a want of that power to accommodate one's self to the weaknesses of others, which is so important a qualification in a man of the world. But amidst the splendours of such a history, and such an intellect, a few trivial weaknesses—even allowing those to be so—are as notes in the meridian sun. A second edition of *Bruce's Travels* was published in 1805 by Dr. Alexander Murray, from a copy which the traveller himself had prepared to put to press. The first volume of this edition contains a biographical account of the author by Dr. Murray, whose learning well fitted him for so peculiar a task as that of revising *Bruce's Travels*.

BRUCE, JAMES. See ELGIN, EARL OF.

BRUCE, MICHAEL, with whose name is associated every great that can be inspired by the early extinction of genius of a high order, still farther elevated by purity of life, was born at Kinrosswood, in the parish of Portmoak, Kinrosshire, on the 27th of March, 1746. His father, Alexander Bruce, a weaver, and his mother, whose name was also Bruce, were honest and pious Burghers; they had eight children, Michael being the fifth. Manifesting from his earliest years much delicacy of frame and quickness of parts, it was resolved to train him for the church; and after acquiring the elements of education at the school of his native parish and of Kinross, he was sent to the college of Edinburgh in 1762. Here he remained four years, devoting himself during the three first to those branches of learning pursued by what are called students of philosophy, and in the last applying also to the study of divinity.

Before quitting Kinrosshire, he had given proofs of his predilection for poetry, which was encouraged by his friendship with Mr. Arnot, a farmer on the banks of Lochleven, who, to the piety and good sense common among those of his profession, added classical scholarship and an acquaintance with elegant literature. He directed Bruce to the perusal of Spenser, Shakspeare, and Milton, supplied him with the books, and became a judicious adviser in regard to his youthful essays in the poetic art. Mr. David Pearson, a man who read much with advantage, had also the taste to relish what Bruce had the talents to produce, and enjoyed his intimacy. After removing to Edinburgh, he lived in habits of close intercourse with Mr. George Henderson and Mr. William Dryburgh, who opened to him their stores of books and information as they did their affections, and with Logan, whose congenial turn of mind made him the friend of Bruce in his lifetime, and his warm eulogist and editor of his works when he was no more. No one deserved better the attachment of those with whom he associated. "No less amiable as a man," says Logan, "than valuable as a writer; endued with good nature and good sense; humane, friendly, benevolent; he loved his friends, and was beloved by them with a degree of ardour that is only experienced in the era of youth and innocence." The prominent place he has given in his poems to those from whose society he had derived delight, shows how sincere was the regard he cherished for them. As if that none of the ties by which life is endeared should be wanting to him, Bruce had fixed his affections on a young woman, modest and beautiful, with whose parents he resided while teaching a school at Gairny Bridge. He has celebrated her under the name of Eumelia, in his pastoral of *Alexis*, and she was also

the heroine of the only two songs he is known to have written.

It appears that the parents of the poet entertained peculiarly rigid notions in regard to religion, and would have been seriously displeased if they had known that any part of their son's attention was occupied by subjects apart from his theological studies. Bruce anxiously avoided giving these prejudices any cause of offence, and, when about to return home from college in 1765, took the precaution of transmitting to his friend Arnot those volumes of which he knew his father would disapprove. "I ask your pardon," says his letter on this occasion, "for the trouble I have put you to by these books I have sent. The fear of a discovery made me choose this method. I have sent Shakspeare's works, 8 vols., Pope's works, 4 vols., and Fontenelle's *Plurality of Worlds*."

Bruce acknowledges that he felt his poverty deeply when he saw books which he ardently desired to possess exposed to sale, and had not money to lay out in the purchase. The same regret has been experienced by many a poor scholar; but few perhaps terminate their complaints in the same train of pious reflection. "How well," he says, "should my library be furnished, 'nisi obstat res angusta domi!'

"My lot forbids: nor circumscribes alone
My growing virtues, but my crimes confines."

Whether any virtues should have accompanied me in a more elevated station is uncertain; but that a number of vices of which my sphere is incapable would have been its attendants is unquestionable. The Supreme Wisdom has seen this meet; and Supreme Wisdom cannot err."

Even when prosecuting his favourite studies, Bruce is said to have been liable to that depression which is frequently the attendant of genius indeed, but in his case was also the precursor of a fatal disease. In December 1764 he wrote to his friend Arnot,—"I am in health, excepting a kind of settled melancholy, for which I cannot account, that has seized on my spirits." Such seems to have been the first imperfect announcement of his consciousness that all was not well with him. It would be a mournful task, if it were possible, to trace the gradations by which his apprehensions strengthened and grew into that certainty which only two years after this produced the *Elegy*, in which so pathetically, yet so calmly, he anticipates his own death. In these years are understood to have been written the greater part of his poems which have been given to the public. He spent the winters at college, and the summer in earning a small pittance by teaching a school, first at Gairny Bridge, and afterwards at Forrest Mill, near Alloa. In this latter place he had hoped to be happy, but was not—having, he confesses, been too sanguine in his expectations. He wrote here *Lochleven*, the longest of his poems, which closes with these affecting lines:—

"Thus sung the youth, amid unfertile wilds
And nameless deserts, unpeopled ground!
Far from his friends he stray'd, recording thus
The dear remembrance of his native fields,
To cheer the tedious night, while slow disease
Prey'd on his pining vitals, and the blasts
Of dark December shook his humble cot."

A letter to Mr. Pearson, written in the same month in which he finished this poem, affords a still closer and more touching view of the struggle which he now maintained against growing disease, the want of comforts and of friendly consolation. "I lead a melancholy kind of life," he says, "in this place. I am not fond of company; but it is not good that a man be still alone: and here I can have no com-

pany but what is worse than solitude. If I had not a lively imagination, I believe I should fall into a state of stupidity and delirium. I have some evening scholars; the attending on whom, though few, so fatigues me, that the rest of the night I am quite dull and low-spirited. Yet I have some lucid intervals, in the time of which I can study pretty well."

"In the autumn of 1766," says Dr. Anderson, "his constitution—which was ill calculated to encounter the austerities of his native climate, the exertions of daily labour, and the rigid frugality of humble life—began visibly to decline. Towards the end of the year, his ill health, aggravated by the indigence of his situation, and the want of those comforts and conveniences which might have fostered a delicate frame to maturity and length of days, terminated in a deep consumption. During the winter he quitted his employment at Forrest Mill, and with it all hopes of life, and returned to his native village to receive those attentions and consolations which his situation required, from the anxiety of parental affection and the sympathy of friendship. Convinced of the hopeless nature of his disease, and feeling himself every day declining, he contemplated the approaches of death with calmness and resignation, and continued at intervals to compose verses and to correspond with his friends."

Bruce lingered through the winter, and in spring wrote that elegy, "the latter part of which," says Logan, "is wrought up into the most passionate strains of the true pathetic, and is not perhaps inferior to any poetry in any language." How truly this is said there are few that do not know; but they who have read it often will not be fatigued by reading it again.

"Now Spring returns; but not to me returns
The vernal joy my better years had known;
Dim in my breast life's dying taper burns,
And all the joys of life with health are flown.

"Starting and shivering in th' inconstant wind,
Meagre and pale, the ghost of what I was,
Beneath some blasted tree I lie reclined,
And count the silent moments as they pass:

"The winged moments, whose unstaying speed
No art can stop or in their course arrest;
Whose flight shall shortly count me with the dead,
And lay me down in peace with them that rest.

"Oft morning dreams presage approaching fate;
And morning dreams, as poets tell, are true;
Led by pale ghosts, I enter death's dark gate,
And bid the realms of light and life adieu.

"I hear the helpless wail, the shriek of woe;
I see the muddy wave, the dreary shore,
The sluggish streams that slowly creep below,
Which mortals visit and return no more.

"Farewell, ye blooming fields! ye cheerful plains!
Enough for me the churchyard's lonely mound,
Where melancholy with still silence reigns,
And the rank grass waves o'er the cheerless ground.

"There let me wander at the close of eve,
When sleep sits dewy on the labourer's eyes,
The world and its busy follies leave,
And talk with wisdom where my Daphnis lies.

"There let me sleep forgotten in the clay,
When death shall shut these weary aching eyes,
Rest in the hope of an eternal day,
Till the long night is gone, and the last morn arise."

These were the last verses finished by the author. His strength was wasted gradually away, and he died on the 6th of July, 1767, in the twenty-first year of his age. What he might have accomplished had longer years been assigned to him, it were needless to conjecture; but of all the sons of genius cut off by an early death, there is none whose fate excites so tender a regret. His claims to admiration

are great without any counteracting circumstance. "Nothing," says Lord Craig, after a brief allusion to the leading facts of Bruce's life—"Nothing, methinks, has more the power of awakening benevolence than the consideration of genius thus depressed by situation, suffered to pine in obscurity, and sometimes, as in the case of this unfortunate young man, to perish, it may be, for want of those comforts and conveniences which might have fostered a delicacy of frame or of mind ill calculated to bear the hardships which poverty lays on both. For my own part, I never pass the place (a little hamlet skirted with old ash-trees, about two miles on this side of Kinross) where Michael Bruce resided—I never look on his dwelling (a small thatched house distinguished from the cottages of the other inhabitants only by a sashed window at the end, instead of a lattice, fringed with a honeysuckle plant which the poor youth had trained around it)—I never find myself in that spot but I stop my horse involuntarily, and looking on the window, which the honeysuckle has now almost covered, in the dream of the moment, I picture out a figure for the gentle tenant of the mansion. I wish—and my heart swells while I do so—that he were alive, and that I were a great man to have the luxury of visiting him there, and of bidding him be happy."

Three years after Bruce's death his poems were given to the world by Logan, who unfortunately mingled with them some of his own, and never gave any explanation by which these might be distinguished. This led to a controversy between their respective friends in regard to the authorship of a few pieces, into which it would be unprofitable to enter here, as the fame of Bruce is no way affected whichever way the dispute be decided. The attention of the public having been called to the volume by Lord Craig, in the thirty-sixth number of the *Mirror*, in 1779, a second edition was published in 1784; Dr. Anderson gave Bruce's works a place in his *Collection of British Poets*, and prefixed to them a memoir from which are derived the materials of the present sketch; and finally the unwearied benevolence of Principal Baird brought forward an edition in 1807 by subscription, for the benefit of the poet's mother. He could not restore her son to be the support of her old age, but made all that remained of him contribute to that end—one of the numberless deeds which now reflect honour upon his memory.

Perhaps Bruce's fame as a poet has been injured by the sympathy which his premature death excited, and by the benevolent purpose which recommended the latest edition of his works to public patronage. Pity and benevolence are strong emotions; and the mind is commonly content with one strong emotion at a time; he who purchased a book, that he might promote the comfort of the author's mother procured for himself, in the mere payment of the price, a pleasure more substantial than could be derived from the contemplation of agreeable ideas; and he would either be satisfied with it and go no farther, or carry it with him into the perusal of the book, the beauties of which would fail to produce the same effect as if they had found his mind unoccupied. But these poems, nevertheless, display talents of the first order. Logan says of them that, "if images of nature that are beautiful and new; if sentiments warm from the heart, interesting and pathetic; if a style chaste with ornament, and elegant with simplicity; if these, and many other beauties of nature and of art, are allowed to constitute true poetic merit, they will stand high in the judgment of men of taste." There is no part of this eulogy overstrained; but perhaps the most remarkable points in the compositions of Bruce,

considering his extreme youth, are the grace of his expression and melody of his verses. Flashes of brilliant thought we may look for in opening genius, but we rarely meet with a sustained polish. The reader who glances but casually into these poems will be surprised to find how many of those familiar phrases recommended to universal use by their beauty of thought and felicitous diction which every one quotes, while no one knows whence they are taken—we owe to Michael Bruce. As to his larger merits the reader may judge from the union of majesty with tenderness which characterizes the elegy already quoted. The poem of *Lochleven* affords many passages worthy of higher names. We know not in the compass of English poetry a more beautiful image than is presented in the following lines:—

“Behold the village rise
In rural pride, ’mong intermingled trees!
Above whose aged tops the joyful swains,
At eventide descending from the hill,
With eye enamour’d mark the many wreaths
Of pillar’d smoke, high curling to the clouds.”

BRUCE, ROBERT, Earl of Carrick, afterwards King of Scots, and the most heroic as well as the most patriotic monarch which Scotland ever produced, was born on the 21st of March, 1274. He was the grandson of Robert Bruce, lord of Annandale, who in 1291 contested the right to the crown with John Baliol. The events which followed upon the decision of that momentous question are elsewhere detailed to the reader (in the preceding life of John Baliol, and the subsequent one of William Wallace); it is therefore unnecessary to advert to them in this place, unless in so far as they have reference to the family of Bruce, and in particular to the illustrious individual now under notice.

Upon the decision of Edward I. in favour of Baliol, the grandfather of King Robert, being possessed of extensive estates in the north of England, resigned the lordship of Annandale to his eldest son, on purpose, it may be supposed, to evade the humiliating necessity of doing homage to his successful rival. No other particular regarding him is known: he died at the family residence of Lochmaben, not long after, at the advanced age of eighty-five.

Robert Bruce, the son of the competitor and father of King Robert, became possessed, by his last event, of the English as well as of the Scottish estates belonging to his family. He had also acquired, in right of his wife, the heiress of Carrick, the earldom of that name,¹ and, in every respect, might justly be

considered one of the most powerful barons in the kingdom. Either from disinclination, or, as some have suspected, from motives of policy, Robert Bruce, the second of the name, early avoided taking any share in the affairs of Scotland. When his son was yet a minor, he made resignation to him of the earldom of Carrick, and shortly thereafter, retiring into England, left the administration of his ancient patrimony of Annandale in the same hands. During the ill-concerted and disastrous revolt of Baliol in 1296, the Bruces maintained their allegiance to the English king. The lordship of Annandale was, in consequence, hastily declared forfeited, and the rich inheritance bestowed by Baliol upon John Comyn, Earl of Buchan, who immediately seized upon and occupied the castle of Lochmaben; an injury which, there is reason to believe, the young Earl of Carrick, long after, but too well remembered, and fatally repaid.

It is asserted that Edward, in order to gain securely the fidelity and assistance of the lord of Annandale and his son, had promised to bestow upon the former the kingdom of which Baliol was now to be dispossessed. It is not probable that the English monarch ever seriously entertained such an intention, and still less likely, if he did, that in the flush of successful conquest he should be capable of putting it in execution. After the decisive battle of Dunbar, Bruce reminded Edward of his promise: “Have I no other business,” was the contemptuous reply, “but to conquer kingdoms for you?” The elder Bruce once more retired to his estate in England, where he passed the remainder of his days; and the Earl of Carrick was commissioned to receive in the name of the English king the homage of his own and his father’s vassals. So unpromising were, in their commencement, the fortunes of him upon whom the fortunes of Scotland were finally to depend.

In the Scots parliament which Edward assembled at Berwick for the settlement of his new conquest, he received the homage of great numbers of the clergy and laity, and among the rest of the Earl of Carrick, who probably dared not incur even the suspicion of the English king. His large estates extending between the firths of Clyde and Solway, and bordering upon England; the number of his connections and dependants, rendered still more formidable by the discomfiture and depression of the rival family; to say nothing of the personal talents of the young earl himself, must have rendered him liable to the jealous scrutiny of so politic a sovereign as Edward. On the other hand, the residence of the elder Bruce in England, and the great property possessed by the family in that kingdom, were an actual guarantee in the hands of Edward of the Bruces’ loyalty; nor is it unlikely that he would be swayed by a wise policy in attaching to himself that party in the state from whom he had most to fear. Forbearance on the one side, and submissiveness on the other, were probably dictated to each by opposite though equally strong convictions of expediency.

During the noble stand of Wallace against the national defection, the Earl of Carrick, though he remained inactive, was not overlooked by the jealous eye of the English government. The Bishop of Carlisle and other barons, to whom the peace of the western districts was committed, became suspicious of his fidelity, and summoned him to appear before them, when he made oath on the sacred host and the sword of St. Thomas, to be faithful and vigilant in the service of Edward. To evince his sincerity, he immediately after laid waste the lands of Sir William Douglas, carrying the wife and family of that knight prisoners into Annandale. Probably

¹ The circumstances attending this alliance, related by Mr. Tytler, were of a romantic and singular description. “It appears that a short time after his return from the crusade, Bruce was riding through the beautiful domains of Turnberry Castle, the property of the widowed Countess of Carrick; who, in consequence of the death of her husband, had become a ward of the crown. The noble baron, however, if we may believe an ancient historian, cannot be accused of having visited Turnberry with any design of throwing himself in the way of the heiress of Carrick; and indeed any such idea in those days of jealous wardship would have been highly dangerous. It happened, however, that the lady herself, whose ardent and impetuous temper was not much in love with the seclusion of a feudal castle, had come out to take the diversion of the chase, accompanied by her women, huntsmen, and falconers; and this gay cavalcade came suddenly upon Bruce, as he pursued his way through the forest, alone and unarmed. The knight would have spurred his horse forward, and avoided the encounter, but he found himself surrounded by the attendants; and the countess herself riding up, and with gentle violence taking hold of his horse’s reins, reproached him in so sweet a tone for his want of gallantry in flying from a lady’s castle, that Bruce, enamoured of her beauty, forgot the risk which he ran, and suffered himself to be led away in a kind of triumph to Turnberry. He here remained for fifteen days, and the adventure concluded, as might have been anticipated, by his privately espousing the youthful countess without having obtained the concurrence of the king, or of any of her relations.”

this enterprise was merely a pretext for assembling his military retainers; for he had no sooner collected them than he abandoned the English interests, and joined the army of the Scots; alleging, in vindication of his conduct, that his late solemn oath had been extorted from him by force, and that the pope would, he doubted not, absolve him from its observance. Bruce did not remain long faithful to his new allies. A few months after, at the capitulation of Irvine, he made his peace with Edward, giving what sureties were required for his future loyalty.

The signal success achieved by the Scots at Stirling, induced Bruce once more to join the national cause; but the Comyns, now the principal rivals of his family for the vacant throne, being at the same time opposed to Edward, he seems to have prudently avoided taking any active share in the contest. Refusing to join the army, he shut himself up in Ayr castle, by this means ostensibly preserving the communication open between Galloway and the western Highlands. On the approach of Edward into the west, after the battle of Falkirk, the earl, after destroying the fortress, found it necessary to retire. Displeased as the English king had reason to be with the vacillating conduct of Bruce at this juncture, he did not chastise it otherwise than by taking temporary possession of Lochmaben castle, the fortified patrimonial inheritance of the family. Among the confiscations of property which followed, Annandale and Carrick remained unalienated, a favour which the younger Bruce probably owed to the fidelity and services of his father in the English cause.

In the year 1299, not long after the fatal issue of the battle of Falkirk, we find the Earl of Carrick associated with John Comyn, the younger of Badenoch, in the regency of Scotland. The motives of Bruce in thus leaguering himself with a rival, with whom he never hitherto had acted in concert, have been variously represented, and the fact itself has even been called in question. The consciousness of having lost the confidence of the English king, and a desire, mutually entertained, to destroy the authority of Wallace, which but too well succeeded, could not but influence powerfully the conduct of both parties. This object accomplished, Bruce seems to have once more resumed his inactive course of policy, relinquishing to the, perhaps, less wary Comyn, the direction of the hazardous power which he seemed so willing to wield. In the following year Edward again invaded Scotland, laid waste the districts of Annandale and Carrick, and once more possessed himself of the castle of Lochmaben. Bruce, though on this occasion he was almost the only sufferer, cautiously avoided, by any act of retaliation or effective co-operation with Comyn, to widen irremediably the breach with Edward; and we find, that prior to the advantage gained by his coadjutor at Rosslyn, he had returned once more to the interests of the English party. The victorious campaign of Edward, which, in 1304, ended in a more complete subjugation of Scotland than he had hitherto been able to effect, justified the prudent foresight, though it tarnished the patriotic fame, of the Earl of Carrick. His lukewarmness in the cause of the regency, and timely defalcation from it, procured his pardon upon easy terms, and seemed to restore to him, in a great measure, the confidence of Edward, with which he had so repeatedly dared to trifle. His father, the lord of Annandale dying at this critical time, the young Bruce was allowed to inherit the whole extensive estates of his family in both kingdoms; and so unequivocally, indeed, had he recovered the favour of the English monarch, that he was held worthy of

advising and aiding in the settlement of Scotland as a province under the rule of England. Comyn, who had acted throughout with sincerity and constancy in the trust reposed in him, and whose submission had been a matter of necessity, was subjected to a heavy fine, and fell, in proportion to his rival's elevation, in the confidence and estimation of the king.

The versatility of Bruce's conduct during these various changes and reverses, has been variously commented upon by historians, as they have been led to consider it in a moral or political point of view; and, indeed, in whatever way it may be explained, it forms a singular contrast to the honourable, bold, and undeviating career of his after-life. In extenuation of such obvious derelictions from principle and consistency, we must take into account the effects of peculiar circumstances upon a mind that has been irresistibly devoted to the attainment of some great and engrossing object. That natural irresoluteness, too, by which the boldest spirit may be beset, while meditating the decisive plunge into a hazardous enterprise, may cause a seeming vacillation of purpose, arising more from a deep sense of the importance of the venture, than from fear of the consequences. That Bruce should early entertain a persuasion that his family were justly entitled to the throne was every way natural, and we have already noticed, that hopes of their actually attaining to it were held out by Edward himself to the lord of Annandale. Nurtured and strengthened in such feeling, the young aspirant to royalty could not be expected to entertain attachment to the house of Baliol; and must have regarded with still greater aversion the sovereignty usurped by England over the rights and pretensions of all his race. During the struggle, therefore, of those contending interests—the independence of Scotland under Baliol, or its subjugation under Edward—he necessarily remained more in the situation of a neutral, than an active partisan; the success of either party involving in an almost indifferent degree the high claims, and, it might be, the existing fortunes of his house.

Taking these considerations into account, there is little difficulty in reconciling to itself the line of conduct which Bruce had hitherto pursued. By joining heartily with neither party, he prudently avoided committing the fortunes of his family to the hazard of utter destruction, and his right and influence could give, upon any emergency, a necessary and required preponderance to either side. He must have foreseen, too, with secret satisfaction, the consequences which would result to his own advantage from a contest in which the strength and resources of his rivals were mutually wasted, whilst his own energies remained entire, and ready on any favourable opportunity to be called decisively into action. That these were not exerted sooner, the existence of his father down to this period, and his submission to the English government, may suggest a sufficient reason; and his own accession to the regency, in the name of the deposed Baliol, was a circumstance which could not but affect unfavourably, during its continuance, the assertion of his pretensions.

Meantime, while Bruce outwardly maintained the semblance of loyalty to Edward, he was not idle in secretly advancing the objects of his own ambition; and when actually engaged in assisting Edward in the settlement of the Scottish government, he entered into a secret bond of association with Lamberton, Bishop of St. Andrews, whereby the parties became bound to aid each other against all persons whatever, and not to undertake any business of moment unless by mutual advice. No measure on the part of Bruce could be more politic than that of enlisting the

church in his cause, and the reader may afterwards have occasion to remark that he owed his success more to the firm adherence of churchmen than to all the efforts of the nobility. Lamberton and his colleagues were more alarmed at the prospect of being subjected to the spiritual supremacy of York or Canterbury, than concerned for the temporal subjugation of their country; and thus, in the minds of the national clergy, the independency of the church became intimately associated with the more general cause of popular freedom. In addition to the spiritual power of Lamberton, the aid which he could furnish by calling out the military retainers upon the church lands was far from inconsiderable. Though we are not informed of any other similar contract to the above having been entered into between Bruce and his partisans, there can be little doubt that this was not the only one, and that he neglected no expedient to promote his enterprise. Notwithstanding, however, all the caution displayed in these preparatory measures, the better genius of Bruce seems to have deserted him when its guidance was most required.

Before entering upon this important event, it will be necessary to state the relative position of the two great parties in the kingdom as opposed to each other. John Baliol, supposing his title to have been well founded, had repeatedly renounced all pretensions to the crown of Scotland, and had for several years remained a voluntary exile in France. He was to be considered, therefore, as having not only formally, but virtually, forfeited all claim to the kingdom. His son Edward was at that time a minor and a captive. John Comyn, commonly called the Red Comyn, was the son of Marjory, the sister of Baliol, and, setting Baliol aside, was the heir of the pretensions of their common ancestor. As regent of Scotland and leader of her armies, Comyn had maintained for many years the unequal contest with Edward; and he had been the last to lay down his arms and accept conditions of peace. Though the terms of his submission had been rigorous, he was yet left in possession of large estates, a numerous vassalage, and, what in that warlike age was of consequence, an approved character for courage and conduct in the field.

Plausible as were Comyn's claims to the crown, and powerfully as these might have been supported against England, there was little likelihood, that in a competition with Bruce, they could ever finally have prevailed. That family, according to the ancient usage of the kingdom, ought to have been preferred originally to that of Baliol; and this fact, generally known and acknowledged as it could not fail to be, would, had they chosen to take advantage of it, have rendered their cause, at any time, a popular one. The award of Edward, from the consequences that followed it, had become odious to the nation; and the pusillanimity and misfortunes of the abdicated king would leave, however undeservedly, their stigma upon his race. It was a curious enough illustration of the deep-rooted existence of such a feeling, that, nearly a century afterwards, a King of Scotland who happened to possess the same unfortunate name of John, saw fit upon his coronation to change it for another, less ominous of evil in the recollections of his subjects. We have seen that Bruce at this crisis was possessed of those advantages unimpared, of which the other, in the late struggle, had been, in a great measure, deprived; and there is reason to believe that Comyn, whose conduct had been consistent and honourable, felt himself injured and indignant at a preference which he might suppose his rival had unworthily earned.

Thus, under impressions of wrong, and filled with jealous apprehensions, the Red Comyn might be presumed willing, upon any inviting occasion, to treat Bruce as an enemy whom it was his interest to circumvent or destroy.

The league into which Bruce had entered with Lamberton, and perhaps other transactions of a similar nature, were not so secretly managed, as to be unsuspected; and this is said to have led to an important conference between these rivals on the subject of their mutual pretensions. At this meeting, Bruce, after describing the miserable effects of the enmity between their different families, by which they themselves were not only deprived of station, but their country of freedom, proposed, as the best means of remedy, that they should henceforward enter into a good understanding with each other. "Support my title to the crown," he is represented to have said, "and I will give you my lands; or, give me your lands and I will support your claim." Comyn agreed to waive his right, and accept the lands; and the conditions having been drawn up in form of indenture, were sealed by both parties, and confirmed by their mutual oaths of fidelity and secrecy.

Bruce shortly afterwards repaired to the English court, and whilst there, Comyn, probably from the design of ruining a rival whom he secretly feared and detested, revealed the conspiracy to Edward. The king, upon receiving this information, thought fit to dissemble his belief in its veracity. With a shrewdness and decision, however, peculiar to his character, he frankly questioned Bruce upon the truth of Comyn's accusation, adducing at the same time the letters and documents which he had received as evidences of the fact. The earl, much as he might feel staggered at the sudden disclosure of Comyn's treachery, had recollection enough to penetrate the immediate object of the king, and presence of mind to baffle it. Though taken so completely by surprise, he betrayed no outward signs of guilt, and succeeded by his judicious answers in re-establishing to all appearance the confidence of the crafty monarch, who had, indeed, his reasons for this seeming reliance, but who all along was too suspicious to be convinced. He had, in fact, determined upon the earl's ruin; and, having one evening drank freely, was indiscreet enough to disclose his intentions. The Earl of Gloucester, a kinsman of Bruce, chanced either to be present, or to have early notice of his friend's danger, and, anxious to save him, yet not daring to compromise his own safety, he sent to him a pair of gilded spurs and a few pieces of money, as if he had borrowed them from him the day before. Danger is an acute interpreter, and Bruce divined that the counsel thus symbolically communicated warned him to instant flight. Taking his measures, therefore, with much privacy, and accompanied by his secretary and one groom, he set out for Scotland. On approaching the western marches, they encountered a messenger on foot, whose deportment struck them as suspicious. He was searched, and proved to be an emissary sent by Comyn with letters to the King of England. The man was killed upon the spot; and Bruce, with these proofs of the perfidy of his rival, pressed forward to his castle of Lochmaben, which he is reported to have reached on the fifth day after his precipitate flight from London.

These events occurred in the month of February, 1306; at which time, according to a regulation of the new government, certain English judges were holding their courts at Dumfries. Thither Bruce immediately repaired, and finding Comyn in the town, requested a private interview with him, which

was accorded; but, either from some inward doubts on the one side, or a desire to give assurance of safety on the other, the meeting took place near the high altar in the convent of the Minorite Friars. Bruce is said to have here passionately reproached Comyn for his treachery, to which the other answered by flatly giving him the lie. The words were scarcely uttered, when the earl, giving vent to the fury which he had hitherto restrained, drew his dagger and stabbed, but not mortally, his unguarded opponent. Instantly hastening from the church, he called to his attendants for his horse. Lindsay and Kirkpatrick, by whom he had been accompanied, seeing him pale and agitated, anxiously inquired the cause. "I doubt I have slain Comyn," replied the earl. "You doubt," cried Kirkpatrick fiercely, "I see *mak siclier*;" and rushing into the sanctuary, he found Comyn still alive, but helpless and bleeding, upon the steps of the high altar. The dying victim was ruthlessly despatched on the sacred spot; and, almost at the same moment, Sir Robert Comyn, the uncle, entering the convent upon the noise and alarm of the scuffle, shared his fate. The tumult had now become general throughout the town; and the judges who held their court in a hall of the castle, not knowing what to fear, but believing their lives to be in danger, hastily barricaded the doors. Bruce, assembling his followers, surrounded the castle, and threatening to force an entrance with fire, obliged those within to surrender, and permitted them to depart in safety from Scotland.

That this fatal event fell out in the reckless passion of the moment, there can be no doubt. Goaded as he had been to desperation by the ruin impending over him, and even insulted personally by the man who had placed him in such jeopardy, Bruce dared hardly, in that age of superstition, to have committed an act of sacrilegious murder. In the imperfectly arranged state of his designs, without concert among his friends, or preparation for defence, the assassination of the first noble in the land, even without its peculiar aggravations, could not but have threatened the fortune of his cause with a brief and fatal issue. He knew, himself, that the die of his future life was now cast; and that his only alternative was to be a fugitive or a king. Without hesitation, he at once determined to assert his claim to the Scottish crown.

When Bruce thus adopted a desperate chance of extrication and future honour, he had not a single fortress at his command besides those two patrimonial ones of Lochmaben and Kildrummie; the latter situated in Aberdeenshire, at too great a distance from the scene of action to prove of service. He had prepared no system of offensive warfare, nor did it seem that, in the beginning, he should be even able to maintain himself on the defensive. Three earls only, those of Lennox, Errol, and Athole, joined his standard; Randolph, the nephew of Bruce, who afterwards became the renowned Earl of Moray; Christopher of Seton, his brother-in-law; Sir James Douglas, whose fate became afterwards so interestingly associated with that of his master; and about ten other barons then of little note, but who were destined to lay the foundations of some of the most honourable families in the kingdom, constituted, with the brothers of the royal adventurer, the almost sole power against which such fearful odds were presently to be directed—the revenge of the widely-connected house of Comyn, the overwhelming force of England, and the fulminations of the church. Without other resource than his own undaunted resolution, and the untried fidelity and courage of his little band, Bruce ascended the throne of his ancestors, at Scone,

on the 27th day of March, 1306. The coronation was performed with what state the exigency of the moment permitted. The Bishop of Glasgow supplied from his own wardrobe the robes in which Robert was arrayed on the occasion; and a slight coronet of gold was made to serve in absence of the hereditary crown, which, along with the other symbols of royalty, had been carried off by Edward into England. A banner, wrought with the arms of Baliol, was delivered by the Bishop of Glasgow to the new king, beneath which he received the homage of the earls and knights by whom he was attended. The Earls of Fife, from a remote antiquity, had possessed the privilege of crowning the kings of Scotland; but at this time, Duncan, the representative of that family, favoured the English interest. His sister, however, the Countess of Buchan, with a boldness characteristic of the days of chivalry, secretly repaired to Scone, and asserted the pretensions of her ancestors. It is not unlikely that this circumstance added to the popular interest felt for the young sovereign. The crown was a second time placed on the head of Bruce by the hands of the countess; who was afterwards doomed to suffer, through a long series of insult and oppression, for the patriotic act which has preserved her name to posterity.

Edward resided with his court at Winchester when tidings of the murder of Comyn and the revolt of Bruce reached his ears. That monarch, whose long career of successful conquest was once again to be endangered, had reached that period of life when peace and tranquillity even to the most indomitable become not only desirable but coveted blessings. The great natural strength of his constitution had, besides, ill withstood the demands which long military service and the violent cravings of ambition had made upon it. He was become unwieldy bulk, and so infirm in his limbs as to be unable to mount on horseback. Yet the spirit which had so strongly actuated the victor on former occasions did not now desert him. He immediately despatched a message to the pope, demanding, in aid of his own temporal efforts, the assistant thunder of the holy see, a requisition with which Clement V., who had formerly been the subject of Edward, readily complied. The sentence of excommunication was denounced against Bruce and all his adherents, and their possessions placed under the dreaded ban of interdict. The garrison towns of Berwick and Carlisle were strengthened; and the Earl of Pembroke, who was appointed guardian, was ordered to proceed against the rebels in Scotland, at the head of a small army, hastily collected, for the occasion. Those were but preparatory measures. Upon Edward's arrival in London, he conferred knighthood upon his son the Prince of Wales, and nearly three hundred young men selected from families of rank throughout the kingdom; and conducted the ceremony with a pomp well calculated to rouse the martial ardour of his subjects. At a splendid banquet to which his nobility and the new-made knights were invited, the aged king is recorded to have made a solemn vow to the God of heaven, that he would execute severe vengeance upon Bruce for his daring outrage against God and his church; declaring, that when he had performed this duty, he would never more unsheath his sword against a Christian enemy; but should devote the rest of his days to waging war against the Saracens for the recovery of the Holy Land, thence never to return. Addressing his son, he made him promise, that, should he die before the accomplishment of his revenge, he should carry his body with the army, and not commit it to the

earth, until a complete victory over his enemies should be obtained.

Pembroke, the English guardian, marching his small army upon Perth, a walled and strongly fortified town, established there his head-quarters. Bruce, during the short interval since his coronation, had not been altogether unsuccessful in recruiting the numbers of his followers; nor did he think it prudent to delay engaging this portion of the English forces, greatly superior as they were, in every respect, to his own. On drawing near Perth, he sent a challenge, according to the chivalrous practice of the age, defying the English commander to battle in the open field. Pembroke returned for answer, that the day was too far spent, but that he would be ready to join battle on the morrow. Satisfied with this assurance, Robert drew off his army to the neighbouring wood of Methven, where he encamped for the night; parties were dispersed in search of provisions, and the others, throwing aside their armour, made the necessary arrangements for repose. By a very culpable neglect, or a most unwarrantable reliance on the promise of the English earl, the customary watches against surprise were either altogether omitted, or very careless in their duty. Pembroke being made aware of the negligent posture of the Scottish troops, drew out his forces from Perth, and gaining the unguarded encampment, succeeded in throwing the whole body into irremediable confusion. The Scots made but a feeble resistance, and were soon routed and dispersed. Philip de Mowbray is said to have unhorsed Bruce, whom he seized, calling aloud that he had got the new-made king; when Robert was gallantly rescued from his perilous situation by Sir Christopher Seton, his brother-in-law. Another account affirms that Robert was thrice unhorsed in the conflict, and thrice remounted by Sir Simon Frazer. So desperate, indeed, were the personal risks of the king on that disastrous night, that, for a time, being totally unsupported, he was made prisoner by John de Haliburton, a Scotsman in the English army, but who set him at liberty on discovering who he was.

To have sustained even a slight defeat at the present juncture would have proved incalculable injury to Bruce's cause: the miserable overthrow at Methven seemed to have terminated it for ever. Several of his truest and bravest friends were made prisoners, among whom were Haye, Barclay, Frazer, Inchmartin, Sommerville, and Randolph. With about 500 men, all that he was able to muster from the broken remains of his army, Bruce penetrated into the mountainous country of Athole. In this small, but attached band, he still numbered the Earls of Athole and Errol, Sir James Douglas, Sir Neil Campbell, and his own brave brothers, Edward and Nigel. Reduced to the condition of proscribed and hunted outlaws, they endured the extremity of hardships among the barren fastnesses to which they retreated for shelter. The season, it being then the middle of summer, rendered such a life, for a time, possible; but as the weather became less favourable, and their wants increased, they were constrained to descend into the low country of Aberdeenshire. Here Robert met with his queen and many other ladies who had fled thither for safety; and who, with an affectionate fortitude, resolved, in the company of their fathers and husbands, to brave the same evils with which they found them encompassed. The respite which the royal party here enjoyed was of brief duration. Learning that a superior body of English was advancing upon them, they were forced to leave the low country and take refuge in the mountainous district of Breadalbane. To these

savage retreats they were accompanied by the queen and the other ladies, and again had the royalists to sustain, under yet more distressing circumstances, the rigorous severity of their lot. Hunting and fishing were the precarious, though almost their only means of sustaining life; and the good Sir James Douglas is particularly noticed by the minute Barbour for his success in these pursuits, and his devoted zeal in procuring every possible comfort for his forlorn and helpless companions.

While the royalists thus avoided immediate peril from one quarter, by abiding in those natural strongholds, they almost inevitably came in contact with another. The lord of Lorn, upon the borders of whose territories they lay, was nearly connected by marriage with the family of the murdered Comyn; and, as might be expected, entertained an implacable hatred towards the Scottish king. Having early intelligence of the vicinity, numbers, and destitution of the fugitive royalists, this powerful baron collected a body of nearly a thousand men well acquainted with the country, and besetting the passes, obliged the king to come to battle in a narrow defile where the horse of the party were rather a hindrance than a help. Considerable loss was sustained on the king's side, and Sir James Douglas and De la Haye were both wounded. Bruce, dreading the total destruction of his followers, ordered a retreat; and himself taking post in the rear, by desperate courage, strength, and activity, succeeded in checking the fury of the pursuers, and in extricating his party. The place of this memorable contest is still pointed out, and remembered by the name of Dalry, or the king's field.

The almost incredible displays of personal prowess and address which Robert made on this occasion, are reported to have drawn forth the admiration even of his deadly enemies. In one of those repeated assaults which he was obliged to make in order to check the assailants, he was beset, all at once, by three armed antagonists. This occurred in a pass, formed by a loch on the one side, and a precipitous bank on the other, and so narrow as scarcely to allow two horses to ride abreast. One seized the king's horse by the bridle, but by a blow, which lopped off his arm, was almost instantly disabled. Another got hold of the rider's foot within the stirrup-iron with the purpose of unhorsing him; but the king, standing up in the stirrup, and urging his steed forward, dragged the unfortunate assailant to the ground. The third person leaped up behind him in hope of pinioning his arms and making him prisoner, or of despatching him with his dagger; but turning round, and exerting his utmost strength, Robert forced him forwards upon the horse's neck and slew him; after which he killed the helpless wretch who still dragged at his side. Barbour, the ancient authority by whom this deed of desperate valour is recorded, has contrived, whether intentionally or not, to throw an air of probability over it. The laird of Macgaughton, a follower of Lorn, we are told, was bold enough, in the presence of his chief, to express a generous admiration of the conduct of the king. Being upbraided for a liberality which seemed to imply a want of consideration for the lives and honour of his own men, he replied, "that he who had won the prize of chivalry, whether friend or foe, deserved to be spoken of with respect."

The danger which the royalist party had thus for the time escaped, the near approach of winter, during which the means of support could not be procured, and their almost certain destruction should they descend into the level country, induced the king to

give up all thoughts of keeping the field in the face of so many difficulties. The queen and ladies were put under the escort of the remaining cavalry; and the charge of conducting them to the strong castle of Kildrummie, committed to Nigel, the king's second brother, and the Earl of Athole. The parting was sorrowful on both sides; and Robert here took the last leave of his brother Nigel, who not long after fell a victim to the inexorable Edward.

Robert now resolved, with his few remaining followers, amounting to about 200 men, to force a passage into Cantyre, that thence he might cross over into the north of Ireland. At the banks of Lochlomond the progress of the party was interrupted. They dared not travel round the lower end of the lake, lest they should encounter the forces of Argyle; and until they should reach the friendly country of the Earl of Lennox, they could not, for a moment, consider themselves safe from the enemies who hung upon their rear. Douglas, after a long search for some means of conveyance, was fortunate enough to discover a small boat capable of carrying three persons, but so leaky and decayed, that there would be much danger in trusting to it. In this, which was their only resource, the king and Sir James were ferried over the lake. Some accomplished the passage by swimming; and the little boat went and returned until all the others were safely transported. The royalists, forlorn as their circumstances were, here felt themselves relieved from the disquietudes which had attended their late marches; and the king, while they were refreshing themselves, is said to have recited for their entertainment the story of the siege of Eglymor, from the romance of Ferembras.

It was here, while traversing the woods in search of food, that the king accidentally fell in with the Earl of Lennox, ignorant till then of the fate of his sovereign, of whom he had received no intelligence since the defeat at Methven. The meeting is said to have affected both, even to tears. By the earl's exertions the royal party were amply supplied with provisions, and were shortly after enabled to reach in safety the castle of Dunaverty in Cantyre, where they were hospitably received by Angus of Isla. Bruce remained no longer in this place than was necessary to recruit the strength and spirits of his companions. Sir Neil Campbell having provided a number of small vessels, the fugitive and now self-exiled king, accompanied by a few of his most faithful followers, passed over to the small island of Rachrin, on the north coast of Ireland, where they remained during the ensuing winter.

A miserable destiny awaited the friends and partisans whom Bruce had left in Scotland. Immediately after the rout at Methven, Edward issued a proclamation for a search after all those who had been in arms against the English government, and ordering them to be delivered up dead or alive. It was ordained that all who were at the slaughter of Comyn, or who had harboured the guilty persons or their accomplices, should be drawn and hanged; that all who were already taken, or might hereafter be taken in arms, and all who harboured them, should be hanged or beheaded; that those who had voluntarily surrendered themselves, should be imprisoned during the king's pleasure; and that all persons, whether of the ecclesiastical order or laymen, who had willingly espoused the cause of Bruce, or who had procured or exhorted the people of Scotland to rise in rebellion, should, upon conviction, be also imprisoned. With regard to the common people, a discretionary power of fining and ransoming them was committed to the guardian.

This ordinance was enforced with a rigour corresponding to its spirit, and the dread of Edward's vengeance became general throughout the kingdom. The castle of Kildrummie being threatened by the English forces in the north, Elizabeth, Bruce's queen, and Marjory his daughter, with the other ladies who had there taken refuge, to escape the hardships and dangers of a siege, fled to the sanctuary of St. Duthac at Tain in Ross-shire. The Earl of Ross violated the sanctuary, and making them prisoners, sent them into England. Certain knights and squires by whom they had been escorted, being taken at the same time, were put to death. The queen and her daughter, though doomed to experience a long captivity, appear to have been invariably treated with becoming respect. Isabella, Countess of Buchan, who had signalized her patriotism on the occasion of Robert's coronation, had a fate somewhat different. Unwilling to inflict a capital punishment, the English king had recourse to an ingenious expedient by which to satisfy his vengeance. She was ordered to be confined in a cage constructed in one of the towers of Berwick Castle; the cage bearing in shape the resemblance of a crown; and the countess was actually kept in this miserable duration for the remainder of her life. Mary, one of Bruce's sisters, was committed to a similar custody in one of the towers of Roxburgh Castle; and Christina, another sister, was confined in a convent. Lamberton, Bishop of St. Andrews, Wisheart, Bishop of Glasgow, and the abbot of Seone, who had openly assisted Robert's cause, owed their lives solely to the inviolability of the clerical character. Lamberton and the abbot of Seone were committed to close custody in England. Wisheart having been seized in armour, was, in that uncanonical garb, carried a prisoner to the castle of Nottingham, where he is said to have been confined in irons. Edward earnestly solicited the pope to have these rebellious ecclesiastics deposed—a request with which his holiness does not seem to have complied.

The castle of Kildrummie was besieged by the Earls of Lancaster and Hereford. Being a place of considerable strength, it might have defied the English army for a length of time, had not the treachery of one of the garrison, who set fire to the magazine of grain and provisions, constrained it to surrender at discretion. Nigel Bruce, by whom the castle had been defended, was carried prisoner to Berwick; where, being tried by a special commission, he was condemned, hanged, and afterwards beheaded. This miserable fate of the king's brother excited a deep and universal detestation among the Scots towards the unrelenting cruelty of Edward. Christopher Seton, the brother-in-law of Bruce, and Alexander Seton, suffered under a similar sentence, the one at Dumfries, and the other at Newcastle. The Earl of Athole, in attempting to make his escape by sea, was discovered and conducted to London; where he underwent the complicated punishment then commonly inflicted on traitors, being hanged till only half dead, beheaded, disembowelled, "and the trunk of his body burned to ashes before his own face." *He was not drawn*, that point of punishment being remitted. Edward, we are told, although then grievously sick, endured the pains of his disease with greater patience after hearing of the capture of the Earl of Athole. Simon Frazer of Olivar Castle, the friend and companion in arms of Wallace, being also taken at this time, suffered capitally at London, and his head being placed on the point of a lance, was set near to that of his old friend and leader. Along with this brave man was

likewise executed Herbert de Norham. Among so many persons of note, others of inferior distinction did not escape; and Edward might, indeed, be said by his tyranny to have even now provoked that popular reaction which would suffice for his own defeat. To complete the measure of Robert's misfortunes, he and all his adherents were solemnly excommunicated by the pope's legate at Carlisle. The lordship of Annandale was bestowed on the Earl of Hereford, the earldom of Carrick on Henry de Percy, and his English estates were disposed of in like manner. During this period Bruce was fortunately out of the reach and knowledge of his enemies in the solitary island of Rachrin. Fordun relates that a sort of ribald proclamation was made after him through the churches of Scotland, as lost, stolen, or strayed.

The approach of spring, and a seasonable supply of money from Christina of the Isles, again roused the activity of Robert. Sir James Douglas, with the permission of his master, first passed over to Arran; where, shortly after his landing, he surprised a party belonging to Brodick Castle, in the act of conveying provisions, arms, and clothing to that garrison. Here he was in a few days joined by the king, who arrived from Rachrin with a small fleet of thirty-three galleys. Having no intelligence of the enemy, a trusty person named Cuthbert was despatched by the king to the opposite shore of Carrick, with instructions to sound the dispositions of the people; and, if the occasion seemed favourable for a descent among them, to make a signal, at a day appointed, by lighting a fire upon an eminence near the castle of Turnberry. The country, as the messenger found, was fully possessed by the English; the castle of Turnberry in the hands of Percy, and occupied by a garrison of near three hundred men; the old vassals of Bruce dispirited or indifferent, and many of them hostile. Appearances seemed altogether so unfavourable, that Cuthbert resolved to return without making the signal agreed upon. Robert watched anxiously the opposite coast of Carrick, at the point from which it should become visible; and when noon had already passed, a fire was plainly discerned on the rising ground above Turnberry. Assured that this could be no other than the concerted signal, the king gave orders for the instant embarkation of his men, who amounted to about three hundred. It is reported that, while he was walking on the beach, during the preparations for putting to sea, the woman at whose house he had lodged requested an audience of him. Pretending to a knowledge of future events, she confidently predicted that he should soon be king of Scotland, but that he must expect to encounter many difficulties and dangers in the course of the war; and, confiding in the truth of her prediction, she sent her two sons along with him.

Towards evening they put to sea; and when night closed upon them, they were enabled to direct their course across the firth by the light of the beacon, which still continued to burn on the heights of Turnberry. On landing they were met by the messenger Cuthbert, with the unwelcome intelligence that there was no hope of assistance from the people of Carrick. "Traitor," cried Bruce, "why made you then the fire?" "I made no signal," replied the man, "but observing a fire upon the hill, I feared that it might deceive you, and I hastened hither to warn you from the coast." In such a perilous dilemma, Bruce hesitated upon the course he should adopt; but, urged by the precipitate spirit of his brother Edward, and yielding at length to the dictates of his own more considerate valour, he resolved to persevere in the enterprise.

The greater part of the English troops under Percy were carelessly cantoned in the town, situated at some little distance from the castle of Turnberry. Before morning their quarters were surprised, and nearly the whole body, amounting to about two hundred men, put to the sword. Percy and his garrison heard from the castle the uproar of the night attack; but, ignorant alike of the enemy and their numbers, they dared not attempt a rescue. Bruce made prize of a rich booty, amongst which were his own war-horses and household plate. When the news of this bold and successful enterprise became known, a detachment of above 1000 men, under the command of Roger St. John, were despatched from Ayr to the relief of Turnberry; and Robert, unable to oppose such a force, thought proper to retire into the mountainous parts of Carrick.

The king's brothers, Thomas and Alexander, had been, previously to Robert's departure from Rachrin, sent over into Ireland to procure assistance; and having succeeded in collecting about 700 men, they endeavoured to effect a landing at Lochryan in Galloway, intending from thence to march into the neighbouring district of Carrick. Macdowal, a powerful chieftain of Galloway, having hastily collected his vassals, attacked and routed the invading party; the two brothers of the king and Sir Reginald Crawford, all of them wounded, were made prisoners; and Malcolm Mackail, lord of Kentir, and two Irish reguli or chieftains, were slain. Macdowal cut off the heads of the principal persons who had fallen; and along with these bloody tokens of his triumph, presented his prisoners to King Edward, then residing at Carlisle. The two brothers and their associate, supposed by some to have been a near relation of Wallace, were ordered to immediate execution. This disaster, coupled as it was with the insured enmity of the Gallovidians, and the near approach of the English, rendered for a time the cause of Bruce entirely hopeless. His partisans either fell off or were allowed to disperse themselves, while he himself often wandered alone, or but slightly accompanied, among woods and morasses, relying on his own great personal prowess, or his intimate knowledge of that wild district, in which he had been brought up, or on the fidelity of some attached vassal of his family. Almost all the incidents relating to Bruce, at this period of his fortunes, partake strongly of the romantic; and were it not that the authority from which they are derived has been found to be generally correct, some of them might well be deemed fabulous, or grossly exaggerated. The perilous circumstances in which he was placed, and his undaunted courage, furnished of themselves ample scope for the realization of marvellous adventure; and these, because marvellous or exaggerated, ought not, on that account, to be altogether or too hastily rejected. One of those adventures, said to have befallen the king at this time, is so extraordinary that we cannot omit it.

While Robert was wandering among the fastnesses of Carrick, after the defeat of his Irish auxiliaries at Lochryan, his small army so reduced as not to amount to sixty men, the Gallovidians chanced to gain such intelligence of his situation as induced them to attempt his surprisal. They raised, for this purpose, a body of more than 200 men, and provided themselves with bloodhounds to track the fugitives. Notwithstanding the privacy of their arrangements, Bruce had notice of his danger, but knew not at what time to expect their attack. Towards night he withdrew his band to a position protected by a morass on the one side, and by a rivulet on the

other, which had only one narrow ford, over which the enemy must pass. Here, leaving his followers to their rest, the king, accompanied by two attendants, returned to the ford, and after listening for some time, he could at length distinguish the distant sound of a hound's questing, or that eager yell which the animal is known to make when urged on in the pursuit of its prey. Unwilling for this cause alone to disturb the repose of his fatigued followers, Robert determined, as it was a clear moonlight night, to ascertain more exactly the reality of the danger. He soon heard the voices of men urging the hound forward, and no longer doubtful, he despatched his two attendants to warn his men of the danger. The blood-hounds, true to their instinct, led the body of Gallovidians directly to the ford where the king stood, who then boldly determined, till succour should arrive, to defend the passage of the ford, which was the more possible, as, from its narrowness, only one assailant could pass over at a time. Seeing only a solitary individual posted on the opposite side to dispute their way, the foremost of the enemy rode boldly into the water; but in attempting to land, Bruce, with a thrust of his spear, laid him dead on the spot. The same fate awaited four of his companions, whose bodies became a sort of rampart of defence against the others, who fell back in some confusion. Ashamed that so many should be baffled by one man, they returned to the attack; but were so valiantly opposed, that the post was still maintained, when the loud shout of Robert's followers advancing to his rescue, warned the Gallovidians to retire, after sustaining in this unexampled combat the loss of fourteen men. The danger to which the king had exposed himself, and the great bravery he had manifested, roused the spirits of his party, who now began, with increasing numbers, to flock to his standard. Douglas, who had been successfully employed against the English in his own district of Douglasdale, also about this time joined the king with a reinforcement from the vassals of his family.

Pembroke the guardian, at the head of a considerable body, now took the field against Robert; and was joined by John of Lorn, with 800 Highlanders, men well calculated for that irregular kind of warfare which Bruce was obliged to adopt. Lorn is said to have had along with him a blood-hound which had once belonged to the king, and was so strongly attached to its old master, and familiar with his scent, that if once it got upon his track it would never part from it. These two bodies advanced separately, Pembroke carefully keeping to the low and open country, where his cavalry could act with effect; while Lorn by a circuitous route endeavoured to gain the rear of the king's party. The Highland chieftain so well succeeded in this manoeuvre, that before Robert was aware of his danger, he found himself environed by the two hostile bodies of troops, either of which was greatly superior to his own. In this emergency the king, having appointed a place of rendezvous, divided his men into three companies, and ordered them to retreat by different routes, that they might have the better chance of escape. Lorn, arriving at the place where the Scottish army had separated, set loose the blood-hound, which, falling upon the king's scent, led the pursuers immediately on his track. The king finding himself pursued, again subdivided his remaining party into three, but without effect, for the hound still kept true to the track of its former master. The case now appearing desperate, Robert ordered the remainder of his followers to disperse themselves; and, accompanied by only one person, endeavoured

by this last means to frustrate the pursuit. In this he was of course unsuccessful; and Lorn, who now saw the hound choose that direction which only two men had taken, knew certainly that one of these must be the king; and despatched five of his swiftest men after them with orders either to slay them, or delay their flight. Robert finding these men gaining hotly upon him, faced about, and with the aid of his companion slew them all. Lorn's men were now so close upon him that the king could perceive they were led on by a blood-hound. Fortunately, he and his companion had reached the near covert of a wood, situated in a valley through which ran a brook or rivulet. Taking advantage of this circumstance, Bruce and his attendant, before turning into any of the surrounding thickets, travelled in the stream so far as was necessary to destroy the strong scent upon which the hound had proceeded. The Highland chieftain, on arriving at the rivulet, here found that the hound had lost its scent; and aware of the difficulty of a further search, was compelled to quit the chase. By another account the escape of Bruce from the blood-hound is told thus: An archer who had kept near to the king in his flight, having discovered that by means of the hound Robert's course had been invariably tracked, stole into a thicket, and from thence despatched the animal with an arrow.

Bruce reached in safety the rendezvous of his party, after having narrowly escaped from the treachery of three men, by whom, however, his faithful companion was slain. The English, under the impression that the Scottish army was totally dispersed, neglected the necessary precautions; and the king, aware of their security, succeeded in surprising a body of 200, carelessly cantoned at some little distance from the main army, and put the greater part of them to the sword. Pembroke soon after retired towards the borders of England, but was not long in gaining such information as led him to hope the surprisal of the king. Approaching with great secrecy a certain wood in Glentruel, where Robert then lay, he was on the point of accomplishing his purpose, when the Scots, happily discovering their danger, rushed forth unexpectedly upon their assailants and put them to flight. Pembroke, upon this defeat, retreated with his army to Carlisle.

Robert, encouraged by these successes, now ventured down upon the low country, and soon reduced the districts of Kyle, Carrick, and Cunningham to his obedience. Sir Philip Mowbray having been despatched with 1000 men to make head against this rapid progress, was attacked at advantage by Douglas with so much spirit, that, after a loss of sixty men, his force was routed, himself narrowly escaping. Pembroke again determined to take the field in person, and with a strong body of cavalry advanced into Ayrshire, and came up with the army of Bruce on Loudon Hill. The Scottish king, though his forces were still greatly inferior in number, and consisted entirely of infantry, determined to give battle to the English on the spot. He had carefully selected his ground, and by strongly intrenching the flanks of his position, was a match for the numbers and cavalry of the enemy. His force amounted in all to about 600 spearmen; that of Pembroke was not less than 3000 well mounted and armed soldiery, displaying an imposing contrast to the small but unyielding mass opposed to them. Pembroke, dividing his army into two lines or divisions, ordered the attack to be commenced; and the van, with lances couched, advanced at full gallop to the charge. The Scots sustained the shock, a desperate conflict ensued, and the English van was at length driven

back upon the rear or second division. This decided the fortune of the day. The Scots were now the assailants, and the rear of the English, panic-struck and disheartened, gave way, and finally retreated. The rout became general; Pembroke's whole army was put to flight, a considerable number being slain in the battle and pursuit, and many made prisoners. The loss on the part of the Scots is said to have been extremely small.

Three days after the battle of Loudon Hill Bruce encountered and defeated Monthermar, and obliged him to take refuge in the castle of Ayr. He for some time blockaded this place, but retired at the approach of succours from England. These successes, though in themselves limited, proved of the utmost importance to Robert's cause, and gave it that stability which hitherto it had never attained. The death of Edward I. at this period was another event which could not but favourably affect the fortunes of Scotland, at the very moment when the whole force of England was collected for its invasion. That great monarch's resentment towards Bruce and his patriotic followers did not die with him. With his last breath he gave orders that his dead body should accompany the army into Scotland, and remain unburied until that country was totally subdued. Edward II. disregarded this injunction, and had the body of his father more becomingly disposed of in the royal sepulchre at Westminster.

Edward II., by his weak and obstinate disposition, was incapable of appreciating, far less of acting up to the dying injunctions of his heroic father. His utter disregard for these was, indeed, manifested in the very first act of his reign—that of recalling his unworthy favourite Piers Gaveston from exile, who with other minions of his own cast was from that moment to take the place of all the faithful and experienced ministers of the late king, and by this measure he laid an early foundation for the disgust and alienation of his English subjects. His management in regard to Scotland was equally unpropitious. After wasting much valuable time at Dumfries and Roxburgh in receiving the homage of the Scottish barons, he advanced as far as Cumnock in Ayrshire, from whence, without striking a blow, he retreated into England. A campaign so inglorious, after all the mighty preparation spent upon it, could not but have a happy effect upon the rising fortunes of the Scottish patriots, while it disheartened all in Scotland who from whatever cause favoured the English interest.

The English king had no sooner retired than Bruce invaded Galloway, and, wherever opposed, wasted the country with fire and sword. The fate of his two brothers, who had here fallen into the hands of the chieftain Macdowal, most probably influenced the king in this act of severe retribution. The Earl of Richmond, whom Edward had newly created guardian, was sent to oppose his progress, upon which Robert retired into the north of Scotland, leaving Sir James Douglas in the south for the purpose of reducing the forests of Selkirk and Jedburgh to obedience. The king, without encountering almost any resistance, overran great part of the north, seizing, in his progress, the castle of Inverness and many other fortified places, which he ordered to be entirely demolished. Returning southward, he was met by the Earl of Buchan at the head of a tumultuary body of Scots and English, whom, at the first charge, he put to flight. In the course of this expedition the king became affected with a grievous illness, which reduced his bodily and mental strength to that degree, that little hopes were entertained of his recovery. Ancient historians have attributed this

malady to the effects of the cold, famine, poor lodging, and hardships, to which he had been subjected ever since the defeat at Methven.

Buchan, encouraged by the king's illness, again assembled his numerous followers, and being joined by Mowbray, an English commander, came up with the king's forces, then strongly posted near Slaines, on the east coast of Aberdeenshire. The royalists avoided battle; and beginning to be straitened for provisions, retired in good order, first to Strathgogie, and afterwards to Inverury. By this time the violence of the king's disorder had abated, and he began by slow degrees to recover strength. Buchan, who still watched for an opportunity, advanced to Old Meldrum; and Sir David Brechin, who had joined himself to his party, came upon Inverury suddenly with a detachment of troops, cut off several of the royalists in the outskirts of the town, and retired without loss. This military bravado instantly roused the king; and, though too weak to mount on horseback without assistance, and supported by two men on each side of his saddle, he took the direction of his troops, and encountering the forces of Buchan, though much superior to his own, put them to flight. The agitation of spirits which Robert underwent on this occasion is said to have restored him to health.

About this time the castle of Aberdeen was surprised by the citizens, the garrison put to the sword, and the fortifications razed to the ground. A body of English having been collected for the purpose of chastising this bold exploit, they were spiritedly met on their march by the inhabitants, routed, and a considerable number taken prisoners, who were afterwards, says Boece, hanged upon gibbets around the town, as a terror to their companions. A person named Philip, the forester of Platane, having collected a small body of patriots, succeeded, about the same period, in taking the strong castle of Forfar by escalade. The English garrison were put to the sword, and the fortifications, by order of the king, destroyed. Many persons of note who had hitherto opposed Bruce, or who from prudential considerations had submitted to the domination of England, now openly espoused the cause of their country. Among the rest, Sir David Brechin, the king's nephew, upon the overthrow at Inverury, submitted himself to his uncle.

While Robert was thus successfully engaged in the north, his brother Edward invaded Galloway. He was opposed by Sir Ingram Umphraville and Sir John de St. John with about 1200 men. A bloody battle ensued at the Water of Cree, in which the English, after severe loss, were constrained to flee. Great slaughter was made in the pursuit, and the two commanders escaped with difficulty to the castle of Butel, on the sea-coast. Sir John retired into England, where, raising a force of 1500 men, he returned into Galloway in the hope of finding his victorious enemy unprepared. Edward Bruce, however, had notice of his movements, and with his characteristic valour or temerity, resolved to overreach the enemy in their own stratagem. Intrenching his infantry in a strong position in the line of march of the assailants, he himself, with fifty horsemen well harnessed, succeeded in gaining their rear, with the intent of falling unexpectedly upon them so soon as his intrenched camp should be assailed. Edward was favoured in this hazardous manœuvre by a mist so thick that no object could be discerned at the distance of a bowshot: but, before his design could be brought to bear, the vapours suddenly clearing away, left his small party fully discovered to the English. Retreat with any chance of safety was impossible, and to the reckless courage of their

leader no thought of retreat occurred. His fifty horsemen no sooner became visible to their astonished foes than they rushed furiously to the attack, and put them to rout. Thus successful in the field, Edward expelled the English garrisons, and reduced the whole district to the authority of his brother.

Douglas, after achieving many advantages in the south, among which the successive captures of his own castle in Douglasdale were the most remarkable, about this time surprised and made prisoners Alexander Stewart of Bonkil, and Thomas Randolph, the king's nephew. When Randolph, who, from the defeat at Methven, had adhered faithfully to the English interest, was brought before his sovereign, the king is reported to have said, "Nephew, you have been an apostate for a season; you must now be reconciled." "You require penance of me!" replied Randolph fiercely; "yourself rather ought to do penance. Since you challenged the King of England to war, you ought to have asserted your title in the open field, and not to have betaken yourself to cowardly ambushes." "That may be hereafter, and perchance ere long," the king calmly replied; "meanwhile, it is fitting that your proud words receive due chastisement, and that you be taught to know my right and your own duty." After this rebuke Randolph was ordered for a time into close confinement. This singular interview may have been preconcerted between the parties for the purpose of floaking under a show of restraint Randolph's true feelings in joining the cause of his royal relative. Certain it is, his confinement was of brief duration; and in all the after acts of his life he showed with how hearty a devotion he had entered on his new and more honourable field of enterprise.

Shortly after the rejunction of Douglas, Bruce carried his arms into the territory of Lorn, being now able to take vengeance on the proud chieftain who, after the defeat at Methven, had so nearly accomplished his destruction. To oppose this invasion the Lord of Lorn collected about 2000 men, whom he posted in ambuscade in a defile, having the high mountain of Ben Cruachan on the one side, and a precipice overhanging Loch Awe on the other. This pass was so narrow in some places as not to admit of two horsemen passing abreast. Robert, who had timely information of the manner in which this road was beset through which he must necessarily pass, detached one-half of his army, consisting entirely of light-armed troops and archers, under Douglas, with orders to make a circuit of the mountain, and so gain the high ground in the rear and flank of the enemy's position. He himself, with the rest of his troops, entered the pass, where they were soon attacked by the ambushment. This lasted not long; for the party of Douglas appearing on the heights immediately above them and in their rear, descended the mountain and fell upon them sword in hand, the king, at the same time, pressing upon them from the pass. The men of Lorn were defeated with great slaughter; and their chief, who had planned this unsuccessful ambush, after witnessing its miscarriage, soon after put to sea, and retired into England. Robert laid waste the whole district of Lorn; and gaining possession of Dunstaffnage, garrisoned it strongly with his own soldiers.

While Bruce and his partisans were thus successfully emancipating Scotland, and subduing the refractory spirit of some of their own nobility, everything was feeble and fluctuating in the councils of their enemies. In less than a year Edward changed or re-appointed the governors of Scotland six different times. Through the mediation of Philip, King of France, a short truce was finally agreed upon between

Edward and Robert; but infractions having been made on both sides, Bruce laid siege to the castle of Rutherglen. In February, 1310, a truce was once more agreed upon, notwithstanding which John de Segrave was appointed to the guardianship of Scotland on both sides of the Forth, and had the warlike power of the north of England placed at his disposal. It was early in the same year that the clergy of Scotland assembled in a provincial council, and issued a declaration to all the faithful, bearing that the Scottish nation, seeing the kingdom betrayed and enslaved, had assumed Robert Bruce for their king, and that the clergy had willingly done homage to him in that character.

During these negotiations hostilities were never entirely laid aside. The advantages of the warfare, however, were invariably on the side of Bruce, who was now preparing to attack Perth, at that time esteemed the capital of Scotland; and roused to activity by this danger, Edward made preparations for its immediate defence. The whole military array of England was ordered to meet the king at Berwick; but the English nobles, disgusted with his government, and detesting his favourite Gaveston, repaired unwillingly to the royal standard. Towards the end of autumn the English commenced their march, and directing their course through the forest of Selkirk to Biggar, are said to have thence penetrated as far as Renfrew. Not finding the enemy, in any body, to oppose their progress, and unable from the season of the year, aggravated as it was by a severe famine, to procure forage and provisions, the army retreated by the way of Linlithgow and the Lothians to Berwick, where Edward remained inactive for eight months. Bruce, during this invasion, cautiously avoided an open engagement, contenting himself with sending detached parties to hang upon the rear of the English.

About this time the castle of Linlithgow—a place of great importance to the English, as being midway between Stirling and Edinburgh—was surprised by a poor peasant named William Binnock. This man, having been employed to lead hay into the fort, placed a party of armed friends in ambush as near as possible to the gate; and concealing under his seeming load of hay eight armed men, advanced to the castle, himself walking carelessly by the side of the wain, while a servant led the cattle in front. When the carriage was fairly in the gateway, so that neither the gates of the castle could be closed, nor the portcullis let down, the person in front who had charge of the oxen cut the soam or withy rope by which the animals were attached to the wain, which thus instantly became stationary. Binnock, making a concerted signal, his armed friends leaped from under the hay and mastered the sentinels; and being immediately joined by the other party in ambush, the garrison, almost without resistance, were put to the sword, and the place taken.

Robert, finding his authority well established at home, and Edward almost entirely engrossed by the dissensions of his own subjects, resolved, by an invasion of England, to retaliate the miseries with which that country had so long afflicted his kingdom. Assembling a considerable army, he advanced into the bishopric of Durham, laying waste the country with fire and sword, and giving up the whole district to the reckless license of the soldiery. "Thus," says Fordun, "by the blessing of God, and by a just retribution of providence, were the perfidious English, who had despoiled and slaughtered many, in their turn subjected to punishment." Edward II. made a heavy complaint to the pope of the "horrible ravages, depredations, burnings, and murders" com-

mitted by "Robert Bruce and his accomplices" in this inroad, in which "neither age nor sex were spared, nor even the immunities of ecclesiastical liberty respected." The papal thunder had, however, already descended harmless on the Scottish king and his party; and the time had arrived when the nation eagerly hoped, and the English might well dread, the coming of that storm which should avenge the injuries inflicted on Scotland.

Soon after his return from England, Robert laid siege to Perth, a place in those days so strongly fortified, that, with a sufficient garrison, it might bid defiance to any open force. Having lain before the town for six weeks, the king raised the siege, and retired to some distance, as if he had desisted from the enterprise. He had gained intelligence, however, that the ditch which surrounded the town was fordable in one place; and having provided scaling-ladders of a sufficient length, he, with a chosen body of infantry, returned after an absence of eight days, and approached the works. The self-security of the garrison, who thought he was at a distance, and the darkness of the night, favoured his enterprise. Himself carrying a ladder, he was the foremost to enter the ditch, the water of which reached breast-high, and the second to mount the walls when the ladders were applied. A French knight, serving under the Scottish king, having witnessed such a gallant example, is reported to have exclaimed with enthusiasm, "What shall we say of our lords of France, that with dainty living, wassail, and revelry pass their time, when so worthy a knight, through his great chivalry, puts his life into so great hazard to win a wretched hamlet." Saying this, he, with the lively valour of his nation, threw himself into the fosse, and shared in the danger and glory of the enterprise. The walls were scaled, and the town taken almost without resistance. By the king's orders quarter was given to all who laid down their arms; and in accordance with the policy he had hitherto pursued, the fortifications of the place were entirely demolished.

Edward once more made advances for a truce with the Scottish king; but Robert, who well knew the importance of following up his success, rejected the proposals, and again invaded England. In this incursion the Scottish army ravaged and plundered the county of Northumberland and bishopric of Durham. The towns of Hexham and Corbridge, and great part of the city of Durham, were burned. The army, in returning, were bold enough, by a forced march, to attempt the surprisal of Berwick, where the English king then lay; but their design being discovered, they were obliged to retire. So great was the terror of these predatory visitations in the districts exposed to them, that the inhabitants of the county of Durham, and afterwards those of Northumberland, Cumberland, and Westmoreland, contributed each a sum of £2000 to be spared in future from such spoliations. In the same year the king assaulted and took the castles of Butel, Dumfries, and Dalswinton. The strong and important fortress of Roxburgh, also, at this time fell into his hands by the stratagem and bravery of Sir James Douglas. All of these places were, by the king's orders, destroyed, that they might on no future occasion become serviceable to the enemy.

The surprisal of Edinburgh Castle by Randolph, the king's nephew, ought not, among the stirring events of this time, to be passed over. That brave knight had for some time strictly blockaded the castle; but the place being one of great natural strength, strongly fortified, and well stored with men and provisions, there seemed little hope of its capture. The garrison were also

completely upon the alert. Having had reason to suspect the fidelity of Leland, their governor, they had put him under confinement, and elected another commander. Matters stood thus when a singular disclosure, made to Randolph by a man named William Frank, suggested the possibility of taking the almost impregnable fortress by escalade. This man, in his youth, had resided in the castle as one of the garrison; and having an amorous intrigue in the city, he had been wont to descend the wall in the night by means of a rope-ladder, and through a steep and intricate path to arrive at the foot of the rock. By the same precipitous road he had always regained the castle without discovery; and so familiar had all its windings become to him, that he confidently engaged to guide a party by the same track to the bottom of the walls. Randolph resolved to undertake the enterprise. Having provided a suitable ladder, he, with thirty chosen men, put himself under the guidance of Frank, who, towards the middle of a dark night, safely conducted the party to the bottom of the precipitous ascent. After clambering with great difficulty about half-way up the rock, the adventurous party reached a broad projection or shelf, on which they rested to recover breath. While in this position, they heard above them the guard or check-watch of the garrison making their rounds, and could distinguish that they paused a little on that part of the ramparts immediately over them. One of the watch, throwing a stone from the wall, cried out, "Away, I see you well." The stone flew over the heads of the ambuscading party, who happily remained unmoved, as they really were unseen. The guard, hearing no stir to follow, passed on. Having waited till they had gone to a distance, the assailants again got up, and at the peril of their lives succeeded in clambering up the remaining part of the rock to the foot of the wall, to which they affixed their ladder. Frank, the guide, was first to mount the walls; Sir Andrew Gray was the next; Randolph himself was the third. Before the whole could reach the summit of the wall, the alarm was given, and the garrison rushed to arms. A fierce encounter took place; but the governor having been slain, the English surrendered. The fortifications of the castle were dismantled; and Leland, the former governor, having been released from his confinement, entered the Scottish service.

The Earl of Athole, who had long adhered to the English faction, and who had recently obtained as a reward for his fidelity a grant of lands in England, now joined the rising fortunes of his lawful sovereign. Through the mediation of France, conferences for a truce were renewed; but, notwithstanding of these, Robert invaded Cumberland, wasting the country to a great extent. The Cumbrians earnestly besought succour from Edward; but that prince being about to depart for France, did nothing but extol their fidelity, desiring them to defend themselves until his return. By invading Cumberland at this time, Bruce probably intended to draw the attention of the English from the more serious design which he contemplated of making a descent upon the Isle of Man. He had scarcely, therefore, returned from his predatory expedition into England, than, embarking his forces, he landed unexpectedly upon that island, overthrew the governor, took the castle of Ruffin, and possessed himself of the island. The Manx governor on this occasion is, with great probability, conjectured to have been the same Gallovidian chieftain who defeated and made prisoners at Lochryan the two brothers of the Scottish king.

On his return from France, Edward was met by commissioners sent to him by such Scots as still

remained faithful in their allegiance to England. These made bitter complaint of the miserable condition to which they had been reduced, both from the increasing power of Bruce, and from the oppression which they suffered under the government of the English ministers. Edward, deserted and despised by his nobility, who at this time not only refused to attend his army, but even to assemble in parliament upon his summons, could merely answer these complaints by promises which he was unable to perform. Meanwhile the arms of the patriots continued to prosper. Edward Bruce took and destroyed the castle of Rutherglen, and the town and castle of Dundee. He next laid siege to the castle of Stirling, then held by Philip de Mowbray, an English commander of bravery and reputation; but was here less successful. Unable, by any mode of attack known in those days, to make impression on a fortress of so great strength, Edward consented to a treaty with the governor that the place should be surrendered, if not succoured by the King of England before St. John's day in the ensuing midsummer. Bruce was much displeased with his brother for having granted such a truce, yet he consented to ratify it. The space of time agreed upon allowed ample leisure to the English king to collect his forces for the relief of the castle—the almost only remaining stronghold which he now possessed in Scotland; and Robert felt that he must either oppose him in battle with a greatly inferior army, or, by retreating in such circumstances, lessen the great fame and advantages which he had acquired.

The English king having effected a temporary reconciliation with his refractory nobility, lost no time in making preparations, not only to relieve the castle of Stirling, but to recover the revolted kingdom to his authority. He summoned the whole power of the English barons to meet him in arms at Berwick on the 11th of June; invited to his aid Eth O'Connor, chief of the native Irish of Connaught, and twenty-six other Irish chieftains; summoned his English subjects in Ireland to attend his standard, and put both them and the Irish auxiliaries under the command of the Earl of Ulster. "So vast," says Barbour, "was the army which was now collected, that nothing nearly so numerous had ever before been arrayed by England, and no force that Scotland could produce might possibly have been able to withstand it in the open field." A considerable number of ships were also ordered for the invasion of Scotland by sea, and for transporting provisions and warlike stores for the use of the army.

The Scottish king, meanwhile, used every effort to meet the approaching contest, and appointed a general rendezvous of his forces at the Torwood, between Falkirk and Stirling. His fighting men somewhat exceeded 30,000 in number, besides about 15,000 unarmed and undisciplined followers of the camp, according to the mode in those times. Two days before the battle he took up his position in a field not far from Stirling, then known by the name of New Park, which had the castle on the left, and the brook of Bannock on the right. The banks of the rivulet were steep and rugged, and the ground between it and Stirling, being part of a park or chase, was partly open, and partly broken by copse-wood and marshy ground. The place was naturally well adapted for opposing the attacks of cavalry, and to strengthen it yet more those places whereby horsemen might have access were covered with concealed pitfalls, so numerous and close together, that, according to one ancient authority, they might be likened to a honey-comb. They were a foot in width, and between two and three feet deep, many rows being

placed one behind the other, the whole being slightly covered with sods and brushwood, so as not to be obvious to an impetuous enemy. The king divided his regular forces into four divisions. Three of these occupied the intended line of battle, from the brook of Bannock, which covered his right flank, to the village of St. Ninians, where their left must have remained somewhat exposed to the garrison of Stirling in their rear; Bruce, perhaps, trusting in this disposition partly to the honour of Mowbray, who by the terms of the treaty was precluded from making any attack, but probably more to his real inability of giving any effectual annoyance. Edward Bruce commanded the right wing of these three divisions, which was strengthened by a strong body of cavalry under Keith, the mareschal of Scotland, to whom was committed the charge of attacking the English archers; Sir James Douglas and the young Stewart of Scotland led the central division, and Thomas Randolph, now Earl of Moray, the left. The king himself commanded the fourth or reserve division, composed of the men of Argyle, the islanders, and his own vassals of Carrick. The unarmed followers of the camp were placed in a valley at some distance in the rear, separated from the field by an eminence, since denominated, it is supposed, from this circumstance, the Gillies' (that is, the Servants') Hill. These dispositions were made upon the 22d of June, 1314; and next day, being Sunday, the alarm reached the Scottish camp of the approach of the enemy. Sir James Douglas and the mareschal were despatched with a body of cavalry to reconnoitre the English army, then in full march from Falkirk towards Stirling. They soon returned, and, in private, informed the king of the formidable state of the enemy, but gave out publicly that the English, though indeed a numerous host, seemed ill commanded and disorderly. The hurried march of Edward into Scotland might give some colour of truth to this information; but no sight, we are told by the ancient authors, could in reality be more glorious and animating than the advance of that great army, in which were concentrated the whole available chivalry, and all the martial pomp which the power and riches of the English monarch could command.

Robert was particularly anxious that no succours from the English army should reach the garrison in Stirling Castle, and enjoined Randolph, who commanded his left wing, to be vigilant against any such attempt. This precaution was not unsuccessful; for, as the English forces drew near, a body of 800 horsemen were detached under the command of Clifford, who, making a circuit by the low grounds to the east and north of St. Ninians, attempted to pass the front of the Scottish army and approach the castle. They were perceived by the king, who, coming hastily up to Randolph, exclaimed, "Thoughtless man! you have suffered the enemy to pass your post: a rose has fallen from your chaplet!" On receiving this sharp reproof, Randolph hurried with 500 spearmen to redeem his negligence, or perish in the attempt. The English cavalry, perceiving his advance, wheeled round to attack him. Randolph drew up his small party into a compact form, presenting a front of spears extending outwards on all sides, and awaited the charge. In this porcupine-like form were they assailed on every side by Clifford's cavalry, but without effect. At the first onset a considerable number of the English were unhorsed, and Sir William Daynecourt, an officer of rank, was slain. Environed, however, as he was, there seemed no chance for Randolph; and Douglas, who witnessed the jeopardy of his friend, requested permission of the king to go and succour him.

"You shall not move from your ground," said Robert; "let Randolph extricate himself as he best may; I will not for him break purpose." "In truth," replied Douglas, after a pause, "I cannot stand by and see Randolph perish; and, with your leave, I *must* aid him." The king unwillingly consented, and Douglas hastened to the rescue. The generous support of the good knight was not required; for he had not advanced far when he perceived the English to waver, and fall into confusion. Ordering his followers to halt, "those brave men," said he, "have repulsed the enemy; let us not diminish their glory by sharing it." The assailants had indeed begun to flag in their efforts, when Randolph, who watched well his opportunity, ordering, in his turn, a sudden and furious charge among them, put the whole body to flight, sustaining on his own side a loss so small as to seem almost incredible.

While this spirited combat was going on in one part of the field, another, of a still more extraordinary character, was destined to arrest the attention of both armies. The English, who had slowly advanced in order of battle, had at length, before evening, approached so near, that the two opposing vanguards came distinctly into view of each other. Robert was then riding leisurely along the front of the Scottish line, mealy mounted on a small palfrey, having a battle-axe in his hand, and distinguished from his knights by a circlet of gold over his helmet. Henry de Bohun, an English knight, completely armed, chanced to ride somewhat in advance of his companions, when, recognizing the Scottish king alone, and at such disadvantage, he rode furiously towards him with his spear couched, trusting to have unhorsed or slain him on the spot. Robert awaited the encounter, avoided the spear of his adversary, and rising in the stirrups, struck Bohun, as he passed, with such a blow of his battle-axe as to cleave the steel helmet of the knight, and break the handle of the axe into two. The Scots, animated by this exploit of their leader, advanced upon the English vanguard, who immediately fell back in some confusion upon their main body. When the Scottish army had again recovered order, some of its leaders kindly rebuked Robert for his imprudence. The king, conscious of the justice of their remarks, said that he was sorry for the loss of his good battle-axe. These two incidents falling out so opportunely upon the eve of battle greatly animated the courage of the patriot army, while, in a like degree, they abashed and dispirited the enemy.

On Monday the 24th of June, at break of day, the two armies mustered in order of battle. The van of the English, consisting of archers and lancemen, was commanded by the Earl of Gloucester, nephew of King Edward, and the Earl of Hereford, constable of England. The main body, comprising nine great divisions, was led by the king in person, attended by the Earl of Pembroke and Sir Giles d'Argentine, a knight of Rhodes, and a chosen body of 500 well-armed horse as his body-guards. The nature of the ground did not permit the extension of this vast force, the van division alone occupying the whole front of battle, so that to the Scots they appeared as composing one great compact column. The Scots drew up in the order which we have already described. Maurice, abbot of Inchaffrey, placing himself on an eminence in view of the whole Scottish army, celebrated high mass; then passing along the line bare-footed, and bearing a crucifix in his hand, he exhorted the Scots in few and forcible words to combat for their rights and their liberty, upon which the whole army knelt down and received his benediction. When King Edward observed the small and unpre-

tending army of his enemies, he seemed surprised, and turning himself to Sir Ingram Umphraville, exclaimed, "What! will yon Scotsmen fight?" "Yea, sickly," replied the knight, who even went the length of advising the king that, instead of making an open attack under so great disadvantages of position, he should feign a retreat, pledging himself, from his own experience, that by such means only could he break the firm array of the Scots and overwhelm them. The king disdained this counsel; and chancing then to observe the whole body of the Scots kneel themselves to the ground—"See," said he, "yon folk kneel to ask mercy." "You say truly," Sir Ingram replied; "they ask mercy, but it is not of you, but of God. Yon men will win the field or die." "Be it so then," said the king, and immediately gave order to sound the charge.

At the signal of attack, the van of the English galloped on to charge the right wing of the Scots, commanded by Edward, the king's brother, and were received with unshaken firmness. This advance allowed part of the main body of the English to come up, who, moving obliquely to the right of their own van, were soon engaged with the centre and left flank of the Scottish army. The conflict thus soon became general along the whole Scottish line. Repeated and desperate attempts were made by the English cavalry to break the firm, or as they seemed immovable, phalanxes of the enemy, but with no effect. Straitened and harassed by the nature of the ground, they with difficulty maintained order; and but that they were pressed on by the mass in their rear, the front lines of the English would have been repulsed. Bruce perceiving that his troops were grievously annoyed by the English archers, detached a small but chosen band of cavalry under Sir Robert Keith, who, making a circuit by the right extremity of the Scottish line, fell furiously upon the unprotected archers in flank, and put them to flight. This body of men, whose importance in an English army was so often exemplified, were so effectually scattered, as to be of no after use in the battle. Robert with his body of reserve now joined battle; and though the fury on both sides was not relaxed, the English forces were every moment falling more and more into disorder. Matters were in this critical state, when a singular accident or device, for which never has been ascertained which, decided the fortune of the day. As before stated, the Scottish camp was attended by about fifteen thousand followers; and these, along with the camp baggage, were stationed by Bruce to the rear of a little eminence called Gillies' Hill. These men, either instructed for the purpose, or, what seems more likely, perceiving that the English army began to give way, resolved with what weapons chance afforded, to fall down into the rear of their countrymen, so that they might share in the honour and plunder of the victory. They drew up into a sort of martial order, some mounted on the baggage horses and others on foot, having sheets fastened upon tent-poles and spears, instead of banners. The sudden spectacle of what seemed to the English a new army, completed their confusion; the Scots felt their advantage, and raising a shout, pressed forward on their enemies with a fury which became irresistible. Discipline and union were lost, and the rout of the English was complete.

Pembroke, when he saw that the day was lost, seized Edward's horse by the bridle, and constrained him to leave the field. When Sir Giles d'Argentine, the brave knight of Rhodes, was informed of the king's flight, and pressed to accompany him, "It never was my wont to fly," said he, and putting spurs to his horse, he rushed into the battle and met

his death. It was a vulgar opinion, that the three greatest warriors of that age were Henry of Luxemburg emperor of Germany, Robert king of Scotland and Sir Giles d'Argentine. Sir James Douglas, with sixty horsemen, followed hard in pursuit of the English king. At the Torwood he was met by Sir Lawrence Abernethy with twenty horse hastening to the English rendezvous, but who, as soon as he understood that the Scots were victorious, joined the party of Douglas in the pursuit. Edward rode on without halting to Linlithgow; and had scarcely refreshed himself there, when the alarm that the Scots were approaching, forced him to resume his flight. Douglas and Abernethy followed so close upon his route, that many of the king's guards, who chanced to fall behind their companions, were slain. This pertinacious chase continued as far as Tranent, a distance of about forty miles from the field of battle, and was only given up when the horses could proceed no further. Edward at length reached the castle of Dunbar, where he was received by the Earl of March, and shortly afterwards conveyed by a little fishing skiff to Bamborough, in England.

Thirty thousand of the English are estimated to have fallen upon the field of Bannockburn. Of barons and bannerets there were slain twenty-seven, and twenty-two were taken prisoners; of knights the number killed was forty-two, while sixty were made prisoners. Barbour affirms that 200 pairs of gilt spurs were taken from the heels of slain knights. According to English historians the most distinguished among those who fell were the Earl of Gloucester, Sir Giles d'Argentine, Robert Clifford, Payen Tybelot, William le Mareschal, and Edmund de Mauley, seneschal of England. Seven hundred esquires are also reckoned among the slain. The spoil of the English camp was great, and large sums must have accrued from the ransom of so many noble prisoners. If we may believe the statement of the Monk of Malmesbury, a contemporary English writer, the cost sustained by his countrymen on this occasion did not amount to less than £200,000; a sum equal in value to upwards of £3,000,000 of our present currency. The loss of the Scots is allowed on all hands to have been very inconsiderable; and the only persons of note slain were Sir William Vipont and Sir Walter Ross. The last-named was the particular friend of Edward Bruce, who, when informed of his death, passionately exclaimed, "Oh that this day's work was undone, so Ross had not died." On the day after the battle, Mowbray surrendered the castle of Stirling, according to the terms of the truce, and thenceforward entered into the service of the King of Scotland.

Such was the victory obtained by Robert at Bannockburn, than which none more important was ever fought, before or since, between the so long hostile nations of England and Scotland. It broke effectually and for ever the mastery, moral and physical, which the one had so nearly established over the other; and, while it once more confirmed the liberties of Scotland, restored that passion for independence among her people which no after reverses could subdue. "We have only," as a late historian¹ has well observed, "to fix our eyes on the present condition of Ireland in order to feel the present reality of all that we owe to the victory at Bannockburn, and to the memory of such men as Bruce, Randolph, and Douglas."

We have hitherto thought it proper to enter with considerable, and even historical, minuteness into

the details of this life; both as comprising events of much interest to the general reader, and as introducing what may be justly called the first great epoch in the modern history of Scotland. The rise, progress, and establishment of Bruce, were intimately connected with the elevation, progression, and settled estate of his people, who as they never before had attained to a national importance so decided and unquestionable, so they never afterwards fell much short in the maintaining of it. It is not our intention, however, to record with equal minuteness the remaining events of King Robert's reign; which, as they, in a great measure, refer to the ordering and consolidating of the power which he had acquired, the framing of laws, and negotiating of treaties, fall much more properly within the province of the historian to discuss, than that of the biographer.

The Earl of Hereford, who had retreated after the battle to the castle of Bothwell, was there besieged and soon brought to surrender. For this prisoner alone, the wife, sister, and daughter of Bruce were exchanged by the English, along with Wisheart Bishop of Glasgow, and the young Earl of Mar. Edward Bruce and Douglas, leaving the English no time to recover from their disastrous defeat, almost immediately invaded the eastern marches, wasted Northumberland, and laid the bishopric of Durham under contribution. Proceeding westward, they burned Appleby and other towns, and returned home loaded with spoil. "So bereaved," says an English historian, "were the English, at this time, of their wonted intrepidity, that a hundred of that nation would have fled from two or three Scotsmen." While the fortunes of Edward were in this state of depression, Bruce made advances towards the negotiating of a peace, but this war, now so ruinous on the part of the English, was yet far from a termination. Robert, however desirous he might be to attain such an object, was incapable of granting unworthy concessions; and Edward was not yet sufficiently abased by his ill-fortune in war, or borne down by factions at home, to yield that which, in his hands, had become but a nominal possession. England was again invaded within the year; and, during the winter, the Scots continued to infest and threaten the borders with predatory incursions.

In the spring of the ensuing year, 1315, while the English king vainly endeavoured to assemble an army, the Scots again broke into England, penetrated to the bishopric of Durham, and plundered the seaport town of Hartlepool. An attempt was shortly afterwards made to gain possession of Carlisle, but it was defeated by the vigorous efforts of the inhabitants. A scheme to carry Berwick by surprise also failed. This year was remarkable for an act of the estates settling the succession to the crown; and the marriage of the king's daughter, Marjory, to Walter the Stewart of Scotland, from whom afterwards descended the royal family of the Stuarts.

The Irish of Ulster, who had long been discontented with the rule of England, now implored the assistance of the Scottish king, offering, should they be relieved, to elect Edward Bruce as their sovereign. The king closed with their proposals; and his brother, on the 25th May, 1315, landed at Carrickfergus in the north of Ireland with an army of 6000 men. He was accompanied in the expedition by the Earl of Moray, Sir Philip Mowbray, Sir John Soules, Fergus of Ardrossan, and Ramsay of Ochterhouse. With the aid of the Irish chieftains who flocked to his standard, he committed great ravages on the possessions of the English settlers in the north, and overran great part of the country. Edward Bruce met, however, with considerable difficulties in the prosecution

¹ Tytler, i. p. 320.

of his enterprise, and had several times to send for reinforcements from Scotland, notwithstanding which he was solemnly crowned King of Ireland on the 2d May, 1316. King Robert, hearing of his difficulties, magnanimously resolved, with what succours he could afford, to go to the relief of his brother in person. Intrusting, therefore, the government of the kingdom, in his absence, to the Stewart and Douglas, he embarked at Lochryan, in Galloway, and landed at Carrickfergus. The castle of that place was at the time besieged by the forces of Edward Bruce, and was soon brought to surrender after his junction with his brother. The united armies then entered, by forced marches, the province of Leinster, with intent to seize upon Dublin, on the fate of which the existence of the English government in Ireland depended; but the hostile spirit and intrepidity of the inhabitants of that city rendered this effort abortive. Thence they marched to Cullen, in Kilkenny, and continued their devastating progress as far as Limerick; but being there threatened with the greatly superior forces collected by the English under Roger, Lord Mortimer, and experiencing great extremities from want, they were forced to terminate the expedition by a retreat into the province of Ulster, in the spring of 1317.

The particular history of the two Bruce's campaigns in Ireland seems to have been imperfectly known, and is very obscurely treated of by most contemporary writers. Barbour, however, to whom the historians who treat of this period are so much indebted, has given the relation with much circumstantiality and apparent correctness. We cannot omit quoting one exploit, which this author has recorded in a manner at once lively and characteristic. The Scottish army, in its march into the province of Leinster, was marshalled into two divisions, one of which, the van, was commanded by Edward Bruce; while the rear was led by Robert in person, assisted by the Earl of Moray. The Earl of Ulster, on the alert to oppose their progress, had collected an army of 40,000 men, which he posted in an extensive forest through which the Scottish line of march led, proposing from this concealment, to attack the rear division of the enemy, after the van should have passed the defile. Edward, naturally impetuous and unguarded, hurried onward in his march, neglecting even the ordinary precautions of keeping up a communication with the rear body, or of reconnoitring the ground through which he passed. Robert advanced more slowly and with circumspection, at some distance in the rear, with his division, which amounted in all to no more than 5000 men. As he approached the ambushment of the enemy, small parties of archers appeared from among the thickets, who began to molest his soldiers in their march. Seeing their boldness, the king judged rightly that they must have support at no great distance, and immediately he issued strict commands to his men to march in exact order of battle, and on no pretence to quit their ranks. It happened that two of these archers discharged their arrows near to the person of Sir Colin Campbell, the king's nephew, who, neglecting the king's injunctions, rode off at full speed to avenge the insult. Robert, highly incensed, followed after him, and struck his nephew so violent a blow with his truncheon that he was nearly beaten from his horse. "Such breach of orders," said he, "might have brought us all into jeopardy. I wot well, we shall have work to do ere long." The numbers of the hostile archers increased as the Scots advanced; till, arriving at a large opening or glade of the forest, they descried the forces of the Earl of Ulster drawn up in four divisions ready to dispute

their passage. The king's prudent foresight was justified; and, so much confidence had the soldiers in his sagacity, that, undaunted either by the sudden appearance or overwhelming numbers of the enemy, they were the first to commence the attack. After an obstinate resistance the Scots prevailed, and the ill-assorted Anglo-Irish army was, with much slaughter, driven from the field. Edward Bruce, soon after the defeat, rejoined his brother, regretting bitterly that he should have been absent on such an emergency. "It was owing to your own folly," said the king, "for you ought to have remembered that the van always should protect the rear."

King Robert, after the retreat of his brother's force upon Carrickfergus, was necessitated by his own affairs to return to Scotland. That we may have no occasion to revert to the subject afterwards, we shall state briefly in this place the catastrophe which, in the following year, closed the career of Scottish sovereignty in Ireland. For some time the gallant but rash Edward maintained a precarious authority in Ulster. In the month of October, 1318, he lay encamped at Fagher, near Dundalk, with an army amounting to about 2000 men, exclusive of the native Irish, who, though numerous, were not much to be depended on. The Anglo-Irish approached his position under the command of Lord John Bermingham. Their force was strong in cavalry, and outnumbered the Scots by nearly ten to one. Contrary to the counsel of his officers, Edward engaged with the enemy and was slain almost at the first onset; an event which was speedily followed by the total discomfiture of his army. John Maupas, by whose hand Edward fell, was found, after the battle, stretched dead over the body of the prince. Edward of England, like all kings who are weak and obstinate, could also, when he dared, be wicked. Affecting to consider the gallant enemy who now had fallen in the light of a traitor or rebellious subject, the corpse was subjected to the ignominies consequent upon the punishment of such, being quartered and exposed to view in four different quarters of the island. The head was carried over to England, and presented to Edward by Bermingham himself, who obtained the dignity of Earl of Lowth for his services.

During the absence of King Robert in Ireland, the English made various attempts to disturb the tranquillity of Scotland, which all happily proved abortive. The Earl of Arundel, with a numerous force, invaded the forest of Jedburgh; but falling into an ambush prepared for him by Douglas, he was defeated. Edmund de Cailand, the governor of Berwick, having made an inroad into Teviotdale, was attacked by the same victorious commander, and himself and many of his followers slain. The same fate befell Robert Neville, a knight, then resident at Berwick, who had boastingly declared that he would encounter Douglas so soon as he dared to display his banner in that neighbourhood. The English also invaded Scotland with a considerable force by sea, coming to anchor off the town of Inverkeithing in the Firth of Forth. The panic caused by the unexpected appearance of this armament was great; and only 500 men under the command of the Earl of Fife, and sheriff of the county, were mustered to oppose their landing. When the English cast anchor, so much terror did they inspire, that the force drawn up against them hastily retreated. They had scarcely, however, thus committed themselves, when they were met by William Sinclair, Bishop of Dunkeld, at the head of a body of sixty horse, advancing in all haste to assist in repelling the invaders. "Whither in such haste?" said he to the disordered rout; "you deserve to have your

gilt spurs hacked off." Putting himself then at the head of the little troop, and seizing a spear, the bold ecclesiastic continued—"Who loves his king, or his country, turn with me!" The spirit of this challenge rallied the fugitives; the English, who had not yet completed their landing, were panic-struck in turn, and driven back to their ships with great loss. Five hundred, it is asserted, were killed upon the strand, and many drowned by the swamping of an overloaded boat. When King Robert was informed of this gallant exploit, he said, "Sinclair shall always after be my own bishop;" and long after was the prelate honourably remembered by the title of *the king's bishop*.

Baffled in these attempts, and under serious apprehensions for the safety of his own borders, the English king contrived, about this time, to employ in his favour the spiritual weapons of Rome; and John XXII., the then pope, issued a bull commanding a truce for two years between the two hostile kingdoms, under pain of excommunication. Two cardinals, privately instructed to denounce the pontifical censures, should they see fit, upon Bruce and "whomsoever else," were despatched to make known these commands to the two kings. The cardinals arrived in England, and in prosecution of their errand sent two messengers, the Bishop of Corbeil and Master Aumery, into Scotland with the letters and instructions intended for the Scottish king. Robert listened to the message delivered by these nuncios with attention, and heard read the open letters from the pope; but when those sealed and addressed "Robert Bruce, governor of Scotland," were produced, he firmly declined receiving them. "Among my barons," said he, "there are many of the name of Robert Bruce, who share in the government of Scotland. These letters may possibly be addressed to one of them; but they are not addressed to me, who am king of Scotland." The messengers attempted to apologize for this omission, by saying that "the holy church was not wont, during the dependence of a controversy, to say or do aught which might prejudice the claims of either contending party." "Since then," replied the king, "my spiritual father and my holy mother would not prejudice the cause of my adversary by bestowing on me the title of king during the dependence of the controversy, they ought not to have prejudiced my cause by withdrawing that title from me. It seems that my parents are partial to their English son. Had you," added he, with resolute but calm dignity, "presumed to present letters with such an address to any other sovereign prince, you might perhaps have been answered more harshly; but I reverence you as the messengers of the holy see." In consequence of the failure of this negotiation, the cardinals resolved to proceed with their further instructions, and proclaim the papal truce in Scotland. In an enterprise so hazardous, the Roman legates were at some loss how to proceed; but at length they fell upon a devoted monk of the name of Adam Newton, who was willing to risk himself in the service. Newton being fully charged with his commission, and intrusted with letters to some of the Scottish clergy, proceeded forthwith upon his journey. He found the Scottish king encamped with his army in a wood near Old Cambus, busily engaged in making preparations for the assault of Berwick. He was denied admission to the royal presence, but ordered, at the same time, to deliver what letters or messages he might have to the king's seneschal or clerk. These were quickly returned to him, unopened, with the brief verbal answer, "I will listen to no bulls until I am treated as King of Scotland, and have made

myself master of Berwick." The poor monk, envied, as he himself expresses it, with danger, and troubled how to preserve his papers and his own mortal life, entreated that he might have a safe-conduct to pass further into Scotland, or at least that he might return without peril to Berwick; but both requests were denied him, and he was ordered to leave the country without delay. On his road to Berwick he was encountered by four armed ruffians, who stripped him of all his papers and effects, and even of the greater part of his clothes. Thus ended this memorable transaction with the papal court, in a manner very unusual for that age; but the weakness and injustice of Edward, and the injustice and servility of Rome, were so obvious in it, that Robert, secure otherwise in the affections of his subjects, both clerical and laical, could safely deride and defy the effects of both.

While Robert, for some reason or other which has not been explained, had given over his preparations for the siege of Berwick, the treachery of one of the inhabitants, of the name of Spalding, who had been harshly treated by the governor, occurred to render the attainment of his object both easy and sure. This person wrote a letter to the Earl of March, to whom he was distantly connected by marriage, offering to betray, on a certain night, that post on the wall where he kept guard. The nobleman, not daring of himself to engage in such an enterprise, communicated the intelligence to the king. "You have done well," said Robert, "in making me your confidant; for, if you had told this to either Randolph or Douglas, you would have offended the one whom you did not trust. You shall now, however, have the aid of both." By the king's directions, the Earl of March assembled his troops at a certain place, where, on an appointed day and hour, he was joined by the forces of Randolph and Douglas. Thus cautiously assembled, the army by a night march approached the town. Having reached the appointed part of the walls, near to that place still known by the name of the Cowport, they, with the assistance of Spalding, scaled the walls, and were, in a few hours, masters of the town. The castle, after a brief siege, in which the king assisted in person, was forced to surrender. Scotland, by this event, was at length wholly regained to its ancient sovereignty; and, though the town was in an after reign retaken by the English, so pertinaciously was the old right to it maintained at the union of the two kingdoms, that, as a compromise, it was legislatively allowed to belong to neither kingdom, and it still forms a distinct and independent portion of the British dominions.

The Scottish army, after the reduction of Berwick, invaded England by Northumberland; took by siege the castles of Werk and Harbottle, and that of Mitford by surprise. These events occurred in the spring of 1318. In May of the same year, the Scots penetrated into Yorkshire, burned the towns of Northallerton, Boroughbridge, Scarborough, and Skipton, and returned home loaded with spoil, and, says an English author, "driving their prisoners before them like flocks of sheep." Bruce was at this time solemnly excommunicated by the pope's legate in England; but so little was this sentence regarded, that, in a parliament which was assembled at Scone, the whole clergy and laity of the kingdom renewed their allegiance to the king; and by a memorable mode of expression, by which, doubtless, they meant to include the pope as well as the King of England, solemnly engaged to protect the rights and liberties of Scotland against all mortals, *however eminent they may be in power, authority, and dignity.*

By a temporary reconciliation of the factions of his kingdom, Edward was enabled, in the succeeding year, to attempt the recapture of Berwick. The place had been left by Robert under the command of the Stewart, with a strong garrison, and was plentifully stored with provisions. To prevent the approach of succours, the English drew lines of countervallation round it; and confident in their numbers, commenced a general and vigorous assault. After a long and desperate contest they were repulsed. They next made their attacks more systematically on various places, and often simultaneously, aided by engines and contrivances which are curiously and minutely described by ancient historians; but these attempts, admirably conducted as they were, according to the engineering science of that day, proved abortive. One of those engines used by the English was called a *sow*. As nearly as can be ascertained, it was a huge fabric, reaching in height above the top of the wall, and composed of beams of timber, well roofed, having stages within it. It moved upon wheels, and was calculated for the double purpose of conducting miners to the foot of the wall, and armed men for scaling it. To oppose this and other such machines, the Scots, under the direction of one John Crab, a Fleming, had provided themselves with movable engines called cranes, similar to the catapultæ of the ancients, capable of throwing large stones with great projectile force. As the sow advanced, however, the besieged were dismayed. The engineer by whom the monstrous edifice had been constructed had, meantime, become a prisoner to the Scots, who, actuated by a very unjust revenge upon the man's ingenuity and their own fears, brought him to that part of the wall against which the engine was directed, threatening him with instant death should he be slack in its destruction. Thus prompted, he caused one of the cranes formerly mentioned to be placed directly opposite the approaching machine, and prepared to work it with all his art. The first stone, launched with prodigious force, flew beyond the object aimed at; the second, discharged with diminished power, fell within the mark. There was time only for a third trial, upon the success of which all seemed to depend, as the engine was coming close to the walls. The third great stone passed in an oblique and nearly perpendicular line, high into the air, making a loud whizzing noise as it rose, and whether owing to chance or art, it fell with a dreadful crash upon the devoted machine now so nearly within reach of its destination. The terrified men within instantly rushed from beneath their cover; and the besieged upon the walls, raising a loud shout, called out to them, "that their great sow had farrowed." Grappling irons were quickly fastened upon the shattered apparatus, and it was set on fire. While all this was transacting upon the land side of Berwick, its worn-out garrison had to sustain an assault no less desperate from the estuary, where, by means of vessels having falling-bridges mid-mast high, by which to reach the top of the walls, the city was vigorously and almost successfully stormed. These and various other desperate attempts seemed in no way to exhaust the ardour of the besiegers; and they did not lessen, though they tempered, the confidence of the besieged.

King Robert, unable from the strength and fortified position of the English army, to break up the siege, at the same time saw that if the Stewart were not relieved he must soon surrender. In this emergency he resolved, by a destructive invasion of England, to make a diversion in his favour, and if possible draw off the forces of Edward. This expedi-

tion was committed to the charge of Randolph and Douglas, who, entering England by the western marches, penetrated into Yorkshire. It is asserted that they entertained some scheme of carrying off the wife of Edward from her residence near York. Disappointed in this, they wasted that rich province with fire and sword. The archbishop hastily collected a numerous but ill-assorted army, great part of which is said to have been composed of ecclesiastics, and placing himself at their head, determined to check the invaders. The Scots then lay encamped at Mitton near Boroughbridge, in the north riding of Yorkshire. The English, on coming up with that hardy, disciplined, and successful army, were charged with such fury, that, scarcely waiting to strike a blow, they gave way, and three thousand are reported to have been slain in the rout. From the number of churchmen who fell in this battle, it was afterwards popularly named *the Chapter of Mitton*. The effects which Bruce expected from this invasion of England were not miscalculated. The news of the devastations and successes of the Scots no sooner reached Berwick, than a retreat was resolved upon, and it would seem judiciously, as, had the now unopposed career of the Scots continued many days longer, the damage to England must have been immeasurably great. On retiring from before Berwick, Edward attempted, unsuccessfully, to intercept Douglas and Randolph on their return. After some brief negotiations, a truce of two years was concluded between the two nations.

The following year (1320) was remarkable for a bold and spirited manifesto from the estates of Scotland to the pope. His holiness is told, in one part of this singular document, that Robert, "like another Joshua, or a Judas Maccabeus, gladly endured toils, distresses, the extremities of want, and every peril, to rescue his people and inheritance out of the hands of the enemy. Our due and unanimous consent," say they, "has made him our chief and king. To him in defence of our liberty we are bound to adhere, as well of right as by reason of his deserts, and to him we will in all things adhere; for through him salvation has been wrought unto our people. Should he abandon our cause, or aim at reducing us and our kingdom under the dominion of the English, we will instantly strive to expel him as a public enemy, and the subverter of our rights and his own, and we will choose another king to rule and protect us; for, while there exist an hundred of us, we will never submit to England. We fight not for glory, wealth, or honour, but for that liberty which no virtuous man will survive." After describing with much animation the English king's ambition and injustice, and praying the interposition of his holiness, the manifesto proceeds:—"Should you, however, give a too credulous ear to the reports of our enemies, distrust the sincerity of our professions, and persist in favouring the English, to our destruction, we hold you guilty in the sight of the most high God, of the loss of lives, the perdition of souls, and all the other miserable consequences which may ensue from war between the two contending nations." The pope, however much he may have been incensed at this boldness, appears also to have been alarmed. In a bull which he shortly afterwards sent to Edward, he strongly recommends pacific measures, and bestows upon Bruce the ambiguous title of "Regent of the kingdom of Scotland."

The parliament which distinguished itself by this spirited and honourable measure was, in the course of its sitting, engaged in one of a more displeasing character. This was the investigation of a conspiracy in which some of the highest men in the kingdom

were implicated. The affair is now, from the loss of records, but indistinctly understood. After a trial of the conspirators, Soulis and the Countess of Strathern were condemned to perpetual imprisonment. Gilbert de Malerb and John de Logie, both knights, and Richard Brown, an esquire, were found guilty of treason, and suffered accordingly. Roger de Mowbray died before sentence; yet, according to a practice long retained in Scottish law in cases of treason, judgment was pronounced upon the dead body. The king, however, was pleased to mitigate this rigour, and the corpse was allowed the honours of sepulture. The fate of David de Brechin, the king's nephew, who suffered on this occasion, excited universal and deep compassion. His crime alone lay in the concealing of the treason, which was communicated to him under an oath of secrecy. He had neither approved of nor participated in it; yet notwithstanding these alleviations, and his near relationship to the king, he was made an example of rigorous though impartial justice. This parliament was, in reference to this transaction, long remembered popularly under the appellation of the *black parliament*.

During the inactive period of the truce, various methods were used towards effecting a peace between England and Scotland, but without effect. The pope as well as the French king offered their services for this purpose; but the exultation of Edward, from having successfully crushed the Lancastrian faction which had so long disturbed his rule, made him deaf to moderate counsels. "Give yourself," says he to the pope, "no further solicitude about a truce with the Scots. The exigencies of my affairs inclined me formerly to listen to such proposals; but now I am resolved to establish peace by force of arms." While he was engaged in these preparations, the Scots penetrated by the western marches into Lancashire, committing their wonted devastations, and returned home loaded with spoil. The King of Scots, who at this time found no occasion for a general engagement with his greatly superior enemy, fell upon a simple and effectual expedient to render such an event unlikely, if not impossible. All the cattle and provisions of the Merse, Teviotdale, and the Lothians, he ordered to be removed into inaccessible or secure places; an order which was so exactly executed, that, according to tradition, the only prey which fell into the hands of the English was one solitary bull at Tranent, which, from lameness, had been unable to travel along with the other cattle. "Is that all ye have got?" said the Earl Warenne to the spoilers as they returned to the camp; "I never saw so dear a beast." Edward advanced without opposition to the neighbourhood of Edinburgh, where, having in vain waited for some time for supplies from his fleet, he was necessitated, from absolute famine, to retire. In their countermarch into England, the soldiers committed whatever outrages were possible in so desolate a route. Their license even got the better of their superstition. Monks, who believed that the sanctity of their character would have protected them, were wantonly murdered, and their monasteries and abbeys plundered and burned. When this unfortunate army got once more into the plenty of their own country, it was little better with them; for, in proportion as their privations had been extreme, their indulgences were excessive; and an English historian has left it on record, that almost one-half of the great army which Edward had led into Scotland was destroyed either by hunger or intemperance.

The remains of the English army had scarcely once more been restored to order, when the Scots, who had followed closely upon their rear, entered England,

and laid siege to the castle of Norham. Edward himself then lay at the abbey of Biland in Yorkshire, the main body of his troops being encamped in a strong position in the neighbourhood, supposed to be accessible only by one narrow pass. The Scots, commanded by Robert in person, suddenly raising the siege, marched onward in the hope of finding the English unprepared, or, as some say, of seizing the person of Edward, by the aid of some of that monarch's treacherous attendants. This latter design, if at all entertained, which is not improbable, must have been found too difficult to execute. Douglas resolved to force the defile within which the English had entrenched themselves; and Randolph, leaving his own peculiar command in the army, determined to join his friend in the enterprise. The defence was obstinate; and the men of Douglas must have been obliged to retire, had not an unexpected aid come to their relief. The King of Scots, who commanded the main body of his army on the plain, perceiving the difficulty, if not impracticability, of the adventure of his two brave generals, fell upon the only means of extrication and success. Between the two armies lay a long craggy hill of very difficult access, except through the narrow pass of which we have made mention, and which the body of men under Douglas were vainly endeavouring to force. A party of Highlanders from Argyle and the Isles, admirably suited for the service, were ordered, at some little distance, to scale the eminences, and so gain command of the pass from the ground above, where they might, with signal effect, annoy the English underneath and in flank. The manœuvre was successfully executed, the pass carried, and the whole English army shortly after put to complete rout. They were pursued by the Stewart to the gates of York, and Edward himself escaped to the same place with the greatest difficulty, abandoning all his baggage and treasure, and leaving behind him even the privy seal of his kingdom. This was the last battle in which this undeserving and equally unfortunate prince engaged the Scots; and it may be curious to remark how, in its result, it bore some resemblance to the disaster and shame of the first. The Scots, after committing extensive devastations on the unprotected and dispirited country, returned home, carrying along with them many prisoners and an immense booty.

From this period to the accession of Edward III. to the throne of England in 1327, there occurred little which can properly come within our province to relate. A truce for fifteen years was with much willingness acceded to by the English king, who could never, however, be induced to relinquish his claim of sovereignty over Scotland. The pope was much pressed, particularly in an embassy conducted by Randolph, to permit the reconciliation of Robert with the church; but the King of Scots, as yet, possessed too little interest in that venal court to obtain such a concession. The pontiff, however, showed all the favour he could, consistent with such a denial; and though pressed by Edward, under various pretences, to renew the publication of his former censures, would by no means comply. The King of France was more honourable and just, though probably, at the same time, politic, and concluded, in 1326, a treaty of alliance, offensive and defensive, with Scotland.

On the accession of Edward III. hostilities almost immediately re-commenced between the two kingdoms. That these originated on the side of the Scots seems generally allowed; but the motives which led to them are now only matter of conjecture. One historian assigns as the cause, that the Scots

had detected the general bad faith of the English. According to Barbour, the ships of that nation had seized upon several Scottish ships bound for the Low Countries, slain the mariners, and refused to give satisfaction. That the King of Scotland during the then weak state of the counsels of England, had determined to insist upon the full recognition of his title, seems to have been, from the decisiveness of his preparations, the true, or more important, motive of the war. The campaign which followed, though, perhaps, as curious and interesting as any which occurred during these long wars, cannot be entered upon in this place, at length sufficient to render it instructive; and it much more properly falls to be described in the lives of those two great generals, Randolph and Douglas, by whom it was conducted. The enterprise, on the part of England, was productive of enormous expense to that kingdom; and it terminated not only without advantage, but without honour. The so long desired peace between the two kingdoms was now near at hand. To attain this had been the grand and constant aim of all King Robert's policy; and the court of England seemed at length persuaded of the immediate necessity of the measure. A negotiation was therefore entered into, and brought to a happy issue in a parliament held at Northampton in April, 1328. The principal articles were the recognition of King Robert's titles; the independent sovereignty of the kingdom; and the marriage of Johanna, King Edward's sister, to David, the son and heir of the King of Scots.

Robert survived not long this consummation of his political life. He had for some time laboured under an inveterate distemper, in those days called a leprosy; a consequence of the fatigues, hardships, and sufferings which, to such an unparalleled degree, he had endured in the early part of his career. It was probably the same disease as that with which he was afflicted prior to the battle of Inverury; but though, at that time, the ardour of youth and enterprise, and a naturally powerful constitution, had triumphed over its malignity, Robert seemed now fully aware that it must prove mortal. The two last years of his life were spent in comparative seclusion, in a castle at Cardross, situated on the northern shore of the Firth of Clyde; where, from documents still extant, Robert passed these few peaceful, though embittered days of his life, in a style of munificence every way becoming his high station. Much of his time was devoted to the construction of ships; and whether he himself joined personally in such amusements or not, the expense of aquatic and fishing excursions, hawking, and other sports, appears to have formed a considerable item of his domestic disbursements. From the same authentic source it is pleasing to observe that his charities to the poor were regular and befitting.

Robert the First of Scotland died in this retirement, on the 7th day of June, 1329, in the fifty-fifth year of his age and twenty-third year of his reign. Prior to this event a remarkable and affecting scene is recorded to have taken place between the dying monarch and several of his esteemed counsellors and companions in arms. Having spoke to these, generally, upon matters connected with the ordering and well-being of his kingdom, Robert called Sir James Douglas to his couch, and addressed him in somewhat the following manner:—"Sir James, my dear and gallant friend, you know well the many troubles and severe hardships I have undergone in recovering and defending the rights of my crown and people, for you have shared in them all. When I was hardest beset of all, I made a vow, that if I ever overcame my difficulties, I would assume the

cross, and devote the remainder of my days to warring against the enemies of our Lord and Saviour. But it has pleased Providence, by this heavy malady, to take from me all hope of accomplishing what, in my heart and soul, I have earnestly desired. Therefore, my dear and faithful companion, knowing no knight more valiant, or better fitted than yourself for such a service, my earnest desire is, that when I am dead, you take my heart with you to Jerusalem, and deposit it in the holy sepulchre, that my soul may be so acquitted from the vow which my body is unable to fulfil." All present shed tears at this discourse. "My gallant and noble king," said Douglas, "I have greatly to thank you for the many and large bounties which you have bestowed upon me; but chiefly, and above all, I am thankful, that you consider me worthy to be intrusted with this precious charge of your heart, which has ever been full of prowess and goodness; and I shall most loyally perform this last service, if God grant me life and power." The king tenderly thanked him for his love and fidelity, saying, "I shall now die in peace." Immediately after Robert's decease, his heart was taken out, as he had enjoined, and the body deposited under a rich marble monument, in the choir of the Abbey church of Dunfermline.

So died that heroic, and no less patriotic monarch, to whom the people of Scotland, in succeeding ages, have looked back with a degree of national pride and affection, which it has been the lot of few men in any age or country to inspire. From a state of profligate degeneracy and lawless barbarity, originating in, and aggravated by, a foreign dominion and oppression, he raised the poor kingdom of Scotland to a greater degree of power and security than it had ever before attained; and by a wise system of laws and regulations, forming, in fact, the constitution of the popular rights and liberties, secured to posterity the benefit of all the great blessings which his arms and policy had achieved.

BRUCE, ROBERT, an eminent divine of the sixteenth century, a collateral relation of the sovereign who bore the same name, and ancestor, at the sixth remove, of the illustrious Abyssinian traveller, was born about the year 1554, being the second son of Sir Alexander Bruce of Airth in Stirlingshire, by Janet, daughter of Alexander, fifth Lord Livingston, and Agnes, daughter of the second Earl of Morton. We learn from Birrel's diary, a curious chronicle of the sixteenth century, that Sir Alexander, the father of this pious divine, was one of those powerful Scottish barons who used to be always attended by a retinue of armed servants, and did not scruple, even in the streets of the capital, to attack any equally powerful baron with whom they were at feud, and whom they might chance to meet. Birrel tells us, for instance, that on "the 24th of November, 1567, at two in the afternoon, the laird of Airth and the laird of Weemins [ancestor of the Earl of Wemyss] mett upon the heigh gait of Edinburgh [the High Street], and they and their followers faught a *verey bloody skirmish*, wher ther wes maney hurte on both sydes by shote of pistole." The father of the subject of this memoir was descended from a cadet of the Bruces of Clackmannan, who, in the reign of James I. of Scotland, had married the eldest daughter of William de Airth, and succeeded to the inheritance. The Bruces of Clackmannan, from whom, we believe, all the Bruces of Stirlingshire, Clackmannanshire, Kinross, &c. (including the Earl of Elgin), are descended, sprung from a younger son of Robert de Bruce, the competitor with Baliol for the Scottish throne, and therefore uncle to King

Robert. The reader may perhaps remember the proud saying of the last lady of Clackmannan, who, on being complimented by Robert Burns as belonging to the family of the Scottish hero, informed the poet, that King Robert belonged to her family: it will be seen from our present statement that the old lady made a slight mistake.

While the eldest son of Sir Alexander Bruce was designed to inherit the property of Airth, a comparatively small appanage, consisting of the lands of Kinnaird, was appropriated to Robert; but to eke out his provision for life, he was devoted, like many other cadets of Scottish families, to the profession of the law. With a view to qualify him for the bar he was sent to Paris, where he studied the principles of Roman jurisprudence under the most approved masters. Afterwards returning to his native country, he completed his studies at Edinburgh, and began to conduct his father's business before the Court of Session. That court was then, like the other parts of government, corrupt and disordered; the judges were court partisans; and justice was too often dispensed upon the principles of an auction. Young Bruce, whose mind was already tinctured with an ardent sentiment of religion, shrunk appalled from a course of life which involved such moral enormities, and, without regarding the prospect of speedily becoming a judge, which his father, according to the iniquitous practice of the time, had secured for him *by patent!* he determined on devoting himself to the church. His parents, to whom the moral *status* of a clergyman in those days was as nothing compared with the nominal rank of a judge, combated this resolution by all the means in their power, not excepting the threatened withdrawal of his inheritance. But Bruce, who felt what he considered a spiritual call towards his new profession, resigned his pretensions to the estate without a sigh, and, throwing off the embroidered scarlet dress which he had worn as a courtier, exchanged his residence at Edinburgh for the academical solitude of St. Andrews, where he commenced the study of theology.

At this period Andrew Melville, the divinity professor of St. Andrews, was undergoing banishment on account of his opposition to the court; but being permitted to resume his duties in 1586, Bruce enjoyed the advantage of his prelections for the ensuing winter, and appears to have become deeply imbued with his peculiar spirit. In the summer of 1587 he was brought to Edinburgh by Melville, and recommended to the General Assembly as a fit successor to the deceased Mr. Lawson, who, in his turn, had been the successor of Knox. This charge, however, Bruce scrupled to undertake, lest he should be found unfit for its important duties; he would only consent to preach till the next synod, by way of trying his abilities. It appears that he filled the pulpit for some months, though not an ordained clergyman; which certainly conveys a strange impression of the rules of the church at that period. He was even persuaded, on an emergency, to undertake the task of dispensing the communion—which must be acknowledged as a still more remarkable breach of ecclesiastical rule. He was soon after called by the unanimous voice of the people to become their pastor; but partly perhaps from a conscientious aversion to ordination, and partly from a respect to his former exertions, he would never submit to any ceremonial, such as is considered necessary by all Christian churches in giving commission to a new member. He judged the call of the people and the approbation of the ministry to be sufficient warrant for his undertaking this sacred profession.

So rapidly did the reputation of Bruce advance

among his brethren, that, in six months after this period, at an extraordinary meeting of the General Assembly, which was called to consider the means of defence against the Spanish Armada, he was chosen *moderator*. A charge was preferred to this court against a preacher named Gibson, who had uttered disrespectful language in his pulpit regarding King James. The accused party was charged to appear, and, failing to do so, was suspended for contumacy. There can be no doubt that the church was most reluctant to proceed to such an extremity with one of its members on a court charge; and its readiness to do so can only be accounted for, as necessitated in some measure, by the avowed constitution of the church itself, which repeatedly set forth that it did not claim an exemption for its members from ordinary law, but only desired that an impeached individual should *first* be tried by his brethren. Accordingly we find the conscience of the moderator immediately accusing him in a strange way for having yielded a brother to lay vengeance; for, on that night, he thought he heard a voice saying to him, in the Latin language, "Why hast thou been present at the condemnation of my servant?" When the destruction of the Spanish Armada was known in Scotland, Bruce preached two thanksgiving sermons, which were published in 1591, and display a strength of sentiment and language fully sufficient to vindicate the contemporary reputation of the author to posterity.

Master Robert Bruce,¹ as he was styled in compliance with the common fashion of the time, figured conspicuously in the turbulent proceedings which, for some years after this period, characterized the ecclesiastical history of Scotland. By King James he seems to have been regarded with a mixture of respect, jealousy, and fear, the result of his powerful abilities, his uncompromising hostility to undue regal power, and the freedom with which he censured the follies and vices of the court. It was by no means in contradiction to these feelings that, when James sailed for Denmark in 1589 to bring home his queen, he raised Master Robert to the privy council, and invested him with a non-commissioned power of supervision over the behaviour of the people during his absence; telling him, at the same time, that he had more confidence in him and the other ministers of Edinburgh, than in the whole of his nobles. The king knew well enough that if he did not secure the exertions of the clergy on the side of the government during his absence they would certainly act against it. As might have been expected from the influence of the clergy, the usual disorders of the realm ceased entirely during the supremacy of this system of theocracy; and the chief honour of course fell upon Bruce. The turbulent Earl of Bothwell, who was the nominal head of the government, proposed, during James's absence, to make a public repentance for a life of juvenile profligacy. The strange scene, which exhibited the first man in the kingdom humbled for sin before an ordinary Christian congregation, took place on the 9th of November in the High Church. On this occasion Bruce preached a sermon from 2 Ti. ii. 22-26, which was printed among others in 1591, and abounds in good sense, and in pointed and elegant language. When the sermon was ended the Earl of Bothwell upon his knees confessed his dissolute and licentious life, and with tears in his eyes uttered the following words—"I wald to God, that I might mak sic a repentance as mine

¹ The affix *Master* appears to have been first used in Scotland as part of the style of the clergy. Throughout the whole of the seventeenth century it is not observed to have been applied to any other class of men.

heart craveth; and I desire you all to pray for it." But it was the repentance of Esau, and soon effaced by greater enormities.

On the return of King James with his queen, in May, 1590, Bruce received the cordial thanks of his majesty for his zeal in composing differences during his absence, and his care in tutoring the people to behave decently before the queen and her Danish attendants. He was also honoured with the duty of placing the crown upon the queen's head at her coronation; which was considered a great triumph on the part of the Presbyterian church over the titular bishops. In the ensuing June Bruce was himself married to Margaret, daughter of Douglas of Parkhead, a considerable baron, who some years after rendered himself conspicuous by slaying James Stuart, Earl of Arran, who had been the favourite of King James, and the arch-enemy of the Presbyterian polity. The parents of Bruce appear to have been now reconciled to him, for, on the occasion of his marriage, they gave him back his inheritance of Kinnaird.

The Protestant Church of Scotland had been so highly exasperated against the Catholics at the Reformation, and was now so imminently threatened by them, that its conduct in regard to that body at this period bears very much the aspect of persecution. Three Catholic earls, Huntly, Angus, and Errol, had entered into the views which Spain for some years entertained against both divisions of Britain; and they were now justly liable to the extreme vengeance of their sovereign for treason. James, however, never could be brought to put the laws fully in force against them, from a fear lest the Catholic party in general might thereby be provoked to oppose his succession to Elizabeth. The backwardness of James, and the forwardness of the clergy, in this cause, naturally brought them into violent collision, and as Bruce, next to Melville, was now the leader of the clergy, he became exceedingly odious to his sovereign. The following anecdote, related by an Episcopalian pamphleteer of a succeeding age, will illustrate their relative positions better than anything else. "It is to this day remembered," says Maxwell, Bishop of Ross, in *The Burden of Issachar*, printed 1646, "that when Master Robert Bruce came from his visitation in the east, returning to Edinburgh, and entering by the Canongate, King James, looking out at his window in the palace of Holyrood House, with indignation (which extorted from him an oath), said, 'Master Robert Bruce, I am sure, intends to be king, and declare himself heir to King Robert de Bruce.' At another time, wishing to recall the three banished lords, Angus, Huntly, and Errol, James attempted to gain the consent of Master Robert, who possessed more power in Edinburgh, through his command of consciences, than the sovereign himself. Being ushered into the king's bed-chamber, James opened unto him his views upon the English crown, and his fears lest the Papists in Scotland, of whom these lords were the chief, should contrive to join with their brethren in England, and raise obstacles to his succession. He continued, 'Do you not think it fit, Master Robert, that I give them a pardon, restore them to their honour and lands, and by doing so gain them, that thus I may save the effusion of Christian blood?' To this demand, so piously made, the answer was, 'Sir, you may pardon Angus and Errol, and recall them; but it is not fit, nor will you ever obtain my consent, to pardon or recall Huntly.' To this the most gracious king sweetly replied, 'Master Robert, it were better for me to pardon and recall him without the other two, than the other two without him: first, because you

know he hath a greater command, and is more powerful than the other two; secondly, you know I am more assured of his affection to me, for he hath married my near and dear kinswoman the Duke of Lennox his sister.' His rejoinder was, 'Sir, I cannot agree to it.' The king desiring him to consider it, dismissed him; but when sent for once more, Mr. Robert still continued inexorable: 'I agree with all my heart,' said he, 'that you recall Angus and Errol; but for Huntly it cannot be.' The king resumed, and repeated his reasons before mentioned, and added some more; but he obstinately opposed and contradicted it. . . . King James desired his reasons; he gave none, but spoke majestically. Then the king told him downright, 'Master Robert, I have told you my purpose; you see how nearly it concerneth me; I have given you my reasons for my resolutions; you give me your opinion, but you strengthen it not with reasons. Therefore, I will hold my resolution, and do as I first spoke to you.' To which, with Christian and subject-like reverence, Bruce returned this reply, 'Well, sir, you may do as you list; but choose you, you shall not have me and the Earl of Huntly both for you.'" Though this tale is told by an enemy, it bears too many characteristic marks to be altogether false; and certainly it presents a most expressive picture of the comparative importance of the leader of the Scottish church and the leader of the Scottish state. Maxwell insinuates interested and unworthy motives for Bruce's conduct on this occasion; but the whole tenor of the man's life disproves their reality. There can be no doubt that he was actuated solely by a fear for the effect which Huntly's great territorial influence might have upon the Scottish church. To show that his conduct on this occasion was by no means of an uncommon kind, we may relate another anecdote. On the 6th of June, 1592, the king came to the Little Kirk, to hear Bruce's sermon. In his discourse Bruce moved the question, "What could the great disobedience of the land mean now, while the king was present? seeing some reverence was borne to his shadow while absent." To this he himself answered, that it was the *universal contempt of his subjects*. He, therefore, exhorted the king "to call to God, before he either ate or drank, that the Lord would give him a resolution to execute justice on malefactors, although it should be with the hazard of his life: which, if he would enterprise courageously, the Lord would raise enough to assist, and all his impediments would vanish away. Otherwise," said he, in conclusion, "you will not be suffered to enjoy your crown alone, but every man will have one." When we find the king obliged to submit to such rebukes as this before his subjects, can we wonder at his finding it a difficult task to exact obedience from those subjects either to himself or the laws?

The extraordinary power of the Scottish church came at length to a period. During a violent contention between the church and court in 1596, the partisans of the former were betrayed by their zeal into a kind of riot, which was construed by the king into an attack upon his person. The reaction occasioned by this event, and the increased power which he now possessed in virtue of his near approach to the English throne, enabled him to take full advantage of their imprudence in imposing certain restrictions upon the church of an Episcopalian tendency. Bruce, who preached the sermon which preceded the riot, found it necessary, though not otherwise concerned, to flee to England. He did not procure permission to return for some months, and even then he was not allowed to resume his functions as a parish minister. For some time he officiated privately in

the houses of his friends. Nor was it till after a long course of disagreeable contentions with the court that he was received back into one of the parochial pulpits of Edinburgh.

This was but the beginning of a series of troubles which descended upon the latter half of Bruce's life. In August, 1600, the king met with the strange adventure known by the name of the Gowrie conspiracy. When he afterwards requested the ministers of Edinburgh to give an account of this affair to their congregations, and offer up thanks for his deliverance, Bruce happened to be one of a considerable party who could not bring themselves to believe that James had been conspired against by the two young Ruthvens, but rather were of opinion that the whole affair was a conspiracy of his own to rid himself of two men whom he had reason to hate. To King James, who wished to impress the nation with a sense of his wonderful deliverance, this scepticism was exceedingly annoying, for more reasons than one; and accordingly it was not surprising that he should have been disposed to take the sharpest measures with a recusant of so much popular influence as Bruce. "Ye have heard me, ye have heard my minister, ye have heard my council, ye have heard the Earl of Mar," exclaimed the enraged monarch; yet all would not do. The chancellor then pronounced a sentence dictated by the council, prohibiting Bruce and three of his brethren to preach in the kingdom under pain of death.

Bruce was not the man to be daunted or driven from his purpose when the liberties of his church and the maintenance of a good conscience were concerned. He had made up his mind to withstand, at all hazards, the now undisguised machinations of his infatuated monarch to crush the Presbyterian cause. In 1596, when the privy council was prosecuting David Black, minister of St. Andrew's, for certain expressions he had uttered in the pulpit, Bruce headed a deputation of ministers to the king, to endeavour to bring about an accommodation. He declared with solemn earnestness, on behalf of himself and his associates, "that if the matter concerned only the life of Mr. Black, or that of a dozen others, they would have thought it of comparatively trifling importance; but as it was the liberty of the gospel, and the spiritual sovereignty of the Lord Jesus, that was assailed, they could not submit, but must oppose all such proceedings, to the extreme hazard of their lives." This declaration moved the king at the time, and wrung tears from his eyes; but the relentings of his better nature were soon overcome by his courtiers. He was but too anxious to get so formidable an opponent as Bruce out of the way, and the present occasion afforded him a favourable opportunity. Bruce, after spending some time as a prisoner in Airth, his paternal seat, embarked at Queensferry on the 5th of November, 1600, for Dieppe, in Normandy, which he reached in five days. Next year he was allowed to return to his native country, although not to reside in Edinburgh. He had two interviews with James, one of them at the very moment when his majesty mounted horse on his journey to England. But the minions of the court and friends of the Episcopal religion contrived to prevent his offers of submission from having their due weight. He was formally deposed in 1605, and sent to Inverness, which was then a frequent place of banishment for obnoxious clergymen. There he remained for eight years, only exercising his gifts in a private way, but still with the best effect upon the rude people who heard him. In 1613 his son procured permission for his return to Kinnaird, upon the condition that he would confine himself to that place. There, however, he soon

found himself very painfully situated on account of the comparatively dissolute manners of the neighbouring clergy, who are said to have persecuted him in return for the freedom he used in censuring their behaviour. He obtained leave from the privy council to retire to a more sequestered house at Monkland, near Bothwell, where, however, he soon attracted the notice of the Bishop of Glasgow on account of the crowds which flocked to hear him. He was obliged to return to Kinnaird. In 1621 the Scottish parliament was about to pass the famed articles of Perth, in order to bring back something like uniformity with England in the national system of worship. Bruce could not restrain his curiosity to witness this awful infliction upon the church; he took advantage of some pressing piece of private business to come to Edinburgh. The bishops watched the motions of their powerful enemy with vigilance, and he was soon observed. They entered a petition and complaint before the council, and he was committed to Edinburgh Castle for several months, after which he was again banished to Inverness. Some of the lords of the council who were his friends wrote to court, in order to have the place of confinement fixed at his family seat; but James had heard of the effect of his preachings at that place, and returned for answer—"It is not for the love of him that ye have written, but to entertain a schism in the kirk; we will have no more popish pilgrimages to Kinnaird (in allusion to the frequent intercourse between Bruce and the pious people of the surrounding country); he shall go to Inverness." The king never forgave his scepticism of the Gowrie conspiracy, although this was the occasion rather than the cause of the persecution which tracked him in his latter years. He remained at Inverness till the death of James, in 1625, when he obtained permission once more to reside at his own house. He was even allowed, for some time after this, to preach in several of the parish churches around Edinburgh, whither large crowds flocked to hear him. At length, in 1629, Charles wrote to the council, requesting that he might again be confined to Kinnaird, or the space of two miles around it. The church of Larbert having been neglected by the bishops, and left in ruins without either minister or stipend, he had repaired it at his own expense; and now finding it within the limits of his confinement, he preached there every Sunday to a numerous and eager audience. At one of his sermons, either in that church or in the neighbourhood, he gained a proselyte who vindicated his cause, and that of Presbyterians in general, a few years after. This was the celebrated Alexander Henderson, minister at Leuchars, in Fife, whom he was the means of converting, by preaching from the first verse of the tenth chapter of St. John's Gospel.

Bruce had now lived to see the Scottish Presbyterian church altered for an imperfect Episcopacy, and as he prepared for the fate which threescore and ten years had long marked out for him, he must have felt convinced that what remained of his favourite system could not long survive him. The revival of the Presbyterian polity, in all its primitive glory, was reserved in its proper time for his pupil Henderson. Exhausted with the infirmities of age, he was for some time almost confined to his chamber; yet, as he laboured under no active disease, his end advanced slowly. On the 13th of August, 1631, having breakfasted with his family in the usual manner, he felt death approaching, and warned his children that his Master called him. With these words he desired a Bible to be brought, and finding that his sight was gone, he requested his daughter to place his hand on the two last verses of chap. viii. of the

Romans. These were highly expressive of his life, his resolution, and his hopes. When his hand was fixed on the words, he remained for a few moments satisfied and silent. He had only strength to add, "Now God be with you, my children; I have breakfasted with you, and shall sup to-night with the Lord Jesus Christ." He then closed his eyes and peacefully expired.

Such was the end of the long and varied life of Robert Bruce. His bold and comprehensive mind, his stern independence, and stainless integrity, are qualities which, under every disadvantage, procure the respect of mankind, and indicate superior character. Less violent than Melville, more enlightened than Knox, he viewed with a brighter and milder eye the united interests of the church and nation. Had he chosen to accommodate himself to the temporizing spirit of the age, he might have stood high in royal favour, and become, in point of political influence, the first man of the age. But the true greatness of his character as a Christian minister and a patriot, which shone brightest in adversity, would never have appeared; nor would the services have been rendered to his church and country which contributed to secure to them those blessings of national freedom and liberty of conscience which have descended to our own times, and which it should be our study to preserve and transmit to future generations. James VI. found in men like Bruce, and in the church of which he was an ornament, formidable obstacles to the civil and spiritual despotism which he had destined for his Scottish subjects; hence his fear of both was equal to his dislike. Impartial history indorses not the later but the earlier judgment of the king, who was so sensible of the valuable services of the church in preserving public tranquillity during his absence in Denmark on the occasion of his marriage, that in his letters to Bruce he declared that he was "worth the quarter of his kingdom."

The person of Robert Bruce was tall and dignified. His countenance was majestic, and his appearance in the pulpit grave, and expressive of much authority. His manner of delivery was, in the words of a Presbyterian historian, "an earthquake to his hearers, and he rarely preached but to a weeping auditory." It is told, as an instance of the effect of his sermons, that a poor Highlander one day came to him after he had concluded, and offered to him his whole wealth (two cows), on condition that he would make God his friend. Accustomed to continual prayer and intense meditation on religious subjects, his ardent imagination at times appears to have lost itself in visions of the divine favour; a species but natural illusion, by which the most virtuous minds have been deceived and supported when reason and philosophy have been summoned in vain. His knowledge of the Scriptures was extensive, and accurate beyond the attainment of his age. His skill in the languages, and the sciences of those times, not to mention his acquaintance with the laws and constitution of the kingdom, a branch of knowledge possessed by few of his brethren, was equal, if not superior, to that of any of the Scottish reformers. His sermons, of which sixteen were printed in his lifetime, display a boldness of expression, regularity of style, and force of argument, seldom to be found in the Scottish writers of the sixteenth century. A translation of their rich idiomatic Scottish into the English tongue was printed in 1617, and is that which is now most common in Scotland.

This great man was buried within the church of Larbert, in which he had often preached during the

latter part of his life. People assembled from all quarters to attend his funeral; and, according to Calderwood, between four and five thousand persons followed his corpse to the grave. It is impossible to conclude this narrative of his life, without remarking how much of his person and character revived in the Abyssinian Bruce, his descendant in the sixth degree, whose person was also majestic, and whose mind, while diminished a little in utility by hasty passion and a want of accommodation to circumstances, was also of the most powerful cast, and calculated to produce a great impression upon those around it.

BRUNTON, MRS. MARY, an eminent moral novelist of the present century, was born in the island of Barra, in Orkney, November 1, 1778. Her father was Colonel Thomas Balfour of Elwick, a cadet of one of the most respectable families in the county of Orkney. Her mother was Frances Ligonier, only daughter of Colonel Ligonier of the 13th dragoons, and niece of the Earl of Ligonier, under whose care she was educated. Previous to her sixteenth year, Mary Balfour had received some instructions in music, and in French and Italian, from her mother, and her education was completed by a short residence at a boarding-school in Edinburgh. At the early age mentioned, she had to undertake the charge of her father's household, from which she was removed in her twentieth year, to be the wife of the Rev. Alex. Brunton, minister of the parish of Bolton in East Lothian. In the retirement and moderate elegance of a Scottish manse, Mrs. Brunton was only at first conspicuous for her attention to her household duties. Afterwards, however, the tastes of her husband led her gradually into habits of study, and she went, with his direction and assistance, through a course of reading in history, philosophy, criticism, and the belles lettres. The promotion of her husband to a ministerial charge at Edinburgh, which took place six years after her marriage, was favourable to the expansion and improvement of her intellect, by introducing her into a circle of society more enlightened than any in which she had hitherto moved. The native powers of her mind were slowly developed; she ripened from the simple housewife into the clear-minded and intelligent *savante*. Yet for many years she was only known as a well-informed but perfectly unpretending female. So far from displaying any disposition to active literature, she felt the composition of a letter to be burdensome. A trivial circumstance is said to have operated, with several other causes, in inducing her to attempt a regular work. She had often urged her husband to undertake some literary production, and once she appealed to an intimate friend, who was present, whether he would not publish it. This third party expressed a ready consent, but said he would at least as willingly publish a book of her own writing. This seemed at the time to strike her with a sense of her powers hitherto not entertained, and she asked more than once whether he was in earnest. She then appears to have commenced her novel entitled *Self-Control*, of which she had finished a considerable part of the first volume before making even her husband privy to her design. In 1811 the work was published at Edinburgh, in two volumes, and the impression which it made upon the public was immediate and decisive. It was acknowledged that there were faults of a radical and most unfortunate kind—such as the perpetual danger to which the honour of the heroine was exposed (an intolerable subject of fictitious writing), but every one appreciated the beauty and correctness of the style, and the acuteness of observation and loftiness of senti-

ment which pervaded the whole. The modesty of Mrs. Brunton, which was almost fantastic, induced her to give this composition to the world without her name. Four years afterwards she published a second novel in three volumes, entitled *Discipline*, which was only admired in a degree inferior to the first. She afterwards commenced a third tale under the title *Emmeline*, which she did not live to finish.

Mrs. Brunton had been married twenty years without being blessed with any offspring. In the summer of 1818, when a prospect of that blessing occurred, she became impressed with a belief that she should not survive. With a tranquillity, therefore, which could only be the result of great strength of mind, joined to the purest sentiments of religion and virtue, she made every preparation for death, exactly as if she had been about to leave her home upon a journey. The clothes in which she was to be laid in the grave were selected by herself; she herself had chosen and labelled some tokens of remembrance for her more intimate friends; and she even prepared, with her own hand, a list of the individuals to whom she wished intimations of her death to be sent. Yet these anticipations, though so deeply fixed, neither shook her fortitude nor diminished her cheerfulness. They neither altered her wish to live, nor the ardour with which she prepared to meet the duties of returning health, if returning health were to be her portion.

To the inexpressible grief of her husband and friends, and, it may be said, of the literary world at large, the unfortunate lady's anticipations proved true. On the 7th of December she gave birth to a still-born son, and for some days recovered with a rapidity beyond the hopes of her medical attendants. A fever, however, took place, and, advancing with fatal violence, terminated her valuable life on the 19th, in the 41st year of her age.

The whole mind and character of Mrs. Brunton was "one pure and perfect chrysolite" of excellence. We are so agreeably anticipated in an estimate of her worth by an obituary tribute paid to her memory by Mrs. Joanna Baillie, that we shall make no scruple for laying it before the reader:—

"No more shall bed-ridden pauper watch
The gentle rising of the larch,
And as she enters shift his place,
To hear her voice and see her face.
The helpless vagrant, oft relieved,
From her hath his last dole received.
The circle, social and enlightened,
Whose evening hours her converse brightened,
Have seen her quit the friendly door,
Whose threshold she shall cross no more.
And he, by holy ties endeared,
Whose life her love so sweetly cheer'd,
Of her cold clay, the mind's void cell,
Hath ta'en a speechless last farewell.
Yes, those who never saw her face,
Now did on blue horizon trace
One mountain of her native land,
Nor turn that leaf with eager hand,
On which appears the unfinished page,
Of her whose works did oft engage
Untir'd attention, interest deep,
While searching, healthful thoughts would creep
To the heart's core, like balmy air,
To leave a kindly feeling there,—
And gaze, till stain of fallen tears
Upon the snowy blank appears.
Now all who did her friendship claim
With altered voice pronounce her name,
And quickly turn, with wistful ear,
Her praise from stranger's lip to hear,
And heard, as saintly relics gain'd,
Aught that to her hath e'er pertain'd."

The last beautiful allusion is to the unfinished tale of *Emmeline*, which was published by her husband, Dr. Brunton (late professor of oriental languages in the university of Edinburgh), along with a brief, but most elegant and touching memoir of her life.

BRYCE, The Rev. ALEXANDER, an eminent geometrician, was born in the year 1713, at Borland in the parish of Kincardine, and received the first rudiments of learning at the school of Downe, Perthshire. He studied afterwards at the university of Edinburgh, where his proficiency in mathematics and practical astronomy early attracted the notice, and secured for him the patronage, of Professor Maclaurin. At the particular request of that celebrated man, he went to Caithness, in May, 1740, as tutor to a gentleman's son, but chiefly to construct a map of the northern coast; the number of shipwrecks rendering this, at the time, an object of considerable national importance. During a residence of three years, and in defiance of many threats from the peasantry (which made it necessary for him to go always armed), who did not relish so accurate an examination of their coast, from motives of disloyalty, or because they were afraid it would deprive them of two principal sources of income—smuggling and plunder from the shipwrecks—he accomplished, at his own expense, the geometrical survey, and furnished "A Map of the North Coast of Britain, from Raw Stour of Assynt, to Wick, in Caithness, with the Harbours and Rocks, and an Account of the Tides in the Pentland Firth." This map was afterwards published by the Philosophical, now the Royal, Society of Edinburgh in 1744. Mr. Arrow-smith, it may be mentioned, pronounced it to be very accurate, after a minute examination, while preparing materials for his large map of Scotland.

On his return to Edinburgh, in 1743, Mr. Bryce gave very efficient aid, with his friend the Rev. Mr. Wallace of Haddo's Hole church, in verifying the necessary calculations submitted to them by Dr. Webster, previous to the institution, by act of parliament, of the fund for a provision for the widows of the Scottish clergy; the regular increase of which since, and its present flourishing state, form the best encomium of those who laboured for its establishment.

In June, 1744, he was licensed to preach by the reverend presbytery of Dunblane; and having received a presentation by James, Earl of Morton, to the church and parish of Kirknewton, within the presbytery of Edinburgh, he was ordained to serve that cure, in August, 1745. From his knowledge of the inland geography of Scotland, and line of the roads, he was enabled, this year, to furnish the quartermaster-general of the army of the Duke of Cumberland with important information regarding the march of the forces in subduing the rebellion. In the winter of 1745, and spring of 1746, he taught the mathematical classes in the university of Edinburgh, at the desire, and during the last illness, of Professor Maclaurin, who died in June following. Mr. Bryce expressed his sorrow for the loss of his friend, in verse, of which the following is a specimen:—

"Yon angel guards that wait his soul,
Amaz'd at sight from earth so bright,
Find nothing new, from pole to pole,
To show him in a clearer light.

"Joyful he bears glad news¹ on high,
And tells them through celestial space;
See Newton hastens down the sky,
To meet him with a warm embrace!

¹ A few days before his friend's death, he saw him institute a calculation for ascertaining the proportion that existed between the axis of the earth and the diameter of its equator. It proceeded on data sent him by the Earl of Morton, president of the Royal Society, consisting of observations made in Peru by the French mathematicians, and communicated at London by Don Antonio, who was taken prisoner at Cape Breton. The proportion ascertained was very nearly that which Sir Isaac Newton had predicted; being as 221 : 202, and afforded particular gratification. These are the news he is supposed to bear.

"The list'ning choirs around them throng,
Their love and wonder fond to show;
On golden harps they tune the song
Of Nature's laws in worlds below.

"O Forbes, Foulks, loved Merton, mourn;
Edina, London, Paris, sigh;
With tears bedew his costly urn,
And pray—Earth light upon him lie."

In the year 1750, having occasion to visit Stirling, and knowing that, by an act of the Scottish parliament, this borough had the keeping of the pint jug, the standard, by special statute, for weight and for liquid and dry measure in Scotland, he requested a sight of it from the magistrates. Having been referred to the council house, a *pevter pint jug* which had been kept suspended from the roof of the apartment, was taken down and given to him. After minutely examining it, he was convinced that it could not be the standard. The discovery was in vain communicated to the magistrates, who were ill able to appreciate their loss. It excited very different feelings in the mind of an antiquary and a mathematician; and resolved, if possible, to recover this valuable antique, he immediately instituted a search, which, though conducted with much patient industry during part of this and the following year, proved unavailing. In the spring of 1752 it occurred to him that this standard might have been borrowed by some of the braziers or coppersmiths, for the purpose of making legal measures for the citizens; and having learned that a person of this description, called Urquhart, had joined the rebel forces in 1745; that his furniture and shop utensils had been brought to public sale on his not returning; and that various articles which had not been sold were thrown into a garret as useless, he obtained permission to inspect them; and, to his great satisfaction, discovered, under a mass of lumber, the precious object of his long research. Thus was recovered the only legal standard of weight and measure in Scotland, after it had been offered, in ignorance, for public sale, and thrown aside unsold as trash, and long after it had been considered by its *constitutional guardians* as irretrievably lost.

The standard Stirling pint jug is made of brass, in the form of a hollow truncated cone, and weighs 14 pounds, 10 ounces, 1 drop, and 18 grains, Scotch troy. The mean diameter of the mouth is 4.17 inches. The mean diameter of the bottom 5.25 inches, and the mean depth 6 inches English. On the front, near the mouth, in alto-relievo, is a shield and lion rampant, the arms of Scotland; and near the bottom another shield, and an ape, passant gardant, with the letter S below, supposed to have been intended as the arms of Stirling. The arms at present are a wolf. The ape must have been put on therefore inadvertently by the maker, or the town must have changed its arms at a period subsequent to the time when the standard was ordered to be made. The handle is fixed with two brass nails; the whole is of rude workmanship, and indicates great antiquity.

By an act of the Scottish parliament, Edinburgh had the keeping of the standard ell, Perth the reel, Lanark the pound, Linlithgow the firloft, and Stirling the *pint jug*, an arrangement made by the legislature, in the view of improving the internal commerce of the country, by checking the frauds which the traffickers of a rude age may be supposed to have often attempted, and because the commodities to which these different standards referred, were known to have been supplied in greater abundance by the districts and towns to whose care they were respectively committed. Hence it may be inferred that Lanark was then the principal market for wool,

Perth for yarn, Edinburgh for cloth, Linlithgow for grain, and Stirling for distilled and fermented liquors. The Stirling jug is mentioned in acts of parliament as being in the town before the reign of James II. in 1437; and the last mention made of it is in the reign of James VI., in an "act of parliament, 19 February, 1618, anent settling the measures and weights of Scotland." No accurate experiments appear to have been afterwards made with it for fixing the legal quantity of these measures and weights, till the following by Mr. Bryce, in 1762-3, a period of about 135 years!

Having been permitted, after recovering the standard jug, to carry it with him to Edinburgh, his first object was to ascertain precisely, by means of it, the number of cubic inches, and parts of a cubic inch, in the *true Scotch pint*.

For this purpose the mouth of the jug was made exactly horizontal, by applying to it a spirit level; a minute silver wire of the thickness of a hair, with a plummet attached to each end, was laid across the mouth, and water poured gently in till, with a magnifying glass, it was seen just to touch the wire: the water was then carefully weighed in a balance, the beam of which would turn with a single grain when 96 ounces were in each scale. After seventeen trials with clear spring and river water, several of which were made in presence of the magistrates of Edinburgh, the content of the jug was found to weigh, at a medium of the trials, 54 ounces, 8 drops, 20 grains, or 26,180 grains, English troy.

His next object was to determine accurately how many of these grains were contained in a cubic inch of water. With this view, a cylindrical brass vessel was made with great accuracy, by a scale of Bird, the celebrated mathematical instrument-maker of London, to contain 100 cubic inches. This vessel was filled several times with the same water as in the trials with the jug, and its content was found to weigh 25,318 grains, English troy. This number, divided by 100, gives $253\frac{18}{100}$ grains as the weight of a cubic inch of water: therefore, $\frac{26180}{253\frac{18}{100}} = 103\frac{404}{1000}$.

the exact number of cubic inches, and parts of a cubic inch, in the standard Scotch pint: $51\frac{7.62}{1000}$ cubic inches in the chopin: $25\frac{30.75}{1000}$ cubic inches in the mutchkin; and so on proportionally in the other smaller Scotch measures.

Mr. Bryce next applied the standard jug to fix the legal size of the different measures for grain; which he compared with some of the English dry measures. By act of parliament, February 19, 1618, formerly mentioned, it is ordained that the *wheat and pease firloft* shall contain $21\frac{1}{4}$ pints; and the *bear and oat firloft* 31 pints of the just Stirling jug. Therefore, since there are $103\frac{404}{1000}$ cubic inches in the standard Scotch pint, there will be 2197 $\frac{856}{1000}$ cubic inches in the wheat and pease firloft; $549\frac{552}{1000}$ in the peck; and $137\frac{3234}{10000}$ in the lippie—in the bean and oat firloft, $3205\frac{624}{10000}$ cubic inches; $801\frac{1081}{10000}$ in the peck; and $200\frac{744}{10000}$ in the lippie. The excess of a boll of bear above a boll of wheat was found to be precisely 5 pecks bear measure, and 1 mutchkin, without the difference of a single gill: or, a boll of bear is more than a boll of wheat by 7 pecks $1\frac{1}{2}$ lippie, wheat measure, wanting 1 gill.

The English corn bushel contains 2178 cubic inches, which is less than the Scotch wheat firloft by $19\frac{335}{1000}$ inches, or three gills; so that 7 firlofts of wheat will make 7 English bushels and 1 lippie. The English corn bushel is less than the barley firloft by 1 peck $3\frac{1}{2}$ lippies nearly.

The legal English bushel, by which gaugers are ordered to make their returns of malt, contains

2150·42 cubic inches, which is less than the wheat firloft by 46·915 cubic inches, or 1 chopin, wanting $\frac{1}{2}$ gill; and less than the bear firloft by 1055·104 cubic inches, or 2 bear pecks, wanting 7 gills.

A Scotch barley boll contains 5 bushels, 3 pecks, 2 lippies, and a little more, according to the Winchester gallon.

A Scotch barley boll, according to the legal measure, contains 6 bushels, wanting a little more than $\frac{1}{2}$ lippie.

A Scotch chald (16 bolls of barley) is equal to 11 quarters, 6 bushels, and 3 lippies, Winchester measure.

A Scotch chald of wheat is equal to 8 quarters, 2 pecks, and 1 lippie, Winchester measure.

A wheat firloft made according to the dimensions mentioned in the Scotch act of parliament, 1618, viz. 19 $\frac{1}{2}$ inches diameter at top and bottom, and 7 $\frac{1}{2}$ inches in height, Scotch measure, would be less than the true wheat firloft (or 21 $\frac{1}{2}$ pints of the standard jug) by a Scotch chopin: a chald of wheat measured with this firloft would fall short of the true quantity 1 firloft 2 pecks, or nearly 2 $\frac{1}{2}$ per cent.

A barley firloft made according to the dimensions in the said act, viz. having the same diameter at top and bottom as the wheat firloft, and 10 $\frac{1}{2}$ inches in height, Scotch measure, would be less than the true firloft (or 31 pints of the standard jug) by 5 mutchkins: and a chald of bear, measured with such a firloft, would fall short of the just quantity 2 firlofts, 2 pecks, and nearly 2 lippies, or 4 per cent.

These very remarkable mistakes must have proceeded from the ignorance or inaccuracy of the persons authorized by parliament to make the calculations, and to determine the exact dimensions of the firloft measure. For, suppose a firloft were made of the following dimensions, viz. 20 inches diameter, English measure, at top and bottom, and 7 inches in depth, it would contain 21 $\frac{1}{2}$ pints (the true wheat and pease firloft) and only $\frac{1}{2}$ of a gill more.

A firloft of the same diameter as above, at top and bottom, and 10 $\frac{1}{2}$ inches in depth, would contain 31 pints (the true bear and oat firloft) and only 2 gills more: but if, instead of 10 $\frac{1}{2}$, it be made 10 $\frac{1}{4}$ inches in depth, it will be less than 31 pints (the true standard measure), only $\frac{1}{4}$ of a single gill.

By the greater of these firlofts were to be measured bear, oats, and malt; by the less wheat, rye, beans, pease, and salt.

According to the act of parliament in 1618, to which reference has been made, the Scotch pint contains of the clear running water of Leith three pounds and seven ounces, French troy weight, and this is ordained to be the weight of Scotland; therefore, in the Scotch pound there are 7616 troy grains; and in the Scotch ounce 476 troy grains, and so on proportionally with regard to the other Scotch weights.

In this way, by the recovery of the standard Stirling pint jug, canons of easy application resulted for determining the just quantity of the measures, liquid and dry, and also of the weights in Scotland, and therefore of great public utility, by settling disputes and preventing litigation in that part of the empire.

After having obtained the above results by means of the standard jug, Mr. Bryce superintended, at the desire of the magistrates of Edinburgh, the adjustment of the weights and measures kept by the Dean of Guild; and "for his good services to the city," was made a Burgess and Guild brother in January, 1754.

Several detached articles by Mr. Bryce were published by the Royal Society of London, particularly *An Account of a Comet observed by him in 1766; A New Method of Measuring the Velocity of the Wind; An Experiment to ascertain to what*

Quantity of Water a fall of Snow on the Earth's Surface is equal. His observations on the transits of Venus, 6th June, 1761, and 3d June, 1769, were considered by astronomers as important in solving the grand problem. In May, 1767, he was consulted by the trustees for procuring surveys of the lines proposed for the canal between the Forth and Clyde, and received their thanks for his remarks, afterwards communicated to them in writing, on Mr. Smeaton's first printed report. About this time he was introduced to Stuart Mackenzie, lord privy-seal of Scotland, who, as a lover of the arts and sciences, highly respecting his genius and acquirements, obtained for him soon after the office of one of his majesty's chaplains in ordinary; and, during the remainder of his life, honoured him with his friendship and patronage.

He planned for that gentleman the elegant observatory at Belmont Castle, where also are still to be seen an instrument contrived by him for ascertaining the magnifying powers of telescopes, and a horizontal marble dial, made with great precision, to indicate the hour, the minute, and every ten seconds. In 1770, his lordship having communicated an account of a phenomenon observed by Lord Charles Cavendish, Dr. Hadden, and himself, viz. "that a less quantity of rain (by a difference which was considerable) fell into the rain-gauges placed on the top of Westminster Abbey and an adjoining house than into those placed below," and for which they found it difficult to account, Mr. Bryce sent to his lordship, on the 14th December, an ingenious solution of the fact. In 1772 he wrote *Remarks on the Barometer for Measuring Altitudes*; showing the uncertainty and limited use of the instrument as then commonly used for that purpose, and the means by which it might be rendered more perfect and greater precision attained. These remarks were sent to lord privy-seal in January, 1773. In a map of the Three Lothians, engraved by Kitchen of London, and published in 1773 by Andrew and Mostyn Armstrong, "the scales of longitude and latitude are laid down agreeably to the observations of the Rev. Mr. Bryce at Kirknewton manse." In April, 1774, in consequence of certain apparently insurmountable difficulties, he was consulted by the magistrates of Stirling on the subject of supplying the town with water: these difficulties he removed by taking accurately all the different levels; making the calculations for the size of the leaden pipes and the reservoir, and fixing the situation for its being placed. For this service he had the freedom of the town conferred on him. In 1776 he made all the requisite calculations for an epitome of the solar system on a large scale, afterwards erected by the Earl of Buchan at his seat at Kirkhill. In case of disputes about the extent of fields exchanged by neighbouring proprietors, or the line of their marches, he was generally chosen sole arbiter, and from his knowledge in land-surveying, and the confidence reposed in him, had it often in his power to render them essential service. Mr. Bryce used to send various meteorological observations and other detached notices to *Ruddiman's Weekly Magazine*.

From the time of his ordination, in 1745, till his death on the 1st January, 1786, he discharged with great fidelity all the duties of his pastoral office, and excelled particularly in that species of didactic discourse known in Scotland under the name of lecture. His lectures, however, were never fully written, but spoken from notes; and he left no sermons for publication.

In early life he composed several songs, adapted to some of the most favourite Scottish airs, and his

stanzas, in *The Birks of Invermay*, have been long before the world. For about three years before his death his greatest amusement was in writing poetry, chiefly of a serious and devotional cast; which, though not composed for the public eye, is read with satisfaction by his friends, and valued by them as an additional proof of his genius, and a transcript of that enlightened piety, uprightness of mind, and unshaken trust in his Creator, which characterized him through the whole of life.

BRYDONE, PATRICK, F.R.S., the well-known author of *A Tour in Sicily and Malta*, one of the most entertaining works in the language, was the son of the parish minister of Coldingham, Berwickshire, and was born at Coldingham in 1741. Having received an excellent university education, which qualified him for the duties of a travelling preceptor, he was engaged in that capacity, first by Mr. Beckford, of Somerly in Suffolk, and afterwards Mr. Fullarton, who was known in after-life as commander of a large body of troops in India, and finally as one of the three commissioners for the government of Trinidad. His excursion with the former gentleman took place in 1767-8; the latter in 1770. In the second tour he visited Sicily and Malta, which were then almost unknown to the English. Having written an account of this journey in a series of letters to Mr. Beckford, he was induced, by a consideration of the uninformed state of the British public upon this subject, to publish his work in 1773, under the title of *A Tour through Sicily and Malta*. This work is not only a most original and amusing narrative, but it contains a great deal of scientific knowledge, especially regarding the temperature of the air, which was the object of Mr. Brydone's particular study. For the purpose of carrying on his scientific observations, he travelled with an apparatus as perfect as could then be procured, or as it was possible to carry in the luggage of a traveller. Having returned to England in 1771, he obtained a respectable appointment under government, and after the publication of his travels, which procured for him no common share of reputation and respect, was nominated a member of several learned societies, particularly of the Royal Society, London. In the *Transactions* of this learned body are several papers of Mr. Brydone, chiefly on the subject of electricity, of which he was a profound student, and a close and anxious observer. He spent the latter part of his life in retirement at Lennel House, near Coldstream, where he was visited by the most distinguished persons in literature and public life. The author of *Marmion* has introduced into that work the following episode respecting Mr. Brydone:—

"Where Lennel's convent closed their march:
There now is left but one frail arch,
Yet mourn thou not its cells;
Our time a fair exchange has made;
Hard by, in hospitable shade,
A reverend pilgrim dwells,
Well worth the whole Bernardine brood,
That e'er wore sandal, frock, or hood."

Patrick Brydone died at Lennel in 1818, at an advanced age.

BRYSON, ALEXANDER. This talented Edinburgh citizen, who, though employed in a mechanical profession, won for himself a distinguished scientific reputation, was the eldest son of Robert Bryson, who founded the well-known firm of watchmakers in the Scottish capital. Alexander was born at No. 5 South Bridge, on the 14th October, 1816. After the usual course of education at the high-school, being destined to follow his father's occupation, he

was apprenticed to a watchmaker at Musselburgh; and at the expiration of his indenture, he went to London, to perfect himself in the art of watch and clock making. He was not, however, contented with the mere mechanical details of his trade, or the superior correctness of his time-keepers—and perhaps it was the very nature of these that strengthened his original aptitude for scientific inquiry, and fitted him for the pursuits of physical science. At all events, the patience and exactitude so essential in the art of watchmaking he transferred to his scientific pursuits; and on his return to Edinburgh, where he entered into partnership with his brother, he also enrolled himself as a student at the university, and attended the classes of chemistry and natural philosophy taught by Professors Hope and Forbes. He became a regular attendant of the School of Arts, in founding which his father and Mr. Leonard Horner had taken a very active part; and from a student, Alexander Bryson rose to the rank of a fellowship in the society, and finally to the president's chair. He also became president of the Royal Physical Society. Besides holding an honoured place in these scientific associations, Mr. Bryson was a fellow of the Royal Society of Edinburgh, and of the Geological Society of London. His great attainments in science also procured him the esteem of some of the most distinguished scientific men of the day. With that eminent naturalist, Dr. Fleming, of Aberdeen college, and afterwards of the new college, Edinburgh, Mr. Bryson was on terms of close intimacy for many years. He joined the professor in his geological excursions, and was a strenuous defender of his opinions; and when Fleming died, the excellent memoir that appeared of him in the *Transactions* of the Royal Society of Edinburgh was from the pen of Bryson. He was also on terms of intimate friendship with the late Sir Thomas Macdougall Brisbane, of whom he published an interesting memoir in the *Transactions* of the Royal Society, of which Sir Thomas was for many years the president. But the most substantial proof of the esteem in which he was held by men who could appreciate his attainments, was given by the late Mr. Nicol, the inventor of the well-known prism which bears his name. With him in early life Mr. Bryson formed a close friendship, the natural consequence of mutual sympathy in their studies and pursuits; and when Nicol died, he bequeathed to his young friend not only his fine library and collection of minerals, but also his property. By this handsome bequest Bryson was independent of his professional business, and enabled more closely to devote himself to his favourite studies in after-life.

It was perhaps in consequence of his devotedness to natural science in general, instead of restricting himself to one particular branch of it, that Bryson published no separate work: to do this, he must have been exclusively or especially a geologist, or a mineralogist, or a zoologist, instead of being all the three combined. Over these departments of science, however, his pen ranged in the form of almost thirty papers, which were published in the *Transactions* of the various societies with which he was connected. In 1862 he made a trip to Iceland, and published a short description of his journey, in which he conclusively settled the important fact, that the temperature half-way down the tube of the Great Geyser was 270° Fahr., whilst at the very bottom it was not more than 240° Fahr. In 1864 he read to the Scottish Society of Arts an account of a new method of detecting the presence and position of icebergs at sea, which was reckoned of so much importance, that the Hepburn prize was awarded to it. In the

meantime, his fellow-citizens were not insensible to his distinguished merits, and he was in 1861 elected a member of the Town Council for Newington Ward, an office which he was obliged to resign in November, 1865, on account of failing health, but during that interval he took an active part in introducing the telegraphic communications between the various police stations in the city. In 1865 the city council evinced their sense of his scientific acquirements by appointing him one of the curators for the election of professors for the university of Edinburgh, the chairs of which are subject to their appointment. In the spring of the following year, while engaged in experiments to test the applicability of the electric light in the capture of fish, for which he had obtained a patent, he contracted a severe cold, which was speedily followed by an attack of jaundice, under which he lingered through the summer and autumn, and gradually became weaker, when bronchitis supervened, under which he gradually sank. He died at Hawkhill, Edinburgh, on the 7th of December, 1866. At the next meeting of the Society of Arts, the event was thus announced by the president:—"Before commencing the business of this evening, it is my melancholy duty to refer to the loss which this society, in common with many others in Edinburgh, has sustained from the death of Mr. Alexander Bryson. Mr. Bryson was elected a fellow of this society in 1836, and he was a valuable and valued member of our body. He was also elected president some years ago. His death has been so sudden and so recent, it is not my intention to refer to or enumerate at any length, or indeed at all, the various improvements and the various acquisitions he has made in scientific pursuits; and among so many of his friends—and I see friends here with some of whom he was very familiar—it is quite unnecessary to refer to his kind heart, his frank and genial manner, and the keenness with which he entered into all the scientific pursuits which he took an interest in. The death of Mr. Alexander Bryson makes a sad blank in this scientific society. I have, therefore, to move that some record of the respect we have for his memory should be registered in our minutes, and that our extract should be sent to his family, in the hope that their affliction may to some extent be lightened by the knowledge that we, as a society, sympathize with them in their great loss."

BUCHAN, EARL OF. See ERSKINE, DAVID S.

BUCHAN, ELSPITH, the leader of a small sect of fanatics now extinct, was the daughter of John Simpson, who kept an inn between Banff and Portsoy. She was born in 1738, and educated in the Scottish Episcopal communion. Having been sent when a girl to Glasgow, in order to enter into service, she married Robert Buchan, a workman in the pottery belonging to her master, with whom she lived for several years, and had several children. Having changed her original profession of faith for that of her husband, who was a Burgher-seceder, her mind seems to have become perplexed with religious fancies, as is too often the case with those who alter their creed. She fell into a habit of interpreting the Scriptures literally, and began to promulgate certain strange doctrines, which she derived in this manner from holy writ. Having now removed to Irvine, she drew over to her own way of thinking, Mr. Hugh Whyte, a Relief clergyman, who consequently abdicated his charge, and became her chief apostle. The sect was joined by persons of a rank of life in which no such susceptibility was to be expected. Mr. Hunter, a writer, and several trading people in good circumstances, were among the converts.

After having indulged their absurd fancies for several years at Irvine, the mass of the people at length rose in April, 1784, and assembled in a threatening and tumultuous manner around Mr. Whyte's house, which had become the tabernacle of the new religion, and of which they broke all the windows. The Buchanians felt this insult so keenly, that they left the town to the number of forty-six persons, and, proceeding through Mauchline, Cumnock, Sanquhar, and Thornhill, did not halt till they arrived at a farmhouse, two miles south from the latter place, and thirteen from Dumfries, where they hired the outhouses for their habitation, in the hope of being permitted, in that lonely scene, to exercise their religion without further molestation. Mrs. Buchan continued to be the great mistress of the ceremonies, and Mr. Whyte to be the chief officiating priest. They possessed considerable property, which all enjoyed alike, and though several men were accompanied by their wives, all the responsibilities of the married state were given up. Some of them wrought gratuitously at their trades, for the benefit of those who employed them; but they professed only to consent to this, that they might have opportunities of bringing over others to their own views. They scrupulously abjured all worldly considerations whatsoever, wishing only to lead a quiet and holy life, till the commencement of the millennium, or the day of judgment, which they believed to be at hand. "Observing," they said, "how the young ravens are fed, and how the lilies grow, we assure ourselves that God will feed and clothe us." Mrs. Buchan, who was said to have given herself out to be the Virgin Mary, at first denied that she was so. Instead of being the mother of Christ, she said, after the flesh, she was his daughter after the spirit. The little republic existed for some time without anything occurring to mar their happiness, except the occasional rudeness of unbelieving neighbours. At length, as hope sickened, worldly feelings appear to have returned upon some of the members; and, notwithstanding all the efforts which Mrs. Buchan could make to keep her flock together, a few returned to Irvine. It would seem that as the faith of her followers declined, she greatly increased the extravagance of her pretensions, and the rigour of her discipline. It is said that when any person was suspected of an intention to leave the society, she ordered him to be locked up, and ducked every day in cold water, so that it required some little address in any one to get out of her clutches. In the year 1786 the following facts were reported by some of the seceding members on their return to the west:—"The distribution of provisions she kept in her own hand, and took special care that they should not pamper their bodies with too much food, and every one behaved to be entirely directed by her. The society being once scarce of money, she told them she had a revelation, informing her they should have a supply of cash from heaven: accordingly, she took one of the members out with her, and caused him to hold two corners of a sheet, while she held the other two. Having continued for a considerable time without any shower of money falling upon it, the man at last tired, and left Mrs. Buchan to hold the sheet herself. Mrs. Buchan, in a short time after, came in with five pounds sterling, and upbraided the man for his unbelief, which she said was the only cause that prevented it from coming sooner. Many of the members, however, easily accounted for this pretended miracle, and shrewdly suspected that the money came from her own hoard. That she had a considerable purse was not to be doubted, for she fell on many ways to rob the members of everything

they had of value. Among other things, she informed them one evening, that they were all to ascend to heaven next morning; therefore it was only necessary they should lay aside all their vanities and ornaments, ordering them, at the same time, to throw their rings, watches, &c., into the ash-hole, which many were foolish enough to do, while others more prudently hid everything of this kind that belonged to them. Next morning she took out all the people for their promised flight. After they had waited till they were tired, none found themselves any lighter than they were the day before, but remained with as firm a footing on earth as ever. She again blamed their unbelief—said that want of faith alone prevented their ascension, and complained of the hardship she was under, in being obliged, on account of their unbelief, to continue with them in this world. She at last fell upon an expedient to make them light enough to ascend: nothing less was found requisite than to fast for forty days and forty nights. The experiment was immediately put in practice, and several found themselves at death's door in a very short time. She was then obliged to allow them some spirits and water; but many resolved no longer to submit to such regimen, and went off altogether. We know not," thus concludes the statement, "if the forty days be ended; but a few experiments of this kind will leave her in the end sole proprietor of the society's funds."

What adds to the curiosity of this strange tale of fanaticism, is, that Mrs. Buchan's husband was still living in pursuit of his ordinary trade, and a faithful adherent of the Burgher-seceders. One of her children, a boy of twelve or fourteen, lived with the father; two girls of more advanced age were among her own followers. Notwithstanding her increased absurdity, and, we may add, the increased tyranny of her behaviour, she continued to have a few followers in 1791, when she approached her last scene. Among these was her first apostle, Mr. Whyte. Finding that she was about to go the way of all the earth, she called her disciples together, and exhorted them to continue steadfast and unanimous in their adherence to the doctrine which they had received from her. She told them she had one secret to communicate—a last desperate effort at imposition—that she was in reality the Virgin Mary, and mother of our Lord; that she was the same woman mentioned in the Revelations as being clothed with the sun, and who was driven into the wilderness; that she had been wandering in the world ever since our Saviour's days, and only for some time past had sojourned in Scotland: that though she might appear to die, they needed not be discouraged, for she would only sleep a little, and in a short time would visit them again, and conduct them to the New Jerusalem. After her death, which took place, May, 1791, it was a long time before her votaries would straighten or dress the corpse; nor would they coffin her, until obliged by the smell; and after that they would not bury her, but built up the coffin in a corner of the barn, always expecting that she would rise again from the dead, according to her promise. At last the neighbouring country people, shocked with these proceedings, went to a justice of peace, and got an order that she should be buried; so that the famous Mrs. Buchan was at length reduced to a level with all the dead generations of her kind.

BUCHAN, WILLIAM, M.D., a popular medical writer of great celebrity, was born in 1729, at Ancrum in Roxburghshire. His grandfather had been obliged for some time to reside with his family in Holland, on account of the religious troubles

which preceded the Revolution. His father possessed a small estate, in addition to which he rented a farm from the Duke of Roxburgh. His genius for medicine was displayed before he could have received any adequate instruction; and even when a school-boy, he was at once the physician and surgeon of the village. Nevertheless, being destined by his friends for the church, he repaired to Edinburgh, to study divinity. At the university he spent the unusual time of nine years, studying anything rather than theology. At this period of his life mathematics and botany were among his favourite pursuits. Finally, he devoted himself wholly to medicine. He enjoyed at this time the friendship of the illustrious Gregory, whose liberal maxims are believed to have had great influence over his future life. Before taking his degree, he was induced, by the invitation of a fellow-student, to settle in practice for some time in Yorkshire. While established in that district, he became a candidate for the situation of physician to the Foundling Hospital, then supported by parliament at Ackworth, and, after a fair trial of skill with ten professional men, was successful. In this situation he laid the foundation of that knowledge of the diseases of children which afterwards appeared so conspicuous in his writings. Having returned to Edinburgh to take out his degree, he became acquainted with a well-connected lady of the name of Peter, whom he soon after married. He continued to be physician to the Ackworth Foundling Hospital, till parliament, becoming convinced of the bad effects of such an institution, withdrew the annual grant of £60,000, upon which it had hitherto been supported. He then removed to Sheffield, where for some time he enjoyed extensive practice. He appears to have spent the years between 1762 and 1766 in this town. He then commenced practice at Edinburgh, and for several years was very well employed, though it was allowed that he might have enjoyed much more business, if his convivial habits had not distracted so much of his attention. He was not, however, anxious for an extensive practice. Having for a considerable time directed his attention to a digest of popular medical knowledge, he published, in 1769, his work entitled "*Domestic Medicine; or, the Family Physician*—being an attempt to render the medical art more generally useful, by showing people what is in their own power, both with respect to the prevention and cure of diseases: chiefly calculated to recommend a proper attention to regimen and simple medicines." This work, which had been much indebted, in respect of its composition, to the ingenious William Smellie, was published by Balfour, an eminent bookseller at Edinburgh, at the price of six shillings; and such was its success, that "the first edition," says the author, "of 5000 copies, was entirely sold off in a corner of Britain, before another could be got ready." The second edition appeared in 1772, "with considerable additions." The *Domestic Medicine* is constructed on a plan similar to that adopted by Tissot in his *Avis au Peuple*. It appealed to the wants and wishes of so large a class of the community, that, considering it to have been the first work of the kind published in Britain, there is no wonder that it should have attained such success. Before the death of the author, in 1805, nineteen large editions had been sold, by which the publishers were supposed to realize annually about £700, being exactly the sum which they are said to have given at first for the copyright. The learned Duplanil of Paris, physician to the Count d'Artois (Charles X.), published an elegant translation in five volumes, with some excellent notes, which rendered the work

so popular on the Continent, that in a short time no language in Christendom, not even the Russian, wanted its translation. It would almost appear that the work met with no undivided applause on the Continent than in Britain. While many English and Scottish physicians conceived that it was as apt to generate as to cure or prevent diseases, by inspiring the minds of readers with hypochondriacal notions, those of other countries entertained no such suspicions. Among the testimonies of approbation which Dr. Buchan received from abroad, was a huge gold medallion, sent by the Empress Catherine of Russia, with a complimentary letter. The work is said to have become more popular in America and the West Indies than in the elder hemisphere. The reputation which the author thus acquired induced him to remove to London, where for many years he enjoyed a lucrative practice, though not so great as it might have been made by a more prudent man. It was his custom to resort daily to the Chapter coffee-house, near St. Paul's, where he partly spent his time in conversation with literary and eminent men, and partly in giving advice to patients, who here resorted to him in great numbers, exactly as if it had been his own house. At one time he delivered lectures on natural philosophy, which he illustrated by an excellent apparatus, the property of his deceased friend, James Ferguson. And in this capacity he is said to have manifested as respectable abilities as in his character of a physician.¹

Dr. Buchan was a man of pleasing exterior, most agreeable manners, and great practical benevolence. He cherished no species of antipathy, except one against apothecaries, whom he believed to be a set of rogues, actuated by no principle except a wish to sell their own drugs, at whatever hazard to their patients. His conversation was much courted on account of his lively spirits, and a fund of anecdote which seemed to be perfectly exhaustless. He enjoyed a good constitution, which did not give way till the 25th of February, 1805, when he died in a moment, at his own house, while walking between his sofa and his bed. The disorder was water in the chest, which had been advancing upon him for some time, but was, up to the last moment, so little alarming, that immediately before rising from the sofa he had been talking in his usual manner. The doctor left a son and daughter—the former a man of respectable gifts, and a fellow of the London Royal College of Physicians. His remains were interred in the cloisters of Westminster Abbey, next to those of the celebrated Jebb.

BUCHANAN, DUGALD, a Highland poet of eminent merit, was born in the early part of the eighteenth century, in the parish of Balquhidder, Perthshire. In early youth he is said to have been of a dissolute character; but little is known of him till he was found keeping a small school in a hamlet of his native country, and in possession of much local fame as a writer of devotional and pious verses. Some respectable persons, struck by his talents, interested themselves in his fate, and obtained for him the superior situation of schoolmaster and catechist at Rannoch, on the establishment of the Society for Propagating Christian Knowledge. When he first went to reside in that remote district, the people were so rude, from the want of religious instruction,

that they hardly recognized the sacred nature of the Sabbath. They were in the habit of meeting at different places on that day to amuse themselves with foot-ball and other sports. The parish clergyman visited them once every three weeks; but, from the extent of the parish, he seems to have been unable to exercise any proper control over them. Buchanan, it is said, invited them all to come and enjoy their Sunday recreations with him, and when they arrived, began to perform divine worship, which he seasoned with a lecture on the sin of Sabbath-breaking. Though many were disgusted at first, all of them became at length convinced of their error, and Buchanan in time brought them into a state of high religious culture, the effects of which are said to be visible at this day in Rannoch. The education of this poor scholar was not of the best order; yet he was acquainted with divinity, natural philosophy, and history, and possessed a most felicitous gift of poetry, which he almost exclusively employed for sacred purposes. His writings, which are unknown to English readers, and never can be adequately translated, resemble those of Cowper. An effort was made to obtain for him a license as a preacher of the Scottish church, but without success. He was of much service to the Rev. James Stewart of Killin in translating the New Testament into Gaelic. Having accompanied that gentleman to Edinburgh, in order to aid him in superintending the press, he took the opportunity of improving himself by attendance on the classes for natural philosophy and anatomy in the college. He was at the same time introduced to David Hume, who maintained, in conversation with him, that although the Bible was an excellent book, it was surpassed in beauty and sublimity of language by many profane authors. In support of his assertion, he quoted the lines—

"The cloud-capt towers, the gorgeous palaces,
The solemn temples, the great globe itself,
Yea, all which it inherit, shall dissolve,
And, like the baseless fabric of a vision,
Leave not a wreck behind."

The devout bard admitted the beauty and sublimity of these lines, but said that he could furnish a passage from the New Testament still more sublime, and recited the following verses: "And I saw a great white throne, and him that sat on it, from whose face the earth and the heaven fled away; and there was found no place for them. And I saw the dead, small and great, stand before God; and the books were opened: and another book was opened, which was the book of life. And the sea gave up the dead which were in it; and death and hell delivered up the dead which were in them: and they were judged every man according to their works" (Re. xx. 11-13). Buchanan was very tender-hearted, inasmuch that, when he heard a pathetic tale recounted, he could not abstain from weeping. He was equally subject to shed tears when his bosom was excited with joy, gratitude, and admiration. In his conversation he was modest, mild, and unassuming, and distinguished by great affability—always the best and truest marks of a man of poetical genius. His poems and hymns, which have been repeatedly printed, are allowed to be equal to any in the Gaelic language for style, matter, and harmony of versification. The pieces entitled *La a' Bhreithanais*, and *An Claiogann*, are the most celebrated, and are read with perfect enthusiasm by all Highlanders. Though the circumstances of this ingenious poet were of the humblest description, he was most religiously cheerful and contented under his lot. He died on the 2d of July, 1768, under very painful circumstances. On returning home from a long journey he found two of his

¹ Two other works were published by the doctor:—1. *A Treatise on Gonorrhoea*; 2. *An Advice to Mothers on the Subject of their own Health, and on the means of Promoting the Health, Strength, and Beauty of their Offspring*. Each in one volume, 8vo.

children lying sick of a fever. Shortly after six more of them were seized by it, together with himself and two of his servants. While his family lay in this sad condition, his wife could prevail upon no one to engage in her service, and being herself in a peculiarly delicate condition, she was unable to do much for their comfort. The poor poet soon became delirious, and, in a few days, he and all his family were swept off, leaving only his wife to lament his fate and her own melancholy condition.¹

BUCHANAN, CLAUDIUS, D.D. Few persons have engaged with greater zeal, or met with greater success, in the business of the civilization of India, in spreading the knowledge of the Christian religion through the eastern world, and in making Europeans better acquainted with that interesting country, than the Rev. Dr. Buchanan, who was born at Cambuslang, on the 12th March, 1766. His father, Alexander Buchanan, followed the honourable profession of a schoolmaster; and if we may judge from his success in life, he appears to have been a man of some abilities, and better qualified than ordinary teachers for the discharge of the peculiar duties of his office. Before his death he was rector of the grammar-school of Falkirk. His mother's name was — Somers, daughter of Mr. Claudius Somers, who was an elder in the parish of Cambuslang. He is represented as having been one of those who received their first impressions of religion under the ministry of the Rev. Mr. M'Culloch, the parish minister, and which were confirmed afterwards by the celebrated Mr. George Whitfield. A certain class of Scottish dissenters publicly declared that all such impressions were a delusion of the devil, and in the most abusive language reviled Whitfield and all who defended his cause. But be this as it may, Mr. Somers and a good many others became reformed characters; and during the course of a long life gave undeniable evidence that they were better moral men and better members of society.

In 1773 Dr. Buchanan was sent to Inverary, in the shire of Argyle, where he remained under the care of his father's relations till 1779. He was early sent to school; and besides being taught to read English, to write, and cast accounts, he was initiated into a knowledge of Latin. When only fourteen years of age he was engaged to be tutor to the two sons of Campbell of Dunstaffnage. It is by no means an uncommon case in Scotland for young men to be employed, at that tender age, as domestic tutors in remote parts of the country, and at a distance from any school. He continued in this situation for two years, and then repaired to the university of Glasgow in 1782. Here his funds permitted him to remain only for two sessions. In 1784 he went to the island of Islay, and was tutor in the family of Mr. Campbell of Knockmelly. In the following year he removed to Carradell, in Kintyre, as tutor to Mr. Campbell of Carradell. In 1786 he returned to Glasgow College, with the intention of prosecuting his studies there, preparatory to his commencing the study of divinity; for it had always been his intention to be a clergyman of the Church of Scotland. At the end of the session, however, he was struck with the strange and romantic idea of making a tour of Europe on foot. He seems to have been highly delighted with Dr. Goldsmith's poetry, and particularly with his *Traveller*. Having perused some accounts of Goldsmith's adventures, he became inspired with

a wish to attempt something of the same kind. He could not, like the poet of Auburn, play on the flute, but he was a tolerable performer on the fiddle, and he foolishly imagined that, with its assistance, he might be able to accomplish what he had so much at heart.

He accordingly left Edinburgh in the month of August, 1787. He had carefully concealed his design from his parents, lest it should be the occasion of giving them pain, for he seems to have been well aware in what light his imprudence would be viewed by others. What road he took, or how long he was on his journey between Edinburgh and Newcastle, is not known. But he arrived there, as it would seem, sufficiently disgusted with his undertaking; for, instead of directing his course to the capital by land, he embarked in a *collier* at North Shields, and sailed for the metropolis, where he arrived on the 2d of September. Here he was as much, if not more, at a loss, than ever. At last, seeing an advertisement in a paper, that a clerk was wanted, after having suffered incredibly from hunger and cold, he applied and obtained this paltry appointment. By habits of industry, and attention to business, he recommended himself to his employer, and after various incidents he at last engaged in the service of a solicitor, with whom he remained for nearly three years. This employment, though exceedingly trifling, was sufficient to supply him with food and clothes. He describes himself, at this period, as having little or no sense of religion upon his mind. He did not attend church regularly; and the Sunday was generally spent in idleness, though at no time of his life was he given to habits of dissipation. About this time he got acquainted with the Rev. John Newton of St. Mary's Woolnoth, London, the friend of Cowper, who introduced him to the celebrated Henry Thornton. This latter person, whose heart and fortune were alike bounteous, was the chief occasion of his being afterwards so successful and distinguished in life. As Mr. Buchanan had now formed the resolution of becoming a clergyman, though he could not regularly enter the Church of England, for want of a university education, Mr. Thornton offered him the chaplaincy of the Sierra Leone Company, in which association he bore a leading part. The appointment was accepted by Mr. Buchanan, but, for some unknown reason, was not acted upon. Mr. Thornton, however, generously resolved not to leave his ward destitute or unprovided. He sent him to Queen's College, Cambridge, which was then conducted by his friend Dr. Milner, Dean of Carlisle. Mr. Buchanan was admitted into this society in 1791, and in the twenty-fifth year of his age. It has been mentioned that he was two sessions at the university of Glasgow, but it may be doubted whether this was of essential service to him, so different are the regulations, customs, and habits of the two establishments. He was disposed to enter as a *stipendiar*, that is, a scholar of the lowest rank, the same as *servitor* at Oxford; but it was arranged that he should be admitted as a pensioner, or a scholar who pays for his commons. He distinguished himself at college by great assiduity, and though his mind does not appear to have had any particular bent to the science of quantity, he devoted some attention to the favourite pursuit of the university, the higher branches of mathematics. Having got a theme or subject to write upon in Latin, he succeeded so well as to gain the most marked commendation of his superiors; and he was appointed to declaim in Latin upon the 5th of November, which is always esteemed by the students as a singular honour—this day being one of the most solemn festivals of the year. He was also

¹ For the greater part of the information contained in this article I am indebted to *Bibliotheca Scoto-Celtica, an Account of all the Books which have been printed in the Gaelic Language*. By John Reid. Glasgow, 1832.

appointed, about the same time, librarian to the college, an office of which the duties were more honourable than severe; and he was the senior wrangler of his year.

His education being now complete, he was, in September, 1795, regularly ordained deacon of the Church of England by Bishop Porteous. He was immediately admitted curate to Mr. Newton, which was his first appointment. On the 30th March, 1796, he was appointed chaplain to the East India Company, through the interest of the director, Mr. Charles Grant, who continued to patronize him through life. Dr. Milner and others now recommended him a second time to the Bishop of London, from whom he received priest's orders, so that he was qualified to accept of any situation in the English establishment. In the month of May he went to Scotland, in order to take leave of his relations before setting out for India. He immediately returned to England, and left Portsmouth for Bengal, 11th August, 1796. Landing at Calcutta, he was soon sent into the interior to Barrackpore, where he resided for some time. India was to him a scene perfectly new: at this period hardly any decency was observed in the outward relations of life. There was no divine service at Barrackpore, and horse-racing was practised on Sunday. Of course it was an excellent field for the exertions of a Christian minister. Mr. Buchanan having been appointed third chaplain to the presidency in Calcutta, by Lord Mornington, preached so much to the satisfaction of his audience, that he received thanks from the governor-general in council. The plan of a collegiate institution had been for some time under the consideration of his lordship. In 1800 it was formally established by a minute in council, and vested in a provost and vice-provost, with three other officers. There were also to be established professorships in the languages spoken in India, in Hindoo and Mahometan laws, in the negotiations and laws enacted at the several presidencies for the civil government of the British territories—in political economy, commercial institutions and interests of the East India Company, and in various branches of literature and science. Some of the learned natives attached to the college were employed in teaching the students, others in making translations, and others in composing original works in the oriental tongues. This institution, which has been of immense service to British India, was called the College of Fort William. Mr. Buchanan was professor of the Greek, Latin, and English classics. The translation of the original Scriptures from the originals into modern languages had always been with him a favourite scheme. To effect a similar purpose, he proposed prizes to be competed for by the universities, and some of the public schools in the United Kingdom. These were afterwards more fully explained in a memoir by him in 1805. A translation of the Bible into the Chinese language was also patronized by him. In the course of the same year he wrote an account of the College of Fort William; and the university of Glasgow conferred upon him the degree of D. D.

In May, 1806, he undertook a journey to the coast of Malabar, and returned to Calcutta in 1807. He paid a second visit to Malabar, and powerfully assisted in procuring a version of the Scriptures into Malayalim. In March, 1808, he undertook a voyage to Europe. Second prizes of £500 each were offered by him to Oxford and Cambridge; and in pursuance of his proposals, sermons were preached at both universities.

In September, 1808, Dr. Buchanan undertook a

journey into Scotland, where he had the gratification of finding his mother in good health. He preached in the episcopal chapel at Glasgow, and mentions that the people came in crowds to hear him, "notwithstanding the organ." He observed a more tolerant spirit among the different orders of religion in Scotland than what formerly prevailed. On his return he preached, at Bristol, his celebrated sermon, "The Star in the East," which was the first of that series of able and well-directed efforts by which, in pursuance of a resolution formed in India, he endeavoured to cherish and extend the interest he had already excited for the promotion of Christianity in the East. In spring, 1809, he spent some days at Oxford, collating oriental versions of the Bible. He next paid a visit to Cambridge, where he deposited some valuable Biblical manuscripts, which he had collected in India. The university honoured him with the degree of D. D. About this period he preached regularly for some time in Wilbeck Chapel, London, after which he retired to Kirby Hall, in Yorkshire, the seat of his father-in-law, Henry Thompson, Esq. His health now began to decline, and as he was advised by his physicians to study less unremittingly, he formed the idea of uniting the recovery of his health, and some share of continued usefulness, by travelling to the Holy Land, and endeavouring to re-establish the gospel on its native ground. This design, however, he never executed. Various paralytic affections, which, one after another, fell upon his frame, admonished him that his day of active exertion was past. He was nevertheless able, within the course of a few years, to publish the following works: 1, *Three Jubilee Sermons*; 2, *Annual Missionary Sermon, before the Church Missionary Society, June 12, 1810*; 3, *Commencement Sermons at Cambridge*; 4, *Christian Researches in Asia*; 5, *Sketch of an Ecclesiastical Establishment for British India*; 6, *Colonial Ecclesiastical Establishment*.

He had been twice married, but survived both of his spouses. He ultimately went to reside at Cheshunt in Hertfordshire, to superintend a Syrian edition of the New Testament. Here he died, February 9, 1815, while his task was still incomplete, at the early age of forty-eight. The exertions of this amiable and exemplary man in propagating the Christian religion in India, will long keep his name in grateful remembrance, among all to whom the interests of religion are in the least endeared.

BUCHANAN, FRANCIS, M. D., author of *Travels in the Mysore, A History of Nepal, &c.*, was born at Branziet, in Stirlingshire, February 15th, 1762. He was the third son of Dr. Thomas Buchanan of Spital, who afterwards succeeded as heir of entail to the estate of Leney in Perthshire; and Elizabeth Hamilton, heiress of Bardowie, near Glasgow. As a younger brother he was, of course, destined to a profession. He chose that of his father; and after finishing the elementary parts of his classical education with considerable credit, at the grammar-school of Glasgow, he commenced his medical studies at the university, where he remained till he had received his diploma. Glasgow College has always enjoyed a high reputation for literature and ethics; but, with the exception, perhaps, of the department of anatomy, its fame as a medical school has never equalled that of Edinburgh. During the latter part of the eighteenth century especially, the capital enjoyed a reputation for medical science scarcely inferior to that of any medical school in Europe. Buchanan was anxious to secure for himself the advantage of pursuing his professional studies under the eminent

professors who, at that time, more than sustained the high reputation which Edinburgh College had already acquired. Here he remained till he received his degree in 1783. He soon after was appointed assistant-surgeon on board a man-of-war, a situation from which he was afterwards obliged to retire on account of ill-health. He now spent some years at home, in the country, his health being so bad as to disqualify him for all active exertion, till 1794, when he received an appointment as surgeon in the East India Company's service, on the Bengal establishment. The voyage to India completely restored his health, and on his arrival he was sent with Captain Symes on his mission to the court of Ava. In the course of his medical studies, Dr. Buchanan had paid particular attention to botany, and its cognate branches of natural science; and during his present visit to the Birman Empire, he had an opportunity of making some valuable collections of the plants of Pegu, Ava, and the Andaman Islands, which, together with several interesting drawings, he transmitted to the court of directors, by whom they were presented to Sir Joseph Banks. On his return from Ava, he was stationed at Luckpoo, near the mouth of the Burrampooter, where he remained two years, principally occupied in describing the fishes found in the neighbourhood.

In 1798 he was employed by the Board of Trade at Calcutta, on the recommendation of Dr. Roxburgh, superintendent of the botanical garden, to visit the district of Chatigang and its neighbourhood, forming the chief part of the ancient kingdom of Tripura. The extensive and well-watered districts of India beyond the Ganges afforded him a wide and rich field for pursuing his favourite study. The numerous specimens which he collected in this interesting country were also transmitted to Sir Joseph Banks, and added to his collection. Part of the following year Dr. Buchanan spent in describing the fishes of the Ganges, of which he afterwards published an account.

In 1800 he was employed by Marquis Wellesley, then Governor-general of India, to examine the state of the country which the Company's forces had lately conquered from Tippoo Sultan, together with the province of Malabar. The results of his inquiries in the Carnatic and Mysore he afterwards, on his return to England, in 1807, published under the patronage of the court of directors. This work, *Travels in the Mysore, &c.*, extending to three large quarto volumes, illustrated with maps and drawings, contains much valuable information concerning the agriculture, laws, customs, religious sects, history, &c., of India generally, and particularly of the interior dependencies of Madras. In criticizing the work the *Edinburgh Review* observes, "Those who will take the trouble to peruse Dr. Buchanan's book, will certainly obtain a far more accurate and correct notion of the actual condition and appearance of India, and of its existing arts, usages, and manners, than could be derived from all the other books relating to it in existence." The reviewer adds still more valuable praise—a praise not always deserved by travellers in countries comparatively little known—when he acknowledges that "everything the author has seen is described perspicuously, unaffectedly, and, beyond all question, with the strictest veracity." *Edinburgh Review*, vol. xiii. Oct. 1808.

Soon after Dr. Buchanan had finished his survey of the Mysore country, he changed the scene of his labours from the south to the north-east of Hindoostan, being appointed, in 1802, to accompany the embassy to Nepal, conducted by Captain Knox. In the course of this journey, and his subsequent resid-

ence in Nepal, he made large additions to his former collections of rare plants; which, with descriptions and numerous drawings, he transmitted to Mr. J. E. Smith. It was during this period also that he collected the greater part of the materials for his *History of Nepal*, which he published in 1818, some years after he had retired from the Company's service. On his return from Nepal he was appointed surgeon to the governor-general, and he employed such leisure time as he had for the study of natural history, in superintending the menagerie founded by the Marquis Wellesley, and in describing the animals which it contained. In 1805 Dr. Buchanan accompanied his noble patron to England; and, in the following year, was again sent to India by the court of directors for the purpose of making a statistical survey of the territory under the presidency of Fort William, which comprehends Bengal proper and several of the adjoining districts. With this laborious undertaking he was occupied for upwards of seven years, after which he returned to Calcutta; and, on the death of Dr. Roxburgh in 1814, succeeded him as superintendent of the botanical garden, having been appointed successor to that respectable botanist by the court of directors so early as 1807. But he was now exhausted with long-continued exertion: his services had been liberally rewarded by the East India Company; and he naturally wished to enjoy the close of a busy life, free from the responsibility and inquietudes of public service, in some peaceful retirement in his native land. While he was preparing for his voyage home he was deprived, by the Marquis of Hastings, of all the botanical drawings which had been made under his inspection during his last stay in India, and which he intended to have deposited with his other collections in the library of the India House. This circumstance he greatly regretted, as he feared that the drawings would thus be totally lost to the public. "To me," says Dr. Buchanan, in a paper which was published among the *Transactions* of the Royal Society of Edinburgh, "to me, as an individual, they were of no value, as I preserve no collection, and as I have no occasion to convert them into money."

On his arrival in England in 1815, he presented to the court of directors his collection of plants and minerals, some papers on the geography of Ava, several genealogical tables, nine hundred Indian coins, gold and silver, a collection of Indian drugs, his notes on natural history, a few drawings, and about twenty curious Hindoo MSS. He then proceeded to Scotland, where he hoped to enjoy the fruits of his toil in quiet. On his arrival he found his elder brother, Colonel Hamilton, involved in pecuniary difficulties, from which he could only be partially relieved by the sale of such parts of the family estates as had not been entailed. Dr. Buchanan, who was himself next heir, Colonel Hamilton having no children, agreed to pay his brother's debts, which amounted altogether to upwards of £15,000. His brother soon after died abroad, whither he had gone in the hope of recovering his health, and Dr. Buchanan, succeeding him in his estates, adopted his mother's family name of Hamilton. He now fixed his residence at Leney, where he amused himself with adding to the natural beauties of one of the loveliest spots in Perthshire, such improvements as a cultivated taste and an ample fortune enabled him to supply. In this sweet retirement he still found pleasure in prosecuting the studies and scientific pursuits which had engrossed the busier part of his life. His garden occupied much of his attention; he introduced into his grounds many curious plants, shrubs, and flowers; he con-

tributed largely to the scientific journals of the day, particularly the *Edinburgh Philosophical Journal*, the *Edinburgh Journal of Science*, the *Transactions of the Linnean Society of London*, the *Memoirs of the Hibernian Natural History Society*, and the *Transactions of the Royal Society of Edinburgh*. Also in the *Transactions of the Royal Asiatic Society* are several papers taken from his statistical survey of the provinces under the presidency of Fort William, deposited in the library of the East India Company: these papers, at the instance of Dr. Buchanan, were liberally communicated to the society, accompanied with explanations by Henry Thomas Colebrooke, Esq., one of the directors. In 1819 he published his *History of the Kingdom of Nepal*, already mentioned; and in the same year a *Genealogy of the Hindoo Gods*, which he had drawn up some years before with the assistance of an intelligent Brahmin. In 1822 appeared his *Account of the Fishes of the Ganges*, with plates.

Dr Buchanan was connected with several distinguished literary and scientific societies. He was a member of the Asiatic Society of Calcutta—a fellow of the Royal Society, the Linnean Society, and Society of Antiquaries of London—an ordinary member of the Society of Scottish Antiquaries—a fellow of the Royal Society of Edinburgh—a member of the Royal Asiatic Society of Great Britain and Ireland, &c. &c. In 1826 he was appointed a deputy-lieutenant for Perthshire, and took a warm interest in the politics of the day. His own principles were Tory, and he was not a little apt to be violent and overbearing in discussion with men of the opposite party. But although hasty in his temper and violent in his politics, Dr. Buchanan was of a generous and liberal disposition; he was extremely charitable to the poor, warm in his personal attachments, and just and honourable in his public capacity of magistrate. He married late in life, and fondness for the society of his children, joined with studious habits, left him little leisure or inclination for mixing in the gayeties of the fashionable world. He lived, however, on terms of good understanding and easy intercourse with his neighbours. His own high attainments and extensive information eminently qualified him for enjoying the conversation and appearing to advantage in the society of men of liberal education; and to such his house was always open. His intimate acquaintance with oriental manners, geography, and history, made his conversation interesting and instructive; his unobtrusive manners, his sober habits, his unostentatious and unaffected hospitality, made him an agreeable companion and a good neighbour; while the warmth and steadiness of his attachments rendered his friendship valuable. The following high estimate of his character we find in Dr. Robertson's statistical account of the parish of Callander, so early as the year 1793: "The most learned person who is known to have belonged to this parish is Dr. Francis Buchanan, at present in the East Indies. In classical and medical knowledge he has few equals, and he is well acquainted with the whole system of nature." Dr. Buchanan carried on an extensive correspondence with men of eminence in the literary and scientific world; he repeatedly received the public thanks of the court of directors, and of the governor-general in council, for his useful collections and his information on Indian affairs; and when his former patron, Marquis Wellesley, went as lord-lieutenant to Ireland he was solicited to accompany him in an official capacity—an offer which his declining health and love of domestic quiet induced him to decline. Dr. Buchanan died June 15, 1829, aged 67.

BUCHANAN, GEORGE, one of the most distinguished reformers, political and religious, of the sixteenth century, and the best Latin poet which modern Europe has produced, was born in the parish of Killearn, Stirlingshire, in February, 1506, "of a family," to use his own words, "more ancient than wealthy." His father, Thomas, was the second son of Thomas Buchanan of Drumikill, from whom he inherited the farm of Moss, on the western bank of the water of Elane, the house where, though it has been several times rebuilt, still, in honour of the subject of this memoir, preserves its original shape and dimensions, with a considerable portion of its original materials. His mother was Agnes Heriot, of the family of Tabroun in East Lothian. The Buchanans of Drumikill were highly respectable, being a branch of the family of Buchanan of Buchanan, which place they held by charter as far back as the reign of Malcolm III. Antiquity of descent, however, is no preservative against poverty, of which our poet's family had their full share, for the bankruptcy of his grandfather, the laird of Drumikill, and the death of his father while in the flower of his age, left George Buchanan, when yet a child, with four brothers and three sisters, with no provision for their future subsistence but their mother's industry. She appears, however, to have been a woman of excellent qualities; and by the prudent management of the farm, which she retained in her own hands, brought up her family in a respectable manner, and had the satisfaction of seeing them all comfortably settled. George, the third son, received the rudiments of his education in the school of his native village, which was at that time one of the most celebrated in Scotland; and having at an early period given indications of genius, his maternal uncle, James Heriot, was induced to undertake the care and expense of his education; and, in order to give him every possible advantage, sent him in 1520, when fifteen years of age, to prosecute his studies in the university of Paris. Here he studied with the greatest diligence, and impelled, as he has himself told us, partly by his inclination, and partly by the necessity of performing the exercises of his class, put forth the first blossom of a poetical genius that was afterwards to bear the rich fruits of immortality. Scarcely, however, had his bright morning dawned when it became suddenly overcast. Before he had completed his second year, his uncle died, leaving him in a foreign land, exposed to all the miseries of poverty, aggravated by bodily infirmity, occasioned most probably by the severity of his studies; for, at the same time that he was in public competing with the best students of the several nations of Europe, who, as to a common fountain, were assembled at this far-famed centre of learning, he was teaching himself Greek, in which he was latterly a great proficient. He was now obliged to return home, and for upwards of a twelvemonth was incapable of applying to any business. In 1523 he joined the auxiliaries brought over from France by Albany, then regent of Scotland; and served as a private soldier in one campaign against the English. He tells us that he took this step from a desire to learn the art of war; but perhaps necessity was as strong a prompter as military ardour. Whatever were his motives, he marched with the army commanded by the regent in person, who entered England and laid siege to the castle of Werk, in the end of October, 1523. Repulsed in all his attempts on the place, Albany soon found himself under the necessity of recrossing the Tweed; and being overtaken by a severe snow-storm in a night-march toward Lauder, lost a great part of his army; Buchanan escaped, but was confined the rest

CHARLES D. LEE

REVEREND FATHER

OF THE UNIVERSITY OF MICHIGAN

of the winter to his bed. In the ensuing spring, being considerably recovered, and having completed his eighteenth year, he was sent to the university of St. Andrews, to attend the prelections of John Mair, or Major, who at that time, according to his celebrated pupil, "taught logic, or, more properly, the art of sophistry," in St. Salvador's College. Buchanan's eldest brother, Patrick, was matriculated at the same time. Having continued one session at St. Andrews, where he took the degree of Bachelor of Arts, on the 3d of October, 1525, being then, as appears from the college registers, a pauper or exhibitioner, he accompanied Major to France the following summer. Mackenzie says that, on account of his great merits and at the same time his great poverty, Major sent for him, in 1524, and took him into his house as a servant, in which capacity it was that Buchanan went with him to Paris, and remained with him two years; but this has been regarded by the vindicators of Buchanan as a story set forth for the purpose of fixing a charge of ingratitude upon the poet, for an epigram which he wrote upon one of Major's productions, and in which his old instructor is termed "solo cognomine major."

On returning to France, Buchanan became a student in the Scots college of Paris, and in March was incorporated a Bachelor of Arts—the degree of Master of Arts he received in April, 1528. In June the following year he was elected procurator for the German nation, one of the four classes into which the students were divided, and which included those from Scotland. The principles of the Reformation were by this time widely extended on the Continent, and everywhere excited the most eager discussion. Upon Buchanan's ardent and generous mind they made a powerful impression, and it was not in his nature to conceal it. Yet he seems to have acted with considerable caution, and was in no haste to renounce the established forms of worship, whence we conclude that the reported mortifications he is said to have met with at this time and on that account are without foundation. At the end of two years he was elected a professor in the college of St. Barbe, where he taught grammar three years; and, by his own account, his remuneration was such as to render his circumstances at least comparatively comfortable. It appears to have been in 1529 that this office was conferred upon him; he was consequently only in his twenty-third year. Soon after entering on his professorship, Buchanan attracted the notice of Gilbert Kennedy, Earl of Cassillis, then residing in Paris, whither he had been sent to prosecute his studies, as the Scottish nobility at that period generally were; and at the end of three years Buchanan was engaged to devote his time entirely to the care of the young earl's education. With this nobleman he resided as a preceptor for five years; and to him, as "a youth of promising talents and excellent disposition," he inscribed his first published work, a translation of Linacre's rudiments of Latin grammar, which was printed by the learned Robert Stephens, in 1533.

In 1536 James V. made a matrimonial excursion to France, where he found the Earl of Cassillis, who had just finished his education. James having, on the 1st of January, 1537, married Magdalene, daughter of Francis I., returned to Scotland in May, bringing with him Cassillis and George Buchanan. This accounts for the future intimacy between the latter person and the king, which in the end was like to have had a tragical termination. The connection between Buchanan and the earl seems, however, not to have been immediately dissolved; for it was while residing at the house of his pupil, that

the poet composed *Somnium* or *the Dream*, apparently an imitation of a poem of Dunbar's, entitled *How Dunbar was desyred to be ane Frier*, and a bitter satire upon the impudence and hypocrisy of the Franciscans. This piece of raillery excited such resentment that Buchanan had determined to retire to Paris, where he hoped to be able to resume his former situation in the college of St. Barbe. James V., however, took him under his protection, and retained him as preceptor to his natural son, James Stuart, not the prior of St. Andrews, but one of the same baptismal name who held the abbacies of Melrose and Kelso. James, who about this time was not satisfied with the conduct of the clergy, sent for Buchanan, and not aware that he had already rendered himself obnoxious to the Franciscans, commanded him to write a satire against them. Wishing to gratify the king, and yet give as little additional ground of offence to the friars as possible, Buchanan wrote his *Palinodia* in two parts, a covert satire, which he hoped might afford no ground of open complaint to those against whom it was directed. The king, himself a poet, coarse and licentious, did not at all relish this delicate kind of irony, and it wounded the ecclesiastics still more painfully than its predecessor the *Somnium*. Finding it impossible to propitiate the friars, and the king still insisting upon their vices being fully and fairly exposed, he at last gave full scope to his indignation at the impudence, ignorance, impiety, and sensuality that distinguished the whole order, almost without an individual exception, in his poem entitled *Franciscanus*, one of the most pungent satires to be found in any language. In this composition Buchanan had little occasion to exercise his fancy, facts were so abundant. He had but to embody in flowing language what was passing before all men's eyes, for the clergy, besides being robbers of the poor, lived, the far greater part of them, in the open and avowed practice of the most loathsome debauchery. Still they were the most powerful body in the state; and after the death of Magdalene, who had been bred under her aunt, the Queen of Navarre, a Protestant, and was friendly to the cause, they gained an entire ascendancy over the too facile king, who had not the grace to protect the tutor of his son from the effects of their rage, occasioned by poems that had been written at his own express command. Towards the end of the year 1538, measures were taken for the total suppression of the new opinions, and in February following, five persons were committed to the flames; nine saved their lives by burning their bills, as it was called, or in other words recanting. Among the rest George Buchanan was on this occasion seized, and, to secure ample vengeance upon him, Cardinal Beaton offered the king a sum of money for his life; a piece of supererogatory wickedness for which there was not the smallest occasion, as the prejudices of his judges would infallibly have secured his condemnation, had he been brought before any of their tribunals; but, aware of the mortal enmity of his accusers, he fled into England. By the way he happily escaped a pestilential distemper, which was at that time desolating the north of England, and, when he arrived in London, experienced the protection of an English knight, Sir John Rainsford, who both supplied his immediate necessities, and protected him from the fury of the Papists, to whom he was now everywhere obnoxious. On this occasion it was that he addressed himself to Henry VIII. and to his minister Cromwell, both of whom treated him with neglect. Several of his little pieces written at this time attest the straits to which he was reduced. England at that period had

few attractions for a Scotsman; and it must have been peculiarly galling to the lofty spirit of Buchanan, after stooping to solicit patronage among the natural enemies of his country, to find his efforts despised, and his necessities disregarded.

Meeting with so little encouragement there, he passed over to Paris, where he was well known, and had many acquaintances. But here, to his dismay, he found Cardinal Beaton resident as ambassador from the Scottish court. This circumstance rendered it extremely unsafe for him to remain; happily he was invited to Bordeaux by Andrew Govea, a Portuguese, principal of the college of Guienne, lately founded in that city, through whose interest he was appointed professor of humanity in that afterwards highly-famed seminary. Here Buchanan remained for three years, during which he completed four tragedies, besides composing a number of poems on miscellaneous subjects. He was all this while the object of the unwearied enmity of Cardinal Beaton and the Franciscans, who still threatened his life. The cardinal at one time wrote to the Bishop of Bordeaux, commanding him to secure the person of the heretical poet, which might perhaps have been done; but the letter falling into the hands of one of the poet's friends, was detained till the appearance of a pestilence in Guienne absorbed every lesser concern. The death of James V. following soon after, with the distractions consequent on that event, gave the cardinal more than enough to do at home without taking cognizance of heretics abroad. Among his pupils at Bordeaux, Buchanan numbered the celebrated Michael de Montague, who was an actor in every one of his dramas; and among his friends were not only his fellow-professors, but all the men of literature and science in the city and neighbourhood. One of the most illustrious of these was the elder Scaliger, who resided and practised as a physician at Agin; at his house Buchanan and the other professors used to spend part of their vacations. Here they were hospitably entertained, and in their society Scaliger seems not only to have forgot, as he himself acknowledges, the tortures of the gout; but, what was more extraordinary, his natural talent for contradiction. The many excellent qualities of this eminent scholar, and the grateful recollection of his conversational talents, Buchanan has preserved in an elegant Latin epigram, apparently written at the time when he was about to quit this seat of the muses, to enter upon new scenes of difficulty and danger. The younger Scaliger was but a boy when Buchanan visited at his father's house; but he inherited all his father's admiration of the Scottish poet, whom he declared to be decidedly superior to all the Latin poets of those times. After having resided three years at Bordeaux, and conferred lustre upon its university by the splendour of his talents, Buchanan removed, for reasons which we are not acquainted with, to Paris; and in 1544 we find him one of the regents in the college of Cardinal le Moire, which station he seems to have held till 1547. There he had for his associates, among other highly respectable names, the celebrated Turnebus and Muretus. By a Latin elegy addressed to his late colleagues, Tastœus and Tevius, we learn that about this period he had a severe attack of the gout, and that he had been under the medical care of Carolus Stephanus, who was a doctor of physic of the faculty of Paris, and, like several of his relations, was equally distinguished as a scholar and as a printer. In the same elegy Buchanan commemorates the kindness of his colleagues, particularly of Gelida, an amiable and learned Spaniard, less eminent for talents than Buchanan's other colleagues Turnebus and Muretus,

but as a man of true moral worth and excellence, at least equal to the former and vastly superior to the latter, who, though a man of splendid talents; was worthless in the extreme. To Muretus, Buchanan addressed a copy of verses on a tragedy written by him in his youth, entitled *Julius Cæsar*; but Muretus had not as yet put forth those monstrosities of character, that ought long ago to have buried his name in oblivion.¹

In the year 1547 Buchanan again shifted his place, and, along with his Portuguese friend Andrew Govea, passed into Portugal. Govea, with two brothers, had been sent for his education into France by John III. of Portugal, who, having now founded the university of Coimbra, recalled him to take the principal superintendance of the infant establishment. Aware, at the same time, that his whole kingdom could not furnish a sufficiency of learned men to fill the various chairs, his majesty commissioned Govea to bring a number of learned men with him for that purpose. The persons selected were George Buchanan, his elder brother Patrick, Gruchius, Geruntæus, Tevius, and Vinetus, all of whom had already distinguished themselves by the publication of learned works. Arnoldus Fabricius, John Costa, and Anthony Mendez—the two latter, natives of Portugal—completed the establishment, and all of them, Patrick Buchanan and Fabricius excepted, had under Govea been teachers in the college of Guienne. France at this period threatened to be the scene of great convulsions, and Buchanan regarded this retirement to Portugal as an exceedingly fortunate circumstance; and for a short time his expectations were fully realized. Govea, however, died in less than a twelvemonth, and, deprived of his protection, the poor professors soon found themselves exposed to the jealousy of the natives on account of being foreigners, and to the unrelenting bigotry of the priests because they were scholars. Three of their number were very soon immured in the dungeons of the Inquisition, and, after a tedious confinement, brought before that tribunal, which, unable to convict them of any crime, overwhelmed them with reproaches, and remanded them to their dungeons, without permitting them so much as to know who were their accusers. Buchanan did not escape his share of this persecution. *Franciscanus* was again revived against him, though the inquisitors knew nothing of that poem; for he had never parted with a copy, save that which he gave to his own king, James V., and he had taken care to have the whole affair properly explained to the Portuguese monarch before he set foot in his dominions. He was also charged with eating flesh in Lent, a practice quite common in Portugal at that time, and with having asserted that Augustine's opinion of the eucharist coincided with the Protestant rather than with the Romish views on the subject; and two witnesses were found to declare that he was an enemy to the Roman faith. More merciful than on many other occasions, the Inquisition, after dealing with Buchanan for upwards of a year and a half, sentenced him to be confined in a monastery for some months, that he might by the inmates be better instructed in the principles and practice of religion. Fortunately, the monks to whose care Buchanan was thus consigned were not without humanity, though he found them utterly ignorant of religion; and he consoled

¹ Of Muretus's impious book, *De Tribus Impostoribus*, or the three impostors, Moses, Jesus, and Mahomet, a late biographer of Buchanan has said, "It is extremely evident that such a book never existed." We are informed, however, that a copy exists in the MS. collection of the university of Glasgow.

himself by planning, and in part executing, his unrivalled paraphrase of the Psalms of David, which placed him immeasurably above all modern Latin poets, and will transmit his name with honour and admiration to the latest posterity. That this was a task imposed upon him by his ghostly guardians, is an idle tale totally devoid of foundation. The probability is that the poor monks were incapable of appreciating his labours; but he seems to have gained their good-will, for he was restored to his liberty, and soliciting the king's permission to return to France, was requested to remain, and presented with a small sum of money for subsistence till a situation worthy of his talents should be found.

After having suffered so much from the Inquisition, Buchanan could not be very ambitious of Portuguese preferment, and the promise of the king not being likely to be hastily fulfilled, he embarked in a Greek vessel at Lisbon and sailed for England. To England, however, he certainly had no partiality; and though Edward VI. was now on the throne, and doing all he could to advance the work of reformation, and though some very advantageous offers were made to induce him to settle in that country, he proceeded direct to France, where he arrived in the beginning of 1553. It was at this time that Buchanan wrote his poem *Adventus in Galliam*, in which his contempt and resentment of the Portuguese, and the treatment he had received, together with his affection for the French nation, are strongly expressed. Perhaps it would be too much to say that the French nation was attached to Buchanan; but many individuals of it certainly were, and immediately on his arrival in Paris he was appointed to a regency in the college of Boncourt. In this station he remained till 1555, when he was engaged by the celebrated Comte de Brissac, to act as domestic tutor to his son, Timoleon de Cosse. To this nobleman he had addressed a poetical tribute after the capture of Vercelli, an event which occurred in September, 1553; and to him also he dedicated his tragedy of *Jephthes* in the summer of 1554. The Comte, who seems not to have been insensible to this species of flattery, next year called the poet into Italy, where he himself presided over the French dominions, and charged him with the education of his son. Though much of his time had been spent amidst the tumults of war, the Marshal de Brissac was a man of a liberal mind, who, living in a state of princely magnificence, cultivated an acquaintance with the most eminent scholars. During his campaigns he had often been accompanied by men of learning, and had the discernment to discover in the preceptor of his son powers of mind equal to any station in society. He therefore treated him with the utmost deference, often placing him at the council board among his principal officers, and on the most important occasions thought it no discredit to take the benefit of his superior sagacity. When committed to the tuition of Buchanan, Timoleon de Cosse was only twelve years of age, and he parted with him at the age of seventeen. He was afterwards distinguished for his bravery, for his acquaintance with military science; and his literary attainments were such as reflected honour on a young nobleman destined for the profession of arms. His short but brilliant career terminated at the siege of Mucidan, where he fell by a musket-ball, aged only twenty-six years. During the five years of his connection with this illustrious family, Buchanan's residence was alternately in France and Italy, and as his pupil was destined to the profession of arms, and had different masters to attend him, he found leisure for prosecuting his poetical studies, and

formed the design, and composed part of his philosophical poem *De Sphæra*, which he addressed to his pupil. His future avocations prevented him from completing this poem. He likewise published the first specimen of his version of the Psalms, and his translation of the *Alcestes* of Euripides, which he inscribed to Margaret, daughter of Francis I., a munificent princess, afterwards married to the Duke of Savoy. His ode on the surrender of Calais was also composed while in Brissac's family. But much of his spare time was employed in a manner still more important—in examining the grounds of his religious belief, and settling to his own satisfaction the great question (that has ever since, more or less, agitated Europe) between the Romish and the reformed churches. That he had all along inclined to the side of the reformed is indisputable; but he had never relinquished his connection with the ancient church, which he had probably thought still right in the main, though disfigured and disgraced by the figments and the follies of an ignorant and corrupt priesthood. The result of this examination, however, was a perfect conviction that many of the Romish doctrines were erroneous, that the worship was idolatrous, and the discipline utterly depraved and perverted; and, consequently, that the necessity of separation from this church was imperative upon all who had any regard to the word of God and the salvation of their own souls: and no sooner did he arrive in Scotland than he acted accordingly.

As Buchanan's connection with the Marshal de Brissac terminated in 1560, when the civil wars in France had already begun, he probably returned immediately to Scotland, though the exact period has not been ascertained. He had courted, while he resided in France, the notice of Mary, by an epithalamium on her marriage with the dauphin; and in January, 1561-2, we find Randolph, the English ambassador, writing thus from Edinburgh to his employers: "Ther is with the queene [Mary] one called George Bowhanan a Scottishe man very well learned, that was schollemaster unto Monsr. de Brissack's son, very godlye and honest." And in a subsequent letter, dated from St. Andrews, he says, "The queene readeth daylie after her dinner, instructed by a learned man, Mr. George Bowhanan, somewhat of Livy." Mary had been sent to France in the sixth year of her age, and her education had in some respects been carefully attended to. She spoke Scottish and French, as if both had been her vernacular tongue, which in some degree they might be said to be. With Italian and Spanish she was familiar, and she was so much a master of Latin as to compose and pronounce in that language, before a splendid auditory, a declamation against the opinion of those who would debar the sex from the liberal pursuits of science and literature. This oration she afterwards translated into French, but neither the translation nor the original has been published. Mary was at this time in the full bloom of youth and beauty, and to have such a pupil must have been highly gratifying to Buchanan, who, with all the leaders of the Reformation in Scotland, was at first much attached to her. This attachment he took occasion to express in a highly finished copy of Latin verses, prefixed to his translation of the Psalms, which he had just finished, and sent to the press of his friend Henry Stephens. The exact date of the first full edition of this important work is not known, no date being on the title; but a second edition was printed in 1566, in which was included the author's tragedy of *Jephthes*. On the title-page of both these impressions, Buchanan is styled *Poëtarum nostri sæculi facile princeps*, and the paraphrase was re-

commended by copies of Greek verses by the printer, Henry Stephens, one of the first scholars of the age, by Francisus Portus, and Fredricus Jamotius, and in Latin verses by Henry Stephens and Castlevetro. Mary must have been highly pleased by a compliment which carried her fame over all Europe; and, as a reward for his services, bestowed upon her preceptor and poet, in 1564, the temporalities of the abbey of Crossraguell, vacant by the death of Quintin Kennedy, brother to Buchanan's former pupil the Earl of Cassillis. These temporalities were valued at £500 Scots a year, and the poet seems to have held them till the day of his death. Mary's love of power, and her attachment to Popery, soon, however, alienated the affections of her friends; and, aware that he held her favour by a precarious tenure, Buchanan sedulously cultivated the friendship of the leaders of the Reformation, which was now become the first object of his solicitude. In the same year in which he was promoted to the temporalities of Crossraguell, he prepared for the press a collection of satires, *Fratres Fraterrimi*, in which the foeleries and impurities of the Popish church were treated with the keenest irony, and assailed with the most vehement invective. He also now put the finishing hand to his *Franciscanus*, which he published, with a dedication to his friend and patron the Earl of Murray. Through the interest of this nobleman, Buchanan was nominated to be principal of St. Leonard's College, St. Andrews, in 1566. In November this year his name appears as one of the auditors of the faculty quistor's accounts in the university of St. Andrews, where he had now fixed his residence. The chamber which he occupied, as principal of St. Leonard's, is now part of a private dwelling-house, and is supposed to have undergone scarcely any transformation. The following inventory of its furniture in 1544 has been preserved:—
 "Twa standard beds, the foreside of aik and the northside and the fuits of fir—Item ane feather bed and ane white plaid of four ells and ane covering woven o'er with images—Item another auld bed of harden filled with straw with ane covering of green—Item ane cod—Item ane inrower of buckram of five breeds part green part red to zailow—Item ane hunters counter of the middlin kind—Item ane little buird for the studie—Item ane furn of fir and ane little letterin of aik on the side of the bed with ane image of St. Jerom—Item ane stool of elm with ane other chair of little pine—Item ane chimney weighing . . .—Item ane chandler weighing . . ." In 1566, and the two ensuing years, he was one of the four electors of the rector, and by each of the three officers who were successively chosen was nominated a pro-rector; and in the public register he is denominated by the honourable title which, in publishing his Psalms, Stephanus had bestowed on him. As principal of the college, he delivered occasional prelections on theology, as well as at the weekly meetings of the clergy and other learned men of the district, held for expounding the Scriptures, then styled the exercise of prophesying, and in the general assembly of the Scottish church he sat as a doctor from the year 1563 to 1567, in which last year he had the honour of being chosen moderator. This same year he published another collection, consisting of *Elegiæ Silve Hendecasyllabi*, to which was prefixed an epistle to his friend Peter Daniel, the learned editor of Virgil, with the commentary of Servius, in which he gives several notices respecting his avocations, and especially respecting his poetical works. "Between the occupations of a court, and the annoyance of disease, I have hardly," he remarks, "been able to steal any portion of time which I could

devote to my friends or to myself, and I have therefore been prevented from maintaining a frequent correspondence with them, and from collecting my poems which lie so widely dispersed. For my own part I was not extremely solicitous to recall them from perdition, for the subjects are generally of a trivial nature, and such as at this period of life are at once calculated to inspire me with disgust and shame. But as Pierre Montauré, and some other friends, to whom I neither can nor ought to refuse any request, demanded them with such earnestness, I have employed some of my leisure hours in collecting a portion, and placing it in a state of arrangement. With this specimen, which consists of one book of elegies, another of miscellanies, and a third of hendecasyllables, I in the meantime present you. When it shall suit your convenience, I beg you will communicate them to Montauré, Des Mesmes, and other philological friends, without whose advice I trust you will not adopt any measure relative to their publication. In a short time I propose sending a book of iambics, another of epigrams, another of odes, and perhaps some other pieces of a similar description. All these I wish to be at the disposal of my friends, as I have finally determined to rely more on their judgment than on my own. In my paraphrase of the Psalms, I have corrected many typographical errors, and have likewise made various alterations. I must therefore request you to advise our friend Stephanus not to publish a new edition without my knowledge. Hitherto I have not found leisure to finish the second book of my poem *De Sphæra*, and therefore I have not made a transcript of the first. As soon as the former are completed, I shall transmit them to you. Salute in my name all our friends at Orleans, and such others as it may be convenient. Farewell. Edinburgh, July the twenty-fourth, 1566." The work, of course, met with his friend's approbation, and was printed in Paris by Robert Stephens in 1567, 12mo. We have already noticed that the poem *De Sphæra* was never completed. From the above letter it appears that it was Buchanan's intention to return to it when he should have finished some others that were in a greater state of forwardness, and did not require such a full command of his time as a work of greater magnitude. Circumstances, however, soon put a period to these peaceful and pleasing pursuits.

The marriage of Mary and Darnley, the murders of Rizzio and Darnley, the union between the queen and Bothwell, the flight of the latter, Mary's surrender to the confederated lords, her imprisonment in Lochleven Castle and her escape from it, the defeat of her army at Langside, and her escape into England, are the events best known of any in Scottish history, and it is needless here to enlarge upon them. When Elizabeth thought fit to appoint commissioners, and call witnesses from Scotland for the purpose of substantiating the charges upon which Mary had been expelled from the throne, the main burden of the proof was devolved upon Buchanan, who had accepted favours from the queen indeed, but did not on that account either decline the task of becoming her accuser, or perform it with the less severity. He accordingly accompanied the Regent Murray into England upon that occasion, having composed in Latin a *Detection of Mary's Actions*, which was laid before the commissioners at Westminster, and was afterwards most industriously circulated by the English court. To the same pen has also been ascribed the *Actio contra Marianam Scotorum Reginam*, a coarse and scurrilous invective, which was printed in England along with the *Detection*, but of which no man capable of reading Buchanan's works will

believe that he ever composed one line. "The *Detection*," says an eminent historian, "is a concise historical deduction of facts, a rapid narrative written with that chaste and classical precision of thought and language by which each sentence acquires an appropriate idea distinct from the preceding, neither anticipated, repeated, nor intermixed with others; and the style is so strictly historical that the work is incorporated in Buchanan's history almost without alteration. But the *Action against Mary* is a dull declamation and a malignant invective, written in professed imitation of the ancient orators, whom Buchanan has never imitated, without arrangement of parts, coherence, or a regular train of ideas, and without a single passage which Buchanan in his history has deigned to transcribe." The assassination of the Regent Murray soon after his return from England, threw the nation into a still deeper ferment, and Buchanan, strongly suspicious of the selfish policy of the Hamiltons, which he regarded as the principal source of the calamities that now afflicted the nation, addressed "Ane Admonition direct to the true lordis maintainers of the kingis graces autorite," in which he earnestly adjured them to protect the young king and the children of the late regent from the perils that seemed to impend over them. The same year he composed a satirical delineation of the character of the secretary Lethington, entitled *Chameleon*, which, through the vigilance of the secretary, was prevented from being published at the time. A copy, however, was preserved among the Cotton MSS., dated 1570, and it was printed at London in 1710, in the *Miscellanea Scotica*. It has been often reprinted since. These two pieces appear to be all that he ever composed in his vernacular tongue, and they are of such excellence as to make it matter of regret that he did not turn his attention offener to the cultivation of his native language. As the hopes of the Protestant party were entirely centred in King James, Buchanan was in 1570 selected by the lords of the privy council, and others of the nobility, assembled on occasion of the slaughter of the Regent Murray, to take the superintendence of that important matter, the education of the royal youth. On this occasion he "compeared personally in presence of the said lords of the council, nobility, and others of the estates, and at their desire, and of his own free will and proper motive, demitted and gave over his charge and place of master of the said college (St. Leonard's), in the favours of his well-beloved master, Patrick Adamson, and no otherwise."¹

Buchanan commenced his new duties with ardour; and the very respectable scholarship which his pupil exhibited in after-life shows that so far he executed his task with great success. James had been committed, during his infancy, to the charge of the Earl of Mar—a nobleman of the most unblemished integrity—and he was now in the fourth year of his age. His governor was Sir Alexander Erskine, brother to the Earl of Mar—"a gallant, well-natured gentleman, loved and honoured by all men." The preceptors associated with Buchanan were Mr. Peter Young, and the abbots of Cambuskenneth and Dryburgh, both of them related to the family of Mar. Young

was a man of a mild disposition, respectable both for his talents and learning; and he discharged his office with a prudent attention to his future interests. Recollecting that his pupil was soon to be the sole dispenser of public favour, he was careful to secure his good graces, and of course was afterwards employed in several political transactions of considerable importance, obtained the honour of knighthood, and an annual pension of considerable amount. The two abbots, also, were wise and modest, according to Sir James Melville; but the lady Mar was wise and sharp, and held the king in great awe, and so did Mr. George Buchanan. "But Mr. George," Melville adds, "was a stoic philosopher, who looked not far beforehand; a man of notable endowments for his learning and knowledge of Latin poesy; much honoured in other countries; pleasant in conversation, rehearsing at all occasions moralities short and instructive, whereof he had abundance, inventing when he wanted." The austere spirit of Buchanan was not to be swayed by considerations of self-interest. Called in his old age to the discharge of this task, he seems to have performed it with an entire disregard of personal consequences. The result was, as we have said, that he certainly succeeded in beating a respectable degree of scholarship into his royal pupil, but left James's mind untinted with any respect or affection for his instructor. On the contrary, the king long remembered him with a feeling of horror, and used to say of one of his English courtiers, in the latter part of his life, that he never could help trembling at his approach, he reminded him so strongly of his pedagogue. Concerning Buchanan's treatment of his royal pupil there are preserved more anecdotes than in reference to any other period of his life; which, if we are to believe them, show that he neither spared castigation nor reproach. The master of Erskine, who was the prince's playmate, had a tame sparrow, the possession of which was coveted by James, and ineffectually entreated from the owner. James had recourse to violence in order to obtain what he desired, and the one boy pulled and the other held till the poor sparrow was killed in the struggle. The loss of his little favourite caused the master of Erskine to shed tears, and make, as is usual in such cases, a lusty outcry. This brought the matter under the notice of Buchanan, who, Mackenzie says, "gave the king a box on the ear, and told him that what he had done was like a true bird of the bloody nest of which he had come." A more pleasing anecdote is thus related by Dr. Irving:—"One of the earliest propensities which he [James] discovered, was an excessive attachment to favourites; and this weakness, which ought to have been abandoned with the other characteristics of childhood, continued to retain its ascendancy during every stage of his life. His facility in complying with every request alarmed the prophetic sagacity of Buchanan. On the authority of the poet's nephew, Chytraeus has recorded a ludicrous expedient which he adopted for the purpose of correcting his pupil's conduct. He presented the young king with two papers which he requested him to sign; and James, after having slightly interrogated him concerning their contents, readily appended his signature to each, without the precaution of even a cursory perusal. One of them was a formal transference of the regal authority for the term of fifteen days. Having quitted the royal presence, one of the courtiers accosted him with his usual salutation: but to this astonished nobleman he announced himself in the new character of a sovereign; and with that happy urbanity of humour for which he was so distinguished, he began to assume the high demeanour of royalty.

¹ This is supposed to have been Mr. Patrick Adamson, afterwards Archbishop of St. Andrews, but it does not appear from the records of the university that he ever entered upon his new functions. If we may credit Dr. Mackenzie, Adamson was at this time, or at least shortly after it, in France, whence he did not return till after the Bartholomew massacre. This nomination, therefore, was probably made in his absence; and before he could order his affairs abroad and be ready to enter upon his office, other arrangements might have become necessary.

He afterwards preserved the same deportment towards the king himself; and when James expressed his amazement at such extraordinary conduct, Buchanan admonished him of his having resigned the crown. This reply did not tend to lessen the monarch's surprise, for he now began to suspect his preceptor of mental derangement. Buchanan then produced the instrument by which he was formally invested; and, with the authority of a tutor, proceeded to remind him of the absurdity of assenting to petitions in so rash a manner."

When nominated the king's preceptor, Buchanan was also appointed director of the chancery; but this he does not appear to have long held. The same year he was made keeper of the privy-seal, in the room of John, afterwards Lord Maitland, who was deprived for his adherence to the queen. This office, both honourable and lucrative, and which entitled him to a seat in parliament, he held for several years. In April, 1578, he nominally resigned it in favour of his nephew, Thomas, son of Alexander Buchanan of Sleat; but this seems to have been done only to secure the reversion; for in the following June and July he continued to vote in parliament, and, so late as 1580, was addressed by his foreign correspondents as preceptor and counsellor to King James. In the management of public affairs Buchanan seems to have taken a lively interest, and to have been equally consulted as a politician and a scholar. Accordingly, in 1578, we find him forming one of a numerous commission, among whom was another poet and scholar, Archbishop Adamson, appointed to examine and digest the existing laws—a most desirable object—but one that from its difficulty was never carried fully into effect. He was also included in two commissions for the improvement of education. The first was to rectify an inconvenience arising from the use of different grammars in the schools. Of the committee appointed for this purpose Buchanan was president, and the other members were Messrs. Peter Young, Andrew Sympson, and James Carmichael. They met in Stirling Palace, and were entertained during the continuance of their labours at the charge of the king. Having declared all the grammars in use defective, they resolved that three of their number should compile a new one. To Sympson were assigned the rudiments; to Carmichael what is improperly termed etymology; and to Buchanan the department of prosody. Their respective tracts were committed to the press, and authorized by an order of the king and council; but they continued to be standards of instruction for a very short time, and have long been utterly forgotten. The second commission to which we have referred was appointed by the parliament of 1578 to visit the colleges, to reform such things as tended to Popery, to displace unqualified persons, and to establish such persons therein as they should judge fit for the education of youth. The university of St. Andrews was the subject of the first experiment. Having found many things to alter and redress, the commissioners prepared a scheme of reformation, which was ratified by parliament. This document, written in the Scottish tongue by George Buchanan, is still preserved. The plan of improvement is skilfully delineated, and evidently presupposes that there was no want of learned men in the nation; but it was never carried into effect.

With the regents Murray, Lennox, and Mar, Buchanan was cordially united; but Morton in the end forfeited his good-will by the plans of self-aggrandizement which he so sedulously pursued;¹ and it was

principally by his advice and that of Sir Alexander Erskine that Morton was deposed, and the reins of government put into the king's hands, though he was yet only in his twelfth year. He was of course a member of the privy-council appointed for the young monarch, but seems to have been displaced on Morton's return to power; and we are uncertain if he ever again held any political office. It is probably to this short period of political influence that we are to ascribe the following anecdote of Buchanan, related by Dr. Gilbert Stuart in his *Observations concerning the Public Law and the Constitutional History of Scotland*:—"In feudal times," that writer observes, "when the sovereign upon his advancement to the royalty was to swear fidelity to his subjects, and to pay homage to the laws, he delivered his naked sword into the hands of the high constable. 'Use this in my defence,' said he, 'while I support the interests of my people; use it to my destruction when I forsake them.'" In allusion to this form, Buchanan made a naked sword to be represented on the money coined in the minority of James VI., with these words, *Pro me; si mecor, in me.*"

A list of twenty-four Scotsmen has been preserved, whom, on the king's assuming the reins of government, Elizabeth thought it necessary to attach to her interest by pensions, and among these Buchanan stands at £100 per year—no contemptible sum in those days—and the same that was assigned to some of the first nobles of the land. There is no evidence that he ever received this gratuity, or that it was offered to him. Mackenzie, however, states it as a certainty, and adds that the composition of his *De Jure Regni apud Scotos* was the grateful service he performed in return—an assertion not likely, considering that the doctrines of this book were not very consonant to the views of that high-minded princess. The *De Jure* was composed principally with a view to instruct his royal pupil in what belonged to his office.

In 1576 he prepared his *Baptistes*, and dedicated it to the young king, with a freedom of sentiment bordering upon disrespect, which is to be regretted, because, if his lessons had been conveyed in a less dictatorial manner, there would have been more likelihood of their being attended with advantage. "This trifle may seem," he says, "to have a more important reference to you, because it clearly discloses the punishment of tyrants, and the misery which awaits them even when their prosperity is at the highest. Such knowledge I consider it not only expedient but necessary that you should acquire, in order that you may early begin to hate what you ought always to shun: and I wish this work to remain as a witness to posterity that, if impelled by evil counsellors, or suffering the licentiousness of royalty to prevail over a virtuous education, you should hereafter be guilty of any improper conduct, the fault may be imputed not to your preceptors, but to you who have not obeyed their salutary admonitions." Three years after, in 1579, he published the above-mentioned compendium of political philosophy, the professed object of which is to delineate the rights of the Scottish crown. The origin of the work, which is sufficiently remote from that assigned by Mackenzie, is fully detailed in the dedication to the king, which is of so peculiar a character, that it would be unpardonable to pass it over. "Several years ago," he begins, "when our affairs were in a most turbulent

of his chanced to be taken from his servant during the civil troubles, and was bought by the regent, who had no will to part with the said horse, because he was sure-footed and easy; but because he would not part with him, from being the regent's great friend, he became his mortal enemy, and from that time forth spoke evil of him at all times and upon all occasions."

¹ Sir James Melville assigns a different, and perhaps equally powerful, reason for Buchanan's disagreement with Morton: "He became the Earl of Morton's great enemy, for that a nag

condition, I composed a dialogue on the prerogatives of the Scottish crown, in which I endeavoured to explain, from their very cradle, if I may adopt that expression, the reciprocal rights and privileges of kings and their subjects. Although the work seemed to be of some immediate utility by silencing certain individuals, who, with impertunate clamours, rather inveighed against the existing state of things than examined what was conformable to the standard of reason, yet in consequence of returning tranquillity, I willingly consecrated my arms to public concord. But having lately met with this disputation among my papers, and supposed it to contain many precepts necessary for your tender age (especially as it is so conspicuously elevated in the scale of human affairs), I have deemed its publication expedient, that it may at once testify my zeal for your service, and admonish you of your duty to the community. Many circumstances tend to convince me that my present exertions will not prove fruitless, especially your age yet uncorrupted by perverse opinions, a disposition above your years spontaneously urging you to every noble pursuit; a facility in obeying not only your preceptors, but all prudent monitors—a judgment and dexterity in disquisition which prevents you from paying much regard to authority, unless it be confirmed by solid argument. I likewise perceive that by a kind of natural instinct you so abhor flattery—the nurse of tyranny, and the most grievous pest of a legitimate monarchy—that you as heartily hate the courtly solecisms and barbarisms as they are relished and affected by those who consider themselves as the arbiters of every elegance, and who, by way of seasoning their conversation, are perpetually sprinkling it with majesties, lordships, excellencies, and, if possible, with expressions still more putid. Although the bounty of nature and the instruction of your governors may at present secure you against this error, yet am I compelled to entertain some slight degree of suspicion, lest evil communication—the alluring nurse of the vices—should lend an unhappy impulse to your still tender mind, especially as I am not ignorant that with what facility the external senses yield to seduction. I have therefore sent you this treatise, not only as a monitor, but even as an impertunate and sometimes impudent dun, who in this turn of life may convey you beyond the rocks of adulation, and may not merely offer you advice, but confine you to the path which you have entered; and if you should chance to deviate, may reprehend you, and recall your steps. If you obey this monitor, you will insure tranquillity to yourself and to your subjects, and will transmit a brilliant reputation to the most remote posterity.” The eagerness with which this work was sought after by those of Buchanan’s own principles on the Continent is manifested by a letter from one of his correspondents. “Your dialogue *De Jure Regni*,” says this epistle, “which you transmitted to me by Zolcher, the letter-carrier of our friend Sturmius, I have received—a present which would be extremely agreeable to me if the impertunate entreaties of some persons did not prevent me from enjoying it; for the moment it was delivered into my hand Dr. Wilson requested the loan of it; he yielded it to the impertunity of the chancellor, from whom the treasurer procured a perusal of it, and has not yet returned it; so that, to this day, it has never been in my custody.”

Amidst multiplied labours Buchanan was now borne down with the load of years, aggravated by the encroachments of disease. His poetical studies seem now to have been entirely suspended, but his history of Scotland was unfinished, and was probably still receiving short additions or finishing touches. His life, too, at the request of his friends,

he compiled when he had reached his seventy-fourth year, and his epistolary correspondence, which was at one time very extensive, was still continued with some of the friends of his earlier days. He had been long in the habit of writing annually, by some of the Bordeaux merchants, to his old friend and colleague Vinetus, and one of these letters, written in March, 1581, the year before his death, gives a not unpleasant picture of his state of feeling. “Upon receiving accounts of you,” he says, “by the merchants who return from your courts, I am filled with delight, and seem to enjoy a kind of second youth, for I am there apprised that some remnants of the Portuguese peregrinations still exist. As I have now attained to the seventy-fifth year of my age, I sometimes call to remembrance through what toils and inquietudes I have sailed past all those objects which men commonly regard as pleasing, and have at length struck upon that rock beyond which, as the ninetieth psalm very truly avers, nothing remains but labour and sorrow. The only consolation that now awaits me, is to pause with delight on the recollection of my coeval friends, of whom you are almost the only one who still survives. Although you are not, as I presume, inferior to me in years, you are yet capable of benefiting your country by your exertion and counsel, and even of prolonging, by your learned compositions, your life to a future age. But I have long bade adieu to letters. It is now the only object of my solicitude, that I may remove with as little noise as possible from the society of my ill-assorted companions—that I who am already dead, may relinquish the fellowship of the living. In the meantime I transmit to you the youngest of my literary offspring, in order that when you discover it to be the drivelling child of age, you may be less anxious about its brothers. I understand that Henry Wardlaw, a young man of our nation, and the descendant of a good family, is prosecuting his studies in your seminary with no inconsiderable application. Although I am aware of your habitual politeness, and you are not ignorant that foreigners are peculiarly entitled to your attention, yet I am desirous he should find that our ancient familiarity recommends him to your favour.” Thuanus, who had seen this epistle in the possession of the venerable old man to whom it was addressed, says it was written with a tremulous hand, but in a generous style.

The last of Buchanan’s productions was his history of Scotland, which it is doubtful whether he lived to see ushered fairly into the world or not. By the following letter to Mr. Randolph, dated at Stirling in the month of August, 1577, it would appear that this work was then in a state of great forwardness: “Maister, I haif reasavit diverse letters from you, and yit I haif ansourit to naine of thame, of the quhylyke albiet I haif mowy excusis, as age, forgetfulness, besines, and descease, yit I wyl use nane as now except my sweirness and your gentilness, and geif ye thynk nane of these sufficient, content you with ane confession of the falt wtout fear of punnition to follow on my onkindness. As for the present, I am occupiit in wryting of our historie, being assurit to content few and to displease mony tharthrow. As to the end of it, yf ye gett it not or thys winter be passit, lippen not for it, nor nane other wrytyngs from me. The rest of my occupation is wyth the gont, quhylk haldis me busy bath day and nyt. And quhair ye say ye haif not lang to lyif, I trust to God to go before you, albiet I be on fut and ye ryd the post [Randolph was post-master to the queen’s grace of England] prayin you als not to dispost my host at Newerk, Jone of Kilsterne.

Thys I pray you, partly for his awyne sake, quhame I thot ane gude fellow, and partly at request of syk as I dare not refuse, and thus I take my leif shortly at you now, and my lang leif quhen God pleasis, committing you to the protection of the Almyty." By this letter it is evident that he expected to publish his history immediately. A long delay, however, took place; for when, in September, 1581, he was visited by Andrew Melville, James Melville, and his cousin Thomas Buchanan, the work was only then printing. Of this visit, James Melville has left a most interesting account. "That September in tyme of vacans, my uncle Mr. Andro, Mr. Thomas Buchanan, and I, heiring yt Mr. George Buchanan was weak, and his historie under ye press, past ower to Edinbro annes earand to visit him and sie ye wark. When we cam to his chalmere we fand him sitting in his charre teaching his young man that servit him in his chalmere to spel a, b, ah; e, b, eb, &c. After salutation, Mr. Andro says, 'I sie, sir, ye are not ydle.' 'Better,' quoth he, 'than stelling sheep or sitting ydle, whilk is als ill.' Yrefter he shew us the epistle dedicatorie to the king, the quhylk when Mr. Andro had read, he told him that it was obscure in some places, and wanted certain wordis to perfy the sentence. Says he, 'I may do na mair for thinking on another matter.' 'What is that,' says Mr. Andro. 'To die,' quoth he; 'but I leave that an mony ma things to you to help.' We went from him to the printer's wark hous, whom we fand at the end of the 17 buik of his chronicle, at a place quhilk we thought verie hard for the tyme, quhilk might be an occasion of steying the hail wark, anent the burial of Davie [David Rizzio]. Therefore steying the printer from proceeding, we cam to Mr. George again, and fand him bedfast by [contrary to] his custome, and asking him whow he did, 'Even going the way of weifare,' says he. Mr. Thomas, his cousin, shaws him of the hardness of that part of his story, yt the king wald be offendit wt it, and it might stey all the wark. 'Tell me, man,' says he, 'if I have told the truth.' 'Yes,' says Mr. Thomas, 'I think sa.' 'I will byd his feide and all his kin's, then,' quoth he. 'Pray, pray to God for me, and let him direct all.' Sa be the printing of his chronicle was endit, that maist learned, wyse, and godlie man endit this mortal lyff."

The printing of the history must have gone on very slowly, for though it was printed as above, up to the seventeenth book, it was not finished till nearly a year after, the dedication to the king being dated August 29, 1582, only thirty days before the death of the author, which happened on Friday the 28th of September following, when he had reached the age of seventy-six years and eight months. He died in much peace, expressing his full reliance on the blood of Christ. He was buried in the Greyfriars churchyard, a great multitude attending his funeral. A throughoutstone, with an inscription, is said to have marked his grave; but the inscription has long been invisible, and the existence of the stone itself appears to be more than doubtful. An obelisk has, by the gratitude of posterity, been reared to his memory in his native village, Killearn. His death, like that of all men who live out the full term of human life, excited less emotion than might have been expected. Andrew Melville, who had often celebrated him while alive, discharged the last debt of lettered friendship in an elegant Latin poem; Joseph Scaliger also wrote an epitaph for him in terms of liberal and appropriate praise.

Buchanan was never married, and left, of course, no children to perpetuate his memory; and though he held latterly one of the great offices of state, and

possessed other considerable sources of emolument, he acquired no great estates, and his whole property at his death consisted of £100, arrears due upon his pension of Crossraguell.

A story is told, upon the authority of the Earl of Cromarty, who had it from his grandfather Lord Inverclyde, that Buchanan, on his death-bed, finding the money he had about him insufficient to defray the expenses of his funeral, sent his servant to divide it among the poor; adding, that if the city, meaning its authorities, did not choose to bury him, they might let him lie where he was, or throw his corpse where they pleased. This anecdote has been by some rejected as apocryphal; but there is no proof of its untruth, and it certainly does not startle us on account of any incongruity with Buchanan's character, which was severe, even to moroseness. He had passed through almost every vicissitude of human life, and stern and inflexible, perhaps he had less sympathy with human frailty than the weaknesses of most men require. He was subject to that irritability of feeling which frequently attends exalted genius, but manifested at all times a noble generosity of spirit, which made him be regarded by his friends with a warmth of affection which mere intellectual eminence, though it were that of an archangel, could never inspire. By the general voice of the civilized world he held a pre-eminence in literature that seemed to render competition hopeless; but his estimate of his own attainments was consistent with the most perfect modesty, and no man was more ready to discover and acknowledge genuine merit in others. His brilliant wit and unaffected humour rendered his society highly acceptable to persons of the most opposite tastes and dispositions.

In 1584, only two years after the publication of the history, it was condemned along with *De Fure Regni* by the parliament of Scotland, and every person possessed of copies commanded to surrender them within forty days, in order that they might be purged of the offensive and extraordinary matters which they contained.

We shall close this sketch of Buchanan's life with the concluding reflections of his learned biographer Dr. Irving. "In his numerous writings," says the doctor, "he discovers a vigorous and mature combination of talents which have seldom been found united in equal perfection. According to the common opinion, intellectual superiority is almost invariably circumscribed by one of the two grand partitions which philosophers have delineated; it is either founded on the predominance of those capabilities which constitute what is termed the imagination, or of those which, in contradistinction, are denominated the understanding. These different powers of exertion, though certainly not incompatible with each other, are but rarely found to coalesce in equal maturity. Buchanan has, however, displayed them in the same high degree of perfection. To an imagination excursive and brilliant he unites an undeviating rectitude of judgment. His learning was at once elegant, various, and profound. Turnebus, who was associated with him in the same college, and whose decisions will not be rashly controverted, has characterized him as a man of consummate erudition. Most of the ancient writers had limited their aspiring hopes to one department of literature; and even to excel in one demands the happy perseverance of a cultivated genius. Plato despaired of securing a reputation by his poetry. The poetical attempts of Cicero, though less contemptible perhaps than they are commonly represented, would not have been sufficient to transmit an illustrious name to future ages.

Buchanan has not only attained to excellence in each species of composition, but in each species has displayed a variety of excellence. In philosophical dialogue and historical narrative, in lyric and didactic poetry, in elegy, epigram, and satire, he has never been equalled in modern, and hardly surpassed in ancient times. A few Roman poets of the purest age have excelled him in their several provinces, but none of them has evinced the same capability of universal attainment. Horace and Livy wrote in the language they had learned from their mothers, but its very acquisition was to Buchanan the result of much youthful labour. Yet he writes with the purity and elegance of an ancient Roman. Unfettered by the classical restraints which shrivel the powers of an ordinary mind, he expatiates with all the characteristic energy of strong and original sentiment; he produces new combinations of fancy, and invests them with language equally polished and appropriate. His diction uniformly displays a happy vein of elegant and masculine simplicity, and is distinguished by that propriety and perspicuity which can only be attained by a man perfectly master of his ideas and of the language in which he writes. The variety of his poetical measures is immense, and to each species he imparts its peculiar grace and harmony. The style of his prose exhibits correspondent beauties; nor is it chequered by phraseologies unsuitable in that mode of composition. His diction, whether in prose or verse, is not a tissue of centos; he imitates the ancients as the ancients imitated each other. No Latin poet of modern times has united the same originality and elegance; no historian has so completely imbibed the genius of antiquity, without being betrayed into servile and pedantic imitation. But his works may legitimately claim a higher order of merit—they have added no inconsiderable influx to the general stream of human knowledge. The wit, the pungency, the vehemence of his ecclesiastical satires, must have tended to foment the general flame of reformation; and his political speculations are evidently those of a man who had soared beyond the narrow limits of his age." All these remarks the reader will observe refer to the original Latin in which all the works of Buchanan, with the exception of the two which we have particularized, are written. The *Dialogue* has been frequently reprinted, and several times translated. Of the *History*, which was printed by Alexander Arbuthnot at Edinburgh, 1582, there have been published seventeen editions. It was translated into the Scottish language by John Reid, who, according to Calderwood's MS., was servitor to Mr. George Buchanan. A MS. of this unpublished version is in the library of the university of Glasgow. Another unpublished version is in the British Museum. In 1690, an English translation, with a portrait of the author, was printed in folio. This version has gone through five or six editions, and is to be frequently met with. It is a clumsy performance, and gives some such idea of Buchanan as a block from the quarry gives of the highly finished statue. A much better translation has recently appeared, from the pen of James Aikman, Esq., forming the first part of *Aikman's History of Scotland*. It is an honour yet awaiting some future scholar, to give to his unlettered countrymen to feel somewhat of the grace and strength that characterize the performances of George Buchanan.

BURNES, SIR ALEXANDER. This distinguished officer, whose varied talents were so available in the administration of the British government in India, and whose premature and violent death

was so deeply deplored, was born in the town of Montrose, on the 16th of May, 1805. His father, a magistrate of Forfarshire, had held the chief official situations of the burgh of Montrose, while his grandfather was brother to William Burnes, the parent of our illustrious national poet. It is well known to the readers of the life of Robert Burns, that the family name had always been spelled Burnes, and that his father was the first who dropped the letter *e* in its signature. Alexander was educated at Montrose academy, and having obtained a cadetship when he left school at the age of sixteen, he set sail for India, and arrived at Bombay on October 31, 1821. So successful had been his studies for his new sphere of active duty, that at the close of the year after that of his arrival in India, he was appointed interpreter in Hindostanee to the first extra battalion at Surat. His proficiency in the Persian tongue had also been so rapid as to secure the confidence of the judges of the *Sudder Adawlut*, so that he was appointed translator of the Persian documents of that court, without any solicitation of his own. His talents for civil occupation were soon so conspicuous as to secure him rapid promotion in that Indo-British government, whose very existence depends upon the superiority of intellect alone, and after having filled the offices of ensign and quartermaster of brigade, he was confirmed in the office of deputy-assistant quartermaster-general at the age of twenty-one, at which period, also, he drew up an elaborate report on the statistics of Wagur, a paper for which he received the thanks of the governor and members of the council of Bombay. In 1828 he was honoured by a similar testimony for a memoir on the eastern mouth of the Indus; and in September, 1829, he was appointed assistant to the political agent in Cutch, for the purpose of effecting a survey of the north-west border of that province. Burnes, who had been there four years previous, as ensign of the 21st Bombay Native Infantry during the disturbances of that quarter, returned in his new capacity, and discharged his task with his wonted ability and success. His account of this survey is contained in the *Transactions of the Royal Geographical Society for 1834*.

The talents of Burnes as an oriental linguist and statist, having thus been tested, were summoned to higher exertion. In the growth of our Indo-British empire, it was necessary that the Indus should be thrown open to our ships, but, at the same time, without exciting the jealousy of those wild tribes who regarded the river as the pledge of their national freedom. It was accordingly resolved that this object should be covertly accomplished, by means of a political mission ostensibly directed to a different purpose. A present of five splendid horses, accompanied by a letter from the sovereign of Great Britain, were to be consigned to Runjeet Singh, the celebrated Maharajah of the Punjab; and on the way to Lahore for that purpose, Lieutenant Burnes, by whom the mission was to be conducted, was to travel by the circuitous route of Scinde. He was provided with letters to the chieftains of the province, and to conceal the real purpose of his journey, he was accompanied by a guard of wild Beeloochees, instead of a troop of British soldiers, whose appearance would have raised suspicion. Thus provided, Burnes reached the mouth of the Indus on the 28th of January, 1831. He had now a difficult diplomatic task to perform, for the Ameers of Scinde had taken the alarm, and every impediment was thrown in the way of his further progress. This, however, was nothing more than what he wished; for, during the delay of their feigned negotiations, he had made

a complete survey of the mouths of the river, and constructed a map of the lower part of its course; he also obtained their full permission to continue his journey on the Indus, instead of travelling by land, and their assent that thenceforth it should be left open to the transit of British merchandise. Proceeding along the river by water, and visiting every place of interest upon his way, he at length reached Lahore on the 18th of July. As the real part of his journey was already accomplished, all that remained was little more than a mere political visit of ceremony, graced with all the showy forms of an oriental embassy, and an amusing account of which he has given us in the third volume of his *Travels in Bokhara*. Splendid retinues, with abundance of trumpeting and cannon-firing, welcomed him into the capital of the modern Timour; and on entering the palace, he suddenly found himself locked in the embrace of a diminutive old man, who was no other than Runjeet Singh himself, eager to do him honour, and who had advanced thus far to welcome him. After sojourning till the middle of August at the court of Runjeet Singh, Burnes left Lahore, crossed the Sutledge, and proceeded to Loodiana, where he became acquainted with Shah Zeman and Shah Soojah, who had formerly been kings of Cabool, but were now disrowned, and living under British protection. At Simla, he met Lord William Bentinck, the governor-general, who forthwith proceeded to avail himself of Burnes' mission, by negotiations for opening the navigation of the Indus.

After this successful expedition, Burnes proposed to undertake an exploratory journey into Central Asia, and the Indian government having sanctioned the proposal, he commenced this new and adventurous journey in January, 1832. As yet, much of the interior of our vast Indian empire was but little known, and even the charts of many districts that had been penetrated by British travellers were still incorrect or defective. One important advantage of this journey of Burnes was an addition to the map of Arrowsmith, the most valuable of our Indian charts, to which he supplied some of its best improvements. As it was necessary to pass through Scinde in his route, he had previously obtained permission to that effect from his powerful friend the maharajah. He therefore once more entered Lahore, at which he arrived on the 17th of January, and was cordially welcomed by Runjeet Singh; and after a stay there till the 11th of February, he crossed the Ravee, and having halted one night in a house beside the monument of Jehangur, he prepared for the dangerous part of his journey. It was necessary for this purpose that he should be completely disguised, and therefore he assumed the dress and habits, and as much as possible the appearance, of an Afghan. He had for the companion of his journey, Mr. James Gerard, surgeon of the Bengal army, who clothed himself with a similar costume; and, after leaving behind them every article of their luggage that might indicate their country or purpose, the travellers commenced their pilgrimage of peril, escorted by a body of troops provided by the maharajah. They were thus accompanied to the frontier of Runjeet's dominions, a short distance on the further side of the Attock, where they met the Afghans, by whom they were escorted to Acora. They afterwards successively reached Peshawur, Jellalabad, and Cabool; scaled the lofty passes of Oonna and Hageegak, on the latter of which, 12,400 feet in height at its highest point, the frost was so intense that the snow bore the weight of their horses, and the thermometer fell to 4° of Fahrenheit. On attempting subsequently to surmount the pass of Kalao, which is a thousand feet

higher, they found it so blocked up with snow as to be impassable, and were compelled to choose another route, by which they reached Ghoologool, that city, or rather valley of ruins, famed for its two colossal statues, the largest of which is 120 feet in height, and for the hills that inclose the valley, which are absolutely honey-combed with excavations. They then crossed the pass of Acrobat; and descending from the mountains of the Indian Caucasus, they entered the vast plains of Tartary. At Khoolum, the frontier town of Morad Beg, chief of Khoondooz, the bold travellers were met by a startling message from that potentate, requiring Burnes to wait upon him at Kaumabad, a village about fifty miles off. Obedience was unavoidable; and therefore, leaving Mr. Gerard at Khoolum, Burnes repaired to Kaumabad, and presented himself before the chief in tattered and threadbare garments, under the character of a poor Armenian watchmaker travelling from Lucknow to Bokhara. A moment's timidity on his part, or suspicion on that of the Asiatic lord, might have cost the traveller his life; but, fortunately, his statement was believed, so that he received a safe-conduct to continue his journey, and he left Kaumabad in the company of a small caravan of nine or ten tea-merchants.

This danger being thus happily got over, Burnes rejoined Mr. Gerard at Khoolum. Their route was continued, and they arrived at Balkh, that wondrous city of history and romance, with which our childhood and youth were made so familiar. Now a heap of ruins in the midst of a glory that has passed away, but still covering an extent of twenty miles with its fragments; it is a fitting monument of the many empires to which it has belonged; for here the Greek, Persian, Arabian, Tartar, and Afghan have successively ruled. Strange, therefore, have been the changes it has witnessed since the time that it was the Bactra of Alexander the Great! After halting for three days in this interesting compend of ancient and modern history, Burnes and Gerard entered the desert on the 14th of June, and, two days after, they reached the banks of the Oxus, that most important of Asiatic rivers, which bounded the conquests of Cyrus, and all but terminated those of Alexander. At that part which our travellers crossed, the river was about 800 yards wide, and twenty feet deep, where the transit was made in boats neither impelled by sail nor oar, but drawn by a couple of stout horses that swam across. Continuing their course, they reached on the 27th of June the city of Bokhara, the capital of the country of that name; a city whose remaining colleges still justify its ancient renown for learning and civilization, and the high encomiums which eastern poets heaped upon it. After waiting in the neighbourhood of the city of Kara-kool till the 16th of August, Burnes and Gerard resumed their journey in the company of a caravan consisting of 150 persons and eighty camels, the former travelling in very simple fashion, some on horses, some on asses, and several in panniers slung across the backs of camels. With this escort our travellers passed the great desert by Merve, and on the 17th of September reached the strong fortress of Koochan, where they parted, Gerard intending to proceed to Herat and Candahar, and afterwards return to Cabool. Burnes continued his journey in the company of 300 persons, chiefly Khoonds, Persians, and Turcomans—three of the eleven races with which the province of Bokhara is peopled—until he had passed Boojnoord, when he continued his journey alone to the town of Astrabad. He then crossed an arm of the Caspian, and proceeded to Teheran, the modern capital of Persia, where he had the honour

of being presented to the shah. Such is a brief outline of one of the perilous and laborious journeys in which a chivalrous love of science enables the modern traveller to dare and endure the utmost that knight-errantry has recorded of its ancient votaries.

The object of this expedition having been successfully attained, Burnes was eager to return by the shortest and safest route to head-quarters, and report his proceedings. He therefore embarked at Bushire for Bombay, which he reached on the 18th of January, after a year's absence. The information he had gathered during this adventurous journey, and which he hastened to lay before the government, was so valuable in the statistical and geographical history of these countries with which India is so closely connected, that he received the especial thanks of the governor-general, and was honoured besides with the commission of carrying his own despatches to England. He accordingly set sail for London, where his services were so highly appreciated, that he not only met with the most flattering reception at the India House, but was honoured with the especial thanks of his sovereign. Fresh distinctions crowded upon him as soon as the results of his labours were known to the public. The narrative of his journey was immediately translated into French and German; he was elected a member of the Royal Asiatic Society, and of the Royal Geographical Society; and presented with the gold medal, and royal premium of fifty guineas, for *The Navigation of the Indus, and a Journey by Balkh and Bokhara across Central Asia*. Nor were these acknowledgments of his services in behalf of science, literature, and humanity, confined to his own country; for, on paying a short visit to Paris, he was welcomed with general enthusiasm as one of the most talented and adventurous of modern travellers, and presented with the silver medal of the French Geographical Society.

The stay of Burnes at home after so long a residence in India, was only for eighteen months, after which he left England on April 5, 1835, and proceeding by the south of France, Egypt, and the Red Sea, he reached Bombay on the 1st of June, and joined Colonel Pottinger, the British resident at Cutch, as his assistant. Only a few months after, he was sent upon a mission to Hyderabad, to prevent the necessity of a war with Scinde, in which he was successful. While thus occupied in that country, a more important duty was intrusted to him; this was, to negotiate a commercial treaty with Dost Mohammed, sovereign of Afghanistan, and also with the Indian chiefs of the western provinces. He reached Cabool on the 20th of September, 1837. Here, however, he found that his mission was useless, from the danger that menaced our Indian empire through the movements and intrigues of Persia and Russia, and the likelihood of their uniting with the Afghans, while Dost Mohammed, instigated by the Russian agent at his court, gave Burnes an order of dismissal. On his return to head-quarters, it was resolved by our Indian government to replace their pensionary, Shah Soojah, upon the throne of Cabool, as a more peaceable or compliant ally than Dost Mohammed; and Burnes was sent to the army to make arrangements in the commissariat department, preparatory to the invasion of Afghanistan. While thus occupied, he was gratified to learn that his valuable services had not been forgotten at home, for at Shikarpoor he received a copy of the *London Gazette*, announcing his promotion to the honour of knighthood and the rank of lieutenant-colonel. Before the commencement of military operations, Sir Alexander Burnes was sent on a political mission

from Scinde to Beeloochistan, that failed, upon which he regained the British invading army, that had already advanced, through many difficulties, as far as the fertile valley of Quettah. Here he had hard military service in the shape of a toilsome march, accompanied with danger and privation of every kind, as well as in the storming of Ghuznee, which was only wrested from the Afghans after a close and desperate hand-to-hand fight of three hours. After this important city was won, Hyder Khan, its governor, one of the sons of Dost Mohammed, who had surrendered himself to the British, was placed under the care of Sir Alexander Burnes. Soon after, Dost Mohammed fled from the kingdom, Shah Soojah was replaced in the sovereignty, and such was the appearance of submission on the part of the Afghans, that Sir William M'Naughten was left as British envoy at the court of Cabool, with Sir Alexander Burnes for his assistant. But, unfortunately, this season of calm was soon overcast. The impatient Afghans resumed their insurrectionary spirit, and on several occasions broke forth into revolts that were suppressed with difficulty. Still, however, neither M'Naughten nor Burnes seem to have anticipated any immediate danger, notwithstanding the warnings of Major Pottinger, for 14,000 British soldiers were stationed in Afghanistan, independent of the troops of the new shah. But, on the 2d November, 1841, the storm suddenly burst out. At nine o'clock in the morning, the house of Burnes in Cabool was attacked and set on fire by the insurgent multitude, and himself, his brother Lieutenant Charles Burnes, Lieutenant Broadfoot, and every man, woman, and child in the building, were murdered. It was the commencement of a fearful tragedy, of which a disastrous retreat, and the destruction of 26,000 individuals by exhaustion and the sabres of the pursuing Afghans were the mournful termination.

Sir Alexander was never married, and was survived by his parents and three brothers. Besides his *Travels in Bokhara*, and several papers in the *Journal of the Royal Geographical Society of London*, he was author of a work entitled *Cabool; being a Narrative of a Journey to and Residence in that City, in the years 1836-7-8*, which was published after his death.

BURNET, GILBERT, Bishop of Salisbury, and an historian of great eminence, was born at Edinburgh on the 18th of September, 1643. His father was a younger brother of a family possessing considerable interest in the shire of Aberdeen, and was bred to the law, which he followed with great success. He was eminent for his probity, and his generosity was such that he never took a fee from the poor, nor from any clergyman, when he sued in the right of his church. In his morals he was strict, and his piety procured him the reproach of being a puritan; yet he was episcopal in his judgment, and adhered to the bishops and the rights of the crown with great constancy, and three several times he left the kingdom to avoid taking the covenant. On one of these occasions he was an exile for several years, and though his return was latterly connived at, he was not permitted to resume the practice of the law, but lived in retirement upon his estate in the country till the Restoration, when he was promoted to be a lord of session. The mother of our author was not less conspicuous than his father, being a sister of Lord Warriston, and, like him, a great admirer of the Presbyterian discipline.

In consequence of his seclusion from business, Mr. Burnet took the education of his son in the early part

of it wholly upon himself, and he conducted it so successfully, that at the age of ten years, Gilbert was sufficiently acquainted with the Latin tongue, as to be entered a student in the college of Aberdeen, where he perfected himself in Greek, went through the common methods of the Aristotelian logic and philosophy, and took his degree of M.A. before he was fourteen. After this, much to the regret of his father, who had all along intended him for the church, he commenced the study of the law, both civil and feudal, in which he made very considerable progress. In the course of a year, however, he altered his resolution, and, agreeably to the will of his father, devoted himself wholly to the study of divinity, in which, with indefatigable diligence, studying commonly fourteen hours a day, he made a rapid progress, having gone through the Old and New Testaments, with all the commentaries then in repute, as well as some of the most approved systems of school divinity, before he was eighteen years of age; when, having passed the usual routine of previous exercises, which at that time were nearly the same in the Presbyterian and Episcopal churches, he was licensed as a probationer or preacher of the gospel. His father was about this time appointed a lord of session, and his cousin-german, Sir Alexander Burnet, gave him the presentation to an excellent benefice, which lay in the very centre of all his relations. He refused to accept of it, however, on account of his youth, notwithstanding the importunities of all his friends, his father excepted, who left him entirely to his own discretion. His father dying shortly after this, and one of his brothers, Robert, having become famous at the bar, his mother's relations eagerly desired him to return to his former studies, the law, in which they assured him of the most flattering encouragement; but he was immovably fixed in his purpose of devoting his life to the service of the church. In this resolution he was greatly confirmed by the Rev. Mr. Nairn, who at that time filled the Abbey church of Edinburgh, and took a deep interest in him. Mr. Nairn was reckoned one of the most eloquent of the Scottish preachers, and afterwards became well known in the west of Scotland as one of "Archbishop Leighton's Evangelists." He was remarkable in his discourses for accuracy of style, strength of reasoning, and lofty flights of imagination; yet he always preached extempore, considering the task of writing his discourses as a loss of time. Young Burnet was his great admirer, and learned from him to preach extemporaneously, which he did all his life with great ease, by allotting a part of every day to meditation on all sorts of subjects, speaking all his thoughts aloud, and studying to render his expressions fluent and correct. To Mr. Nairn, also, he was indebted for his acquaintance with various celebrated works, particularly Dr. More's works, the writings of Plato, and Hooker's *Ecclesiastical Polity*, by the principles of which he professed to be guided through life. In 1662 he became acquainted with Bishop Leighton, who, conceiving a great affection for him, took a particular delight in overlooking his studies. Through this amiable divine, he became acquainted with the primitive writers, going through all the apologies of the fathers of the three first centuries, and Binnius' *Collections of Councils*, down to the second council of Nice. He had the good fortune, about this same time, to contract an intimacy with Mr. Laurence Charteris, a man of great worth and gravity, who was not only a solid divine, but an eminent master of history, both ancient and modern, well acquainted with geography, and a profound mathematician, and who also took a deep

interest in finishing the education of his young friend, which had been so happily begun, and so successfully carried on.

In 1663 Burnet made an excursion into England, taking Cambridge and Oxford in his way. At the first of these, he had the pleasure of being introduced to Drs. Cudworth, Pearson, Burnet (author of the *Theory of the Earth*), and More. At the latter place he met with great attention, particularly from Drs. Fell and Pocock, on account of his ready knowledge of the fathers and ancient councils. Here he improved his mathematics by the instructions of Dr. Wallis, who gave him a letter of introduction to that great philosopher and Christian, Mr. Robert Boyle, at London. In London he was introduced to all the eminent divines of that period, Tillotson, Stillingfleet, Patrick Lloyd, Whitecot, and Wilkins, all of whose characters he lived to draw in his history. Here also he had the advantage of the conversation of Sir Robert Murray, who introduced him into the first circles of society, acting at the same time the part of a faithful monitor, in pointing out to him those errors and indiscretions into which he was in danger of falling from his youth and inexperience.

After spending six months in this agreeable manner, he returned to his native country, where he was again pressed to enter into orders, and to accept of a charge in the west, which he could not be prevailed on to do. Hearing of his great fame, Sir Robert Fletcher of Salton, who had been acquainted with, and had received many obligations from, his father at Paris, sent for him at this time to his country-seat, and after hearing him preach, offered him that parish, the minister having just been nominated to one of the bishoprics. Burnet would have excused himself, as he intended travelling to the Continent, and solicited the place for his friend Nairn; but Sir Robert would take no denial, being resolved to keep the place vacant till his return.

In 1664 the subject of this memoir went over to Holland, and after seeing what was most remarkable in the Seven Provinces, fixed his residence at Amsterdam, where, under the care of a learned rabbi, he perfected himself in the Hebrew language. He also became acquainted here with the leading men of many different sects, among all of whom he declared he found so much real piety and virtue, that he became fixed in a strong principle of universal charity, and conceived an invincible abhorrence of all severities on account of differences in the profession or forms of religion. From Holland, by the way of the Netherlands, he passed into France, where, at Paris, he had the pleasure of conversing frequently with Dailé and Morus, the two Protestant ministers of Charenton, the former renowned for his learning and judgment, the latter for shining abilities and unrivalled eloquence. His stay in France was prolonged on account of the kindness with which he was treated by Lord Hollis, then ambassador at the French court. Towards the end of the year, however, he returned to Scotland by the way of London, where, by the president, Sir Robert Murray, he was introduced as a member of the Royal Society. On arriving at Edinburgh, he was waited upon by Sir Robert Fletcher, who carried him down to Salton, and presented him to the parish, which he declined taking absolutely, till he should have the joint request of all the parishioners. This he very soon obtained without one single exception, and was ordained a priest by the Bishop of Edinburgh in the year 1665. At Salton he remained for five years, a bright example of what parish ministers ought to be. He preached twice every Sabbath, and once through the week. He catechized three times a week, so as to

examine every parishioner, old and young, three times in the compass of the year. He went round his parish, from house to house, instructing, re-proving, or comforting the inmates, as occasion required. The sick he visited often twice a day. The sacrament he dispensed four times a year, and he personally instructed all such as gave notice that they intended to receive it. Of his stipend,¹ all that remained above his own necessary subsistence, he gave away in charity. On one occasion, a parishioner who had been in execution for debt, asked him for a little to help his present exigency; he inquired how much it would take to set him up again in his business, and on being told, ordered his servant to go and give him the money. "Sir," said his servant, probably piqued at his generosity, "it is all the money we have in the house." "It is well," was the reply; "go and pay it to the poor man. You do not know the pleasure there is in making a man glad." We need not wonder that such a man had the affections of his whole parish, even of the Presbyterians, though he was then the only minister in Scotland who made use of the prayers in the liturgy of the Church of England. No worth and no diligence on the part of individuals, however, can atone for or make up the defects of a wretched system; on the contrary, they often render these defects more apparent, and their consequences more pernicious. Few parishes in Scotland were filled in the manner that Salton was. Ignorant and profane persons had almost everywhere, through political interest, thrust themselves into the cure of souls, which, of course, they totally neglected, to the great offence of good men like Burnet, who drew up a memorial of the many abuses he observed among his brethren, which was highly resented by his superiors. In consequence of this, lest his conduct might be attributed to ambitious views, he sequestered himself almost entirely from the public, and by hard study and too abstemious living, threw himself into a fever, which had nearly proved fatal. He was soon after interrupted in his pious labours, by being called upon, by the new administration that was appointed in 1668, in which his friend Sir Robert Murray had a principal share, to give his advice for remedying the public disorders, which had been occasioned by the overthrow of the Presbyterian constitution, and, along with it, the civil rights of the people. At his suggestion the expedient of an indulgence to the Presbyterians, under certain limitations, was adopted in the year 1669, by which it was hoped they would by degrees be brought to submit to the new order of things. He was at the same time employed to assist Leighton, now made Archbishop of Glasgow, in bringing forward his scheme for an accommodation between the conflicting churches. In the course of his journeyings to the west, he was introduced to Anne, Duchess of Hamilton, a very excellent woman, with a strong bias towards the Presbyterians, which enabled her to influence in some degree the leaders of that body, and rendered her somewhat of a public character. At her house the managers of the college of Glasgow had occasion to meet with the minister of Salton, and, the divinity chair being then vacant, he was unanimously elected to fill it. All this was unknown to Burnet till it was over, and he was again thrown into much difficulty, his friends insisting

upon him to accept the invitation, and his parishioners that he should refuse it. Leighton, however, laid his commands upon him, which he considered as law, and he therefore removed to Glasgow in the year 1669.

Owing to the deplorable state of the church and nation, he encountered much trouble and many inconveniences in his new situation. His principal care, however, was to improve his pupils, to whom he seems to have devoted almost his whole time and attention. On the Mondays he made each of the students in his turn explain a head of divinity in Latin and propound a thesis from it, which he was to defend against his fellow-students, the professor concluding the exercise by deciding the point in a Latin oration. On Tuesdays he lectured in Latin, purposing in eight years to embrace a complete system of divinity. On Wednesdays he gave a lecture of an hour upon the Gospel of Matthew. On Thursdays the exercise was alternate: one Thursday he expounded a Hebrew psalm, comparing it with the Septuagint, the Vulgate, and the English version; on the other he explained some portion of the ritual and constitution of the primitive church. On Fridays he made each of his pupils, in course, preach a short sermon upon a text assigned, upon which he gave his own remarks in conclusion. This was the labour of the mornings. In the evenings, after prayers, he every day read them a portion of the Scriptures, on which he made a short discourse, after which he examined into the progress of their several studies, exhorting, encouraging, and directing them, as he found necessary. In order to keep up all these exercises, he was under the necessity of rising every morning at four o'clock, and it was ten before his preparations were completed for the labours of the day. During his vacations he made frequent visits to Hamilton, where he was engaged by the duchess to examine and put in order the papers of her father and uncle, which led him to compile the *Memoirs of the Dukes of Hamilton*. The Duke of Lauderdale hearing he was employed upon this work, wrote for him to come up to London, promising him such information concerning the transactions of these times as he could furnish. He went to London, accordingly, and was received by Lauderdale with much kindness. But the impious manners of this nobleman were not agreeable to him; and he made no use of the confidence reposed in him, except to reconcile his grace to the Duke of Hamilton, who had assignments given him on the revenues of the crown, in satisfaction of some old claims for which vouchers had been found by Burnet among the papers intrusted to his care; and in return the Duke of Hamilton engaged to concur with the measures of the court in the ensuing parliament.

Four of the Scottish bishoprics were at this time vacant, of which Burnet was offered his choice; but he foresaw that they would entangle him in difficulties, with little prospect of his being able to effect anything good; so he utterly refused to accept any of them. In 1672 he prevented a breach between Lauderdale and the Duke of Hamilton, for which his country certainly owed him little thanks. About this time he published his vindication of the authority, constitution, and laws of the church and state of Scotland, wherein he strenuously maintained the cause of Episcopacy, and the illegality of resistance merely on account of religion. This was by the court reckoned a most acceptable service. He was again courted to accept of a bishopric, with the promise of the first archbishopric that should become vacant; but he still persisted in refusing. In 1673 he went again to London, in order to obtain a license

¹ As minister of Salton, Burnet received in stipend from the laird of Salton, in 1665, £397, 10s. Scots (equal to £33, 2s. 6d. sterling), together with 11 bolls, 2 pecks, 2 lippies of wheat; 11 bolls, 2 pecks, 2 lippies, of bear; and 22 bolls, 1 firiot, 1 peck, 3 lippies, meal.—*Receipt, MSS. Adv. Lib.* signed "GILBERT BURNETT."

for publishing his *Memoirs of the Dukes of Hamilton*. He also entertained a resolution to have nothing further to do with the affairs of state, being satisfied that Popery was now the prevailing interest at court, and that the sacramental test by which York, Clifford, and other Papists, had been excluded, was a mere artifice of Charles to obtain money to prosecute the Dutch war. On this occasion he used much freedom both with the Duke and Duchess of Lauderdale, pointing out to them in strong terms the errors they had fallen into, and the fatal effects that would accrue to themselves and to the whole nation. This, with his known intimacy with Duke Hamilton, who was at the time a kind of feeble oppositioist, brought him into high credit, as possessed of great influence in Scotland, in consequence of which he was frequently consulted both by the king and the Duke of York, to the latter of whom he introduced Dr. Stillingfleet, and proposed a conference, in presence of his royal highness, with some of the Catholic priests, on the chief points of controversy between the Romanists and the Protestants, which must have been highly offensive to that bigoted prince. With the king he made no other use of the freedom allowed him than to attempt awakening him out of that lethargy of indolence and vice in which he seemed to be wholly entranced, and to revive in him some sense of religion—an aim in which his self-esteem must have been very strong if he had any hopes of succeeding. The king made him a compliment, however, by naming him one of his chaplains. Having obtained a license for his *Memoirs of the Dukes of Hamilton*, which was delayed that the king and some of his ministers might have the pleasure of reading them in MS., he returned to Scotland, and finding the animosity between the dukes of Lauderdale and Hamilton no longer repressible, he retired to his station at Glasgow. The favour shown him at London awakened the jealousy and exposed him to the rage of a numerous class of courtiers. The schemes of the court having been in some instances thwarted by the parliament, Lauderdale threw the whole blame upon Burnet, whom he represented as the underhand instrument of all the opposition he had met with. This accusation drew him again to court in 1674. The king received him coldly, and ordered his name to be struck off the list of chaplains. Yet, at the entreaty of the Duke of York, his majesty admitted him to an audience, to say what he could in his own defence, which having heard, he seemed satisfied, and ordered him home to Glasgow. From this the Duke of York dissuaded him till his peace should be entirely made; otherwise, he assured him, he could be thrown into prison, where he might be detained as long as the present party was in power. His royal highness at the same time exerted himself to have him reconciled with Lauderdale, but without effect. Dr. Burnet had now no alternative but to resign his professorial chair, and seek a settlement in England, or by going back to Scotland, put himself in the power of his enemies. He did not long hesitate, and would have found at once a quiet settlement in London, had not the electors of the church he had in view been deterred from choosing him by a sharp message from the king. This, though at the time it had the aspect of a misfortune, he ever after spoke of as one of the happiest incidents of his life, as it at once set him free from the entanglements of a corrupt court, whose services he had been so far engaged in, that, without some such accident, he might never have escaped from them.

He had now an offer of the living of St. Giles' Cripplegate, from the dean and chapter of St. Paul's. As he, however, had learned that it was originally

their intention to bestow the living upon Dr. Fuller, afterwards Bishop of Gloucester, he thanked them for the offer, but declared himself not at liberty to accept it. Through the recommendation of Lord Hollis he was next year appointed preacher to a chapel by Sir Harbottle Grimston, master of the rolls, though the court sent first a bishop, and afterwards Secretary Williamson, to inform Harbottle that he was a preacher highly unacceptable to the king. In this chapel he remained nine years, during which time he was elected a lecturer at St. Clement's, and was one of the most admired preachers in town. In 1676 he printed an account of a conference which himself and Dr. Stillingfleet held with Coleman and the principal of the Romish priests; and in 1679 appeared the first volume of his *History of the Reformation*, which procured him a vote of thanks from both houses of parliament, with a request that he would prosecute the work to its completion, without loss of time. Two years after this he published the second volume, which met with the same general approbation as the first. Having at this time no parochial cure, Dr. Burnet was not in the practice of visiting the sick as a part of his regular calling; but he was always ready to attend those who requested his visits. Among these happened to be a lady who had been criminally connected with John Wilmot, Earl of Rochester; and the manner in which the doctor conducted himself towards her excited a strong desire in his lordship to see and converse with him. This led to a weekly meeting of Dr. Burnet and Lord Rochester for a whole winter, which ended first in the conviction, and latterly, it is to be hoped, the conversion of that singular libertine. An account of the whole affair was published by Dr. Burnet in 1681, which, Dr. Johnson says, "the critic ought to read for its elegance, the philosopher for its arguments, and the saint for its piety." During the time of the inquiry into the Popish plot Charles seems to have been softened down considerably, and often sent for Dr. Burnet and consulted with him on the state of the nation. His majesty made also another attempt to bring him over by offering him the bishopric of Chichester, at that time vacant, provided he would come entirely into his interests. Burnet, with an honesty that we fear is but too seldom practised, told the king he knew the oaths that in such a case he must take: these he would observe religiously, but must be excused from giving any other engagements. He of course was not installed in the bishopric; but he embraced the opportunity of writing a letter to the king, which does him more real honour than if he had held in his single person all the bishoprics in England. This letter, so full, so free, so faithful, and so affectionate, we regret that our limits forbid us to insert. We must also leave it to general history to detail the endeavours he made to save the lives of Staley and the Lord Stafford on the occasion of the Popish plot. By his conduct with regard to the exclusion of the Duke of York, and the scheme of a prince regent in lieu of that exclusion, he lost the favour of both parties, perhaps not undeservedly. Yet, in 1682, when the administration was wholly in favour of the Duke of York, a promise was obtained from the king to bestow upon him the mastership of the Temple, which was likely to be immediately vacant; upon which he was again sent for by the king, and treated with extraordinary kindness. Burnet himself, however, waived the promise that had been made him when he found that he was expected, in return for the place, to break up correspondence with all those who had been his best friends. He felt himself at this time upon such dangerous ground, that he was afraid of all communica-

tion with either of the parties that at this time were agitating the public mind; and as an excuse for privacy, built a laboratory, and for a whole year amused himself with performing experiments in chemistry. He was at this time offered a living of £300 a year by the Earl of Essex, upon condition that he would continue to reside in London. In case of having the cure of souls, however, Burnet thought residence with them an indispensable obligation, and the benefice was given to another. In 1683 he narrowly escaped being brought by his friends into trouble about the Kyehouse plot; and by his conducting the trial and attending on Lord William Russel in prison and on the scaffold, and particularly by defending his memory before the council, he incurred the odium of the court, which, from a certain knowledge of his integrity, could not fail at this time to be greatly afraid of him. In the course of this year, probably to be out of the way of his enemies, he went over to Paris, where he was treated with great deference, by the express orders of Louis XIV. Here his friends, apprehensive of danger to him at home, wished him to remain; but as no consideration could induce him to be long absent from his charge, he of course returned in a short time. That same year, however, he was discharged from his lecture at St. Clement's by a mandate from the king, and in March, 1684, he was forbad to preach any more in the chapel at the Rolls. Being thus happily disengaged from all his employments at the death of Charles II., upon the accession of James VII. he requested and obtained leave to quit the kingdom, and went to Paris, where he lived in great retirement, to avoid being involved in the conspiracies which the Duke of Monmouth and the Earl of Argyle were then forming against the government. When that business was at an end, he, in company with an officer, a Protestant in the French service, made the tour of Italy, and in 1684 came to Utrecht, where he found letters from some of the principal ministers of state at the Hague, requesting him to wait upon the Prince and Princess of Orange. As the revolution in England was already in contemplation, Dr. Burnet met from these personages a most gracious reception, and was soon admitted to an entire confidence. When Dyckvelt was sent over ambassador to England, with a view particularly to sound the inclinations of the people, his secret instructions were drawn up by Dr. Burnet, of which the rough draught in his own handwriting is still preserved. James, in the meantime, was highly incensed against him for the reflections he had made on the riciness of the Catholic countries through which he had passed, in an account of his travels recently published, which, it was supposed, had had a sensible effect upon the people of England. His majesty accordingly wrote two severe letters against him to the Princess of Orange, and forbade his envoy at the Hague to transact any business with that court till Dr. Burnet was forbidden to appear there. This, to humour James, was done; but Hallewyn, Fogel, and the rest of the Dutch ministers consulted with him privately every day. A prosecution for treason was now commenced against Dr. Burnet in Scotland; but before this could be notified to the States, he had been naturalized with a view to his marriage with a Dutch lady; and in a letter in answer to the charges preferred against him, directed to the Earl of Middleton, he stated that being now naturalized in Holland, his allegiance, during his stay there, was transferred from his majesty to the States. This expression was at once laid hold of, and dropping the former prosecution, they proceeded against him for these words, as guilty of high treason,

and passed against him a sentence of outlawry. It was then demanded of the States to deliver him up, or to banish him; but as he had been naturalized, the States refused to proceed against him unless he were legally convicted of some crime, which, if his majesty found himself capable of doing, they would punish him according to their law. To narrate the important part he performed in the revolution would be to write the history of that great event. By the Prince of Orange, as well as by the friends of liberty in England, he was treated with unreserved confidence. He had a principal hand in drawing up the prince's declarations as well as the other public papers written at the time to justify the undertaking. But for a particular account of these we must refer our readers to the history of England. At the revolution, Dr. Crew, Bishop of Durham, having been on the high commission created by King James, offered to resign his bishopric to Dr. Burnet, trusting to his generosity for one thousand a year for life out of the episcopal revenue, and sent the Earl of Montague to the Prince of Orange with the proposal; but when mentioned to Burnet, he refused absolutely to have anything to do with it on these terms, as he considered them highly criminal. He was shortly after promoted to the see of Salisbury. At the close of the session of parliament, 1689, Dr. Burnet went down to his diocese, when he entered upon the duties of his episcopal office with that conscientious ardour which distinguished his character. His first pastoral letter, however, in which, to save betraying the discrepancies of his political creed, he founded King William's right to the throne upon conquest, gave so much offence to both houses of parliament, that they ordered it to be burned by the hands of the hangman. He maintained, nevertheless, unshaken credit with King William and Queen Mary to the end of their days, and employed that credit in the most praiseworthy manner. He was by the king, in preference to all his ministers, appointed to name the Princess Sophia Electress of Brunswick, next in succession to the Princess of Denmark, and her issue, in the famous bill for declaring the rights and liberties of the subject, and settling the succession to the crown; and when that succession was explicitly established in 1701, he had the honour of being chairman of the committee to which the bill was referred. He had also the pleasure, in 1690, of being a successful advocate for Lord Clarendon, who had engaged in a plot against the king, and been one of the doctor's bitterest enemies, at the time when Popery and arbitrary power were in favour.

During the life of Mary, Dr. Burnet being generally one of her advisers, the affairs of the church passed wholly through his hands. After her death, in 1694, a commission was granted for that purpose to the two archbishops and four prelates, of whom Dr. Burnet was one. A commission of the same kind was granted in 1700, and the doctor still continued a member. In 1698 he was appointed preceptor to the Duke of Gloucester, and, on that occasion, insisted on giving up his bishopric. King William, however, would not allow him to do so; but, in order to soothe him, made arrangements that he might be at hand, and still have it in his power to pay considerable attention to his diocese. In this high trust the bishop conducted himself so as to have the entire approbation of the Princess of Denmark, who ever after retained a peculiar affection for him, of which he had many sensible tokens after she came to the throne, though in her last years he was in direct and open opposition to her measures. In the year 1699 he published his celebrated *Exposition of the Thirty-nine Articles*, and a short time before his

death a third volume of his *History of the Reformation*. In the month of March, 1715, he was attacked with a pleuritic fever, which carried him off, being in the seventy-second year of his age. He was married first to the Lady Margaret Kennedy, daughter to the Earl of Cassillis, celebrated for her beauty and her wit. Secondly, to Mrs. Mary Scott, a Dutch lady of noble extraction and large fortune, by whom he had three sons. Thirdly, to Mrs. Berkeley, a widow lady of singular talents and uncommon piety, by whom he had no issue.

From the brief sketch which we have given of the principal events of his life, it is evident that Dr. Burnet possessed a vigorous understanding, and was a man of great piety and unwearied perseverance. Early prepossessions, however, which, vigorous as his understanding was, he evidently could not overcome, made him the dupe of a system antisciptural and superstitious—a system which, whatever it may seem to promise in theory, has in practice been found cumbersome and inefficient—a system which, while it provides for a few of the privileged orders of the clergy, leaves all the rest, together with the great body of the people, to want, contempt, and ignorance. What man as a bishop could do, Dr. Burnet, while Bishop of Salisbury, appears to have done; but he was hampered on all hands by insurmountable abuses, originally inherent, or growing naturally out of the legalized order of things. His consistorial court he found to have become a grievance, both to clergy and laity, and he attended for years in person to correct it. But the true foundation of complaint he found to be the dilatory course of proceedings, and the exorbitant fees, which he had no authority to correct. He could not even discharge poor suitors who were oppressed with vexatious prosecutions otherwise than by paying their fees out of his own pocket, which he frequently did, and this was all the reform he was able to accomplish. In admitting to orders, he met with so much ignorance and thoughtless levity, that, for the benefit of the church, he formed a nursery at Salisbury, under his own eye, for students of divinity, to the number of ten, to each of whom he allowed a sum of money out of his own income for his subsistence, and in this way he reared up several young men who became eminent in the church; but this was soon discovered to be a designed affront put upon the method of education followed at Oxford, and he was compelled to give it up. Pluralities he exclaimed against as sacrilegious robbery; and in his first visitation at Salisbury quoted St. Bernard, who, being consulted by a priest whether he might not accept of two benefices, replied, "And how will you be able to serve them?" "I intend," said the priest, "to officiate in one of them by deputy?" "Will your deputy be damned for you too?" said the saint; "believe me, you may serve your cure by proxy, but you must be damned in person." This quotation so affected one of his hearers, Mr. Kilsey, that he resigned the rectory of Bemerton, worth £200 a year, which he held along with one still greater value. The bishop was, at the same time, from the poverty of the living, frequently under the necessity of joining two of them together to have them served at all, and sometimes he found it necessary to help the incumbent out of his own pocket into the bargain. These, with other evils, it must be admitted, the doctor lost no opportunity to attempt having redressed, but alas! they were and are inherent in the system. He travelled over his diocese, which he found "ignorant to scandal," catechizing and confirming with the zeal of an apostle; and when he attended his duty in parliament, he preached in some of the London

churches every Sabbath morning, and in the evening lectured in his own house, where a number of persons of distinction attended. So much conscientious diligence, confined to a legitimate locality, could scarcely have failed to produce a rich harvest of gospel fruits. Scattered as it was over such a wide surface, there is reason to fear that it was in a great measure unprofitable.

While Dr. Burnet was a diligent instructor from the pulpit, he was not less so from the press, having published in his lifetime fifty-eight single sermons, thirteen treatises or tracts on divinity, seventeen upon Popery, twenty-six political and miscellaneous, and twenty-four historical and biographical, to which we may add *The History of His Own Time*, published since his death. Some of these, particularly the *Exposition of the Thirty-nine Articles*, the *History of the Reformation*, and of his own times, still are, and must long continue to be, especially the latter, standard works. *The History of His Own Time*, it has been happily observed, has received the best testimony to its worth from its having given equal offence to the bigoted and interested of all parties. Take him all in all, perhaps no juster eulogium has been passed upon him than that of Wodrow, who, speaking of him as one of Leighton's preachers, calls him "Mr. Gilbert Burnet, well known to the world since first professor of divinity at Glasgow, and after that persecuted for his appearing against Popery, and for the cause of liberty, and since the Revolution the learned and moderate Bishop of Sarum, one of the great eyesores of the high-fliers and Tories of England, and a very great ornament to his native country."

BURNET, JAMES, better known by his judicial designation of Lord Monboddo, was born at Monboddo, in Kincardineshire, in the year 1714. He was eldest surviving son of James Burnet, by Elizabeth Forbes, only sister to Sir Arthur Forbes of Craigievar, Baronet. For what reason is not known, instead of being sent to a public school, he was educated at home, under the care of Dr. Francis Skene, afterwards professor of philosophy at the Marischal College, Aberdeen. This gentleman discharged his duty to his pupil with the utmost faithfulness, and succeeded in inspiring him with a taste for ancient literature. He was the first that introduced him to an acquaintance with the philosophy of the ancients, of which Mr. Burnet became so enthusiastic an admirer. Dr. Skene, being promoted to a professorship, was the more immediate cause of his pupil accompanying him to Aberdeen, and of his being educated at the Marischal College in that city. It is probable that he lodged with his preceptor, who of course would direct and superintend his studies. Dr. Skene was a professor in that seminary for the long period of forty-one years, and was universally acknowledged to be one of the most diligent and laborious teachers that ever held the honourable office.

What contributed, in a great degree, to fix Mr. Burnet's attention upon the literature and philosophy of the Greeks, was not only the instructions he had received at home from his tutor, but that, when he entered the university, Principal Blackwell had for several years been professor of Greek. This person was the great means of reviving the study of this noble language in the north of Scotland; and one of his greatest admirers and zealous imitators in the prosecution of Grecian learning was Mr. Burnet. Esteeming the philosophical works transmitted to us by the Romans as only copies, or borrowed from the Greeks, he determined to have recourse to the

fountainhead. Burnet was naturally a man of very keen passions, of an independent tone of thinking, and whatever opinion he once espoused, he was neither ashamed nor afraid to avow it openly. He dreaded no consequences, neither did he regard the opinions of others. If he had the authority of Plato or Aristotle, he was quite satisfied, and, how paradoxical soever the sentiment might be, or contrary to what was popular or generally received, he did not in the least regard. Revolutions of various kinds were beginning to be introduced into the schools; but these he either neglected or despised. The Newtonian philosophy in particular had begun to attract attention, and public lecturers upon its leading doctrines had been established in almost all the British universities; but their very novelty was a sufficient reason for his neglecting them. The laws by which the material world is regulated were considered by him as of vastly inferior importance to what regarded *mind*, and its diversified operations. To the contemplation of the latter, therefore, his chief study was directed.

Having been early designed for the Scottish bar, he wisely resolved to lay a good foundation, and to suffer nothing to interfere with what was now to be the main business of his life. To obtain eminence in the profession of the law depends less upon contingencies than in any of the other learned professions. Wealth, splendid connections, and circumstances merely casual, have brought forward many physicians and divines, who had nothing else to recommend them. But though these may be excellent subsidiaries, they are not sufficient of themselves to constitute a distinguished lawyer. Besides good natural abilities, the most severe application, and uncommon diligence in the acquisition of extensive legal knowledge, are absolutely necessary. At every step the neophyte is obliged to make trial of his strength with his opponents, and as the public are seldom in a mistake for any length of time, where their interests are materially concerned, his station is very soon fixed. The intimate connection that subsists between the civil or Roman law, and the law of Scotland, is well known. The one is founded upon the other. According to the custom of Scotland at that time, Burnet repaired to Holland, where the best masters in this study were then settled. At the university of Groningen he remained for three years, assiduously attending the lectures on the civil law. He then returned to his native country so perfectly accomplished as a civilian, that, during the course of a long life, his opinions on difficult points of this law were highly respected.

He happened to arrive in Edinburgh from Holland on the night of Porteous's mob. His lodgings were in the Lawnmarket, in the vicinity of the Tolbooth, and hearing a great noise in the street, from a motive of curiosity he sallied forth to witness the scene. Some person, however, had recognized him, and it was currently reported that he was one of the ring-leaders. He was likely to have been put to some trouble on this account, had he not been able to prove that he had just arrived from abroad, and therefore could know nothing of what was in agitation. He was wont to relate with great spirit the circumstances that attended this singular transaction.

In 1737 he became a member of the Faculty of Advocates, and in process of time came into considerable practice. His chief patrons in early life were Lord Justice-Clerk Milton, Lord-President Forbes, and Erskine Lord Tinwald or Alva. The last had been a professor in the university of Edinburgh, and being an excellent Greek scholar, knew how to estimate his talents.

During the rebellion of 1745, Burnet went to London, and prudently declining to take any part in the politics of that troublous period, he spent the time chiefly in the company and conversation of his literary friends. Among these were Thomson the poet, Lord Littleton, and Dr. Armstrong. When peace was restored, he returned to Scotland. About 1760 he married a beautiful and accomplished lady, Miss Farquharson, a relation of Marischal Keith, by whom he had a son and two daughters. What first brought him into very prominent notice, was the share he had in conducting the celebrated Douglas' cause. No question ever came before a court of law which interested the public to a greater degree. In Scotland it became in a manner a national question, for the whole country was divided, and ranged on one side or the other. Mr. Burnet was counsel for Mr. Douglas, and went thence to France to assist in leading the proof taken there. This he was well qualified to do, for, during his studies in Holland, he had acquired the practice of speaking the French language with great facility. Such interest did this cause excite, that the pleadings before the Court of Session lasted thirty-one days, and the most eminent lawyers were engaged. It is a curious historical fact, that almost all the lawyers on both sides were afterwards raised to the bench. Mr. Burnet was, in 1764, made sheriff of his native county, and on the 12th February, 1767, through the interest of the Duke of Queensberry, lord justice-general, he succeeded Lord Milton as a lord of session, under the title of Lord Momboddo. It is said that he refused a jusciciary gown, being unwilling that his studies should be interrupted during the vacation by any additional engagements.

The first work which he published was on *The Origin and Progress of Language*. The first volume appeared in 1771, the second in 1773, and the third in 1776. This treatise attracted a great deal of attention on account of the singularity of some of the doctrines which it advanced. In the first part, he gives a very learned, elaborate, and abstruse account of the origin of ideas, according to the metaphysics of Plato and the commentators on Aristotle, philosophers to whose writings and theories he was devotedly attached. He then treats of the origin of human society and of language, which he considers as a human invention, without paying the least regard to the scriptural accounts. He represents men as having originally been, and who continued for many ages to be, no better than beasts, and indeed in many respects worse; as destitute of speech, of reason, of conscience, of social affection, and of everything that can confer dignity upon a creature, and possessed of nothing but external sense and memory, and a capacity of improvement. The system is not a new one, being borrowed from Lucretius, of whose account of it Horace gives an exact abridgment in these lines:—*Cum prope serunt primis animalia terris, mutum et turpe pecus,* &c., which Lord Momboddo takes for his motto, and which, he said, comprehended in miniature the whole history of man. In regard to facts that make for his system he is amazingly credulous, but blind and sceptical in regard to everything of an opposite tendency. He asserts with the utmost gravity and confidence, that the orang-outangs are of the human species—that in the Bay of Bengal there exists a nation of human creatures with tails, discovered 130 years before by a Swedish skipper—that the beavers and sea-cats are social and political animals, though man, by nature, is neither social nor political, nor even rational—reason, reflection, a sense of right and wrong, society, policy, and even thought, being, in the human species, as much the effects of art, contrivance, and long experi-

ence, as writing, ship-building, or any other manufacture. Notwithstanding that the work contains these and many other strange and whimsical opinions, yet it discovers great acuteness of remark.

His greatest work, which he called *Ancient Metaphysics*, consists of three volumes 4to, the last of which was published only a few weeks before the author's death. It may be considered as an exposition and defence of the Grecian philosophy, in opposition to the philosophical system of Sir Isaac Newton, and the scepticism of modern metaphysicians, particularly Mr. David Hume. His opinions upon many points coincide with those of Mr. Harris, the author of *Hermes*, who was his intimate friend, and of whom he was a great admirer. He never seems to have understood, nor to have entered into, the spirit of the Newtonian philosophy; and, as to Mr. Hume, he, without any disguise, accuses him of atheism, and reprobrates in the most severe terms some of his opinions.

In domestic circumstances Monboddo was particularly unfortunate. His wife, a very beautiful woman, died in child-bed. His son, a promising boy, in whose education he took great delight, was likewise snatched from his affections by a premature death; and his second daughter, in personal loveliness one of the first women of the age, was cut off by consumption when only twenty-five years old. Burns, in an address to Edinburgh, thus celebrates the beauty and excellence of Miss Burnet:—

"Thy daughters bright thy walks adorn,
Gay as the gilded summer sky,
Sweet as the dewy milk-white thorn,
Dear as the raptur'd thrill of joy!

"Fair Burnet strikes the adoring eye,
Heaven's beauties on my fancy shine;
I see the *Sire of love* on high,
And own his work indeed divine."

His eldest daughter was married to Kirkpatrick Williamson, Esq., keeper of the outer house rolls, who had been clerk to his lordship, and was eminent as a Greek scholar.

About 1780, he first began to make an annual journey to London, which he continued for a good many years, indeed, till he was upwards of eighty years of age. As a coach was not a vehicle in use among the ancients, he determined never to enter and be seated in what he termed a box. He esteemed it as degrading to the dignity of human nature to be dragged at the tails of horses instead of being mounted on their backs. In his journeys between Edinburgh and London he therefore rode on horseback, attended by a single servant. On his last visit, he was taken ill on the road, and it was with difficulty that Sir Hector Monroe prevailed upon him to come into his carriage. He set out, however, next day on horseback, and arrived safe in Edinburgh by slow journeys.

Lord Monboddo, being in London in 1785, visited the King's Bench, when some part of the fixtures of the place giving way, a great scatter took place among the lawyers, and the very judges themselves rushed towards the door. Monboddo, somewhat near-sighted, and rather dull of hearing, sat still, and was the only man who did so. Being asked why he had not bestirred himself to avoid the ruin, he coolly answered, that he "thought it was an annual ceremony, with which, being an alien, he had nothing to do."

When in the country he generally dressed in the style of a plain farmer; and lived among his tenants with the utmost familiarity, and treated them with great kindness. He used much the exercises of walking in the open air and of riding. He had

accustomed himself to the use of the cold bath in all seasons, and amid every severity of the weather. It is said that he even made use of the air-bath, or occasionally walking about for some minutes naked in a room filled with fresh and cool air. In imitation of the ancients, the practice of *anointing* was not forgotten. The lotion he used was not the oil of the ancients, but a saponaceous liquid compound of rose-water, olive-oil, saline aromatic spirit, and Venice soap, which, when well mixed, resembles cream. This he applied at bedtime, before a large fire, after coming from the warm bath.

This learned and ingenious, though somewhat eccentric, man died upon the 26th May, 1799, at the advanced age of eighty-five years.

BURNET, JAMES, landscape painter. Among the lives of eminent men it often happens that some individual obtains a place, more on account of the excellence he indicated than that which he realized; and whom a premature death extinguishes, just when a well-spent youth of high promise has commenced those labours by which the hopes he excited would in all likelihood be fulfilled. Such examples we do not willingly let die, and this must form our chief apology for the introduction of a short memoir of James Burnet. He was of a family that came originally from Aberdeen, and was born at Musselburgh, in the year 1788. His father, George Burnet, of whom he was the fourth son, held the important office of general surveyor of excise in Scotland; his mother, Anne Cruikshank, was sister to the distinguished anatomist whose name is so honourably associated with the professional studies of John Hunter. James Burnet soon evinced his natural bias towards art, not only by juvenile attempts in drawing, but his frequent visits to the studio of Scott, the landscape engraver, with whom his brother John, afterwards so eminent as an engraver, was a pupil. On account of these indications, James was placed under the care of Liddel, to learn the mystery of wood-carving, at that time in high request, and productive of great profit to those who excelled in it; and as skill in drawing was necessary for acquiring proficiency in this kind of delineation, he was also sent to the Trustees' Academy, where he studied under Graham, the early preceptor of the most distinguished of our modern Scottish artists. It was not wonderful that, thus circumstanced, James Burnet's taste for carving in wood was soon superseded by the higher departments of art. He quickly perceived the superiority of a well-finished delineation upon canvas or paper over the stiff cherubs, scrolls, and wreaths that were laboriously chiselled upon side-boards and bed-posts, and chose his vocation accordingly: he would be an artist. With this view, he transmitted to his brother John, who was now employed as an engraver in London, several specimens of his drawings, expressing also his earnest desire to commence life as a painter in the great metropolis; and without waiting for an answer, he followed his application in person, and arrived in London in 1810. A letter of acquiescence from his brother, which his hurry had anticipated, was already on the way to Edinburgh, and therefore his arrival in London, although so sudden and unexpected, was not unwelcome.

It required no long stay in the British capital to convince the young aspirant that he had much yet to learn before he could become an artist. But he also found that London could offer such lessons as Edinburgh had been unable to furnish. This conviction first struck him on seeing Wilkie's "Blind Fiddler," of which his brother John was executing the well-known

and justly-admired engraving. James was arrested and riveted by the painting, so unlike all he had hitherto admired and copied: it was, he perceived, in some such spirit as this that he must select from nature, and imitate it, if he would succeed in his daring enterprise. This conviction was further confirmed by studying the productions of the eminent Dutch masters in the British gallery, where he found that originality of conception was not only intimately blended with the truthfulness of nature, but made subservient to its authority. He must therefore study nature herself where she was best to be found—among the fields, and beneath the clear skies, where the beauty of form and the richness of colour presented their infinite variety to the artist's choice, and taught him the best modes of arranging them upon the canvas. Forth he accordingly went, with nothing but his note-book and pencil; and among the fields, in the neighbourhood of London, he marked with an observant eye the various objects that most struck his fancy, and made short sketches of these, to be afterwards amplified into paintings. It was remarked, also, in this collection of hasty pencillings, that instead of seeking to aggrandize the works of nature, he faithfully copied them as he found them. "He has introduced," says a judicious critic, speaking of one of his paintings, "everything that could in any way characterize the scene. The rainbow in the sky, the glittering of the rain upon the leaves; the dripping poultry under the hedge, the reflections of the cattle on the road, and the girl with the gown over her shoulders, all tend with equal force to illustrate his subject." Not content, also, with the mere work of sketching in the fields, he was accustomed to note down in his book such observations in connection with the sketch as might be available for the future picture, or those remarks in reference to light and shade that were applicable to painting in general. The result of this training was soon perceptible in the increasing excellence of his successive productions, of which Allan Cunningham, his biographer, well remarks:—"His trees are finely grouped; his cows are all beautiful; they have the sense to know where the sweetest grass grows; his milk-maids have an air of natural elegance about them, and his cow-boys are not without grace."

Of the paintings of James Burnet, some of which are in the possession of his relatives, and others among the costly picture galleries of our nobility, the following is a list:—1. Cattle going out in the Morning. 2. Cattle returning Home in a Shower. 3. Key of the Byre. 4. Crossing the Brook. 5. Cow-boys and Cattle. 6. Breaking the Ice. 7. Milking. 8. Crossing the Bridge. 9. Inside of a Cow-house. 10. Going to Market. 11. Cattle by a Pool in Summer. 12. Boy with Cows.

While Burnet was thus pursuing a course of self-education that drew him onward step by step in improvement, and promised to conduct him to a very high rank among pastoral and landscape painters, a malady had latterly attended him in his wanderings, that too often selects the young and the sensitive for its victims. This was consumption, a disease which his lonely habits and sedentary employment in the open air were only too apt to aggravate; and, although a change of scene and atmosphere was tried by his removal to Lee in Kent, it was soon evident that his days were numbered. Even then, however, when scarcely able to walk, he was to be found lingering among the beautiful scenery of Lee and Lewisham, with his pencil and note-book in hand, and to the last he talked with his friends about painting, and the landscapes that he still hoped to delineate. He died on the 27th July, 1816. His

dying wish was to be buried in the village church of Lee, in whose picturesque churchyard he had so often wandered and mused during the last days of his illness; but as sepulture in that privileged place could not be granted to a stranger, his remains were interred in the churchyard of Lewisham. At his death he had only reached his twenty-eighth year.

BURNS, ALLAN. This talented anatomist and surgical writer, in whom a life of high promise was too soon arrested, was the son of the Rev. Dr. Burns, minister of the Barony Church, Glasgow; a venerable clergyman, who, after bearing for several years the title of "father of the Church of Scotland," on account of his seniority, died in 1839, at the very advanced age of ninety-six. Allan Burns was born at Glasgow on the 18th September, 1781. When not more than fourteen years old, he entered the medical classes, where his diligence and proficiency were so remarkable, that only two years afterwards, he was able to undertake the entire direction of the dissecting-rooms of Mr. John Burns, his brother, who at that time was a lecturer on anatomy and surgery in the city of Glasgow. In this situation, his opportunities of extending and perfecting his knowledge were so carefully employed, that he attained, even though still a youth, a high reputation among the practical anatomists of his day. His views being directed to medical practice in the army, he went to London, in 1804, for the purpose of obtaining a commission; but before his application was made to that effect, he received an offer that altered his intention. It was to repair to St. Petersburg, and undertake the charge of an hospital which the empress Catherine was desirous of establishing in her capital, upon the English plan. Allan Burns had been recommended to her majesty by Dr. Creighton, as one every way qualified for this important charge; and when the offer was made, it was with the understanding that he might make a six months' trial before finally closing with it. Tempted by so alluring a prospect, Burns left London for St. Petersburg, and commenced the duties of his new career. But Russia was not at that time the country which it has now become, and the sensitive mind of the young Scot was soon sickened by the Asiatic pomp and Scythian barbarism with which he was surrounded. On this account, he abandoned the tempting prospects of court favour and professional advancement that were held out to him, and returned to Scotland before the six months of probation had ended. At his departure, he was presented by the empress with a valuable diamond ring, as a token of the royal approbation and esteem.

On returning to his native country, which was at the commencement of 1805, Burns resolved to occupy the place of his brother, who had discontinued his lectures on surgery and anatomy. This he did in the winter of the following year, and quickly won the admiration of his pupils, by the correctness and extent of his professional knowledge, and great power of illustration. Indeed, as a lecturer, the most abstruse subjects in his hands became plain and palpable, and the driest subjects full of interest. Still, however, notwithstanding his reputation as a lecturer, his fame would have been limited and evanescent, had it not been for the works he published, by which the high admiration of those who knew him was participated in by the world at large. The first of these publications, which appeared in 1809, was entitled *Observations on some of the most Frequent and Important Diseases of the Heart: or Aneurism of the Thoracic Aorta; or Preternatural Pulsation in the Epigastric Region; and*

on the Unusual Origin and Distribution of some of the Large Arteries of the Human Body; illustrated by cases. The second, which was published in 1812, was entitled *Observations on the Surgical Anatomy of the Head and Neck*; illustrated by cases. This was the whole amount of his authorship, with the exception of two essays, which he contributed to the *Edinburgh Medical and Surgical Journal*; one on the anatomy of the parts concerned in the operation for crural hernia; the other on the operation of lithotomy. The career of professional distinction which these works had so favourably opened up to him, was closed before it could be further pursued. So early as 1810 his health had begun to give way, and though he continued to lecture for two years afterwards, it was with great difficulty and pain. His death occurred on the 22d of June, 1813.

BURNS, JOHN, M.D., a distinguished medical writer, and elder brother of Allan, the subject of the preceding notice, was born in Glasgow, in 1774. He was descended from a family of the name of *Burn*; his grandfather, John Burn, was a teacher of English in Glasgow, and the author of an English grammar bearing his name, a work highly popular as a school-book in the west of Scotland about a century ago. His father was the Rev. John Burns, D.D., who, as has been already mentioned, was minister for upwards of sixty-nine years of the Barony parish of Glasgow, and who died in 1839. John, who was the eldest surviving son of Dr. Burns, was born in 1775. He began his professional studies in Glasgow, and continued them in Edinburgh. He had just completed his studies when the Glasgow Royal Infirmary, in which he was the first surgeon's clerk, was opened for the reception of patients in 1792. His favourite department of medical science was surgical anatomy, in which he made remarkable progress. He soon began to give instructions to others, and was the first private teacher of anatomy in Glasgow. His lecture-room was originally at the head of Virginia Street, at the north-west corner, behind the present Union Bank. At that period, and for thirty years afterwards, subjects for dissection could only be obtained by violating the repose of the dead; a practice most demoralizing to those immediately engaged in it, and not infrequently productive of unpleasant consequences to lecturers and students. An affair of this nature having transpired in connection with the lecture-room of Mr. Burns, proceedings were instituted against him by the authorities, but were quashed on his coming under a promise to discontinue his lectures on anatomy. His younger brother Allan, however, took up the anatomical lectures, and John began to lecture on midwifery. The lecture-room of the brothers was removed to a tenement built on the site of the old bridewell, on the north side of College Street. They were both successful as lecturers. Allan's style was monotonous and unpleasing, but his demonstrations were admirable. John's manner was the more agreeable, his knowledge was exact, his views were practical, and his lectures were interspersed with anecdotes and strokes of humour which rendered them highly attractive to the students. Dr. Burns now began to exhibit the fruits of his studies in a series of important contributions to the literature of his profession. His first publication of note was the *Anatomy of the Gravid Uterus*, which appeared in 1799. This was followed, in 1800, by two volumes on *Inflammation*, in which he was the first to describe a species of cancer which is now known by the name of *fungus hæmatodes*. These two works stamped their author as an observing, original, and

practical inquirer. They were followed by *Observations on Abortion*, in 1806; *Observations on Uterine Hæmorrhage*, in 1807; and by the most popular of all his medical writings, *The Principles of Midwifery*, in 1809, a book which has been translated into various languages, and has passed through numerous editions. In 1828-38 appeared the *Principles of Surgery*, in two volumes, a work which cost Dr. Burns much pains, but did not meet with corresponding success. He likewise published a popular work on the *Treatment of Women and Children*.

Dr. Burns married, in 1801, the daughter of the Rev. John Duncan, minister of the parish of Alva, in Stirlingshire. He continued to lecture on midwifery till 1815, when the crown instituted a regius professorship of surgery, in the university of Glasgow, to which chair he was appointed, and discharged its duties till the close of his life. In 1810 his wife died, and he remained a widower during the forty years that he survived her. By her he had four children: the youngest, Allan, named after his uncle, was born in January, 1810.

At an early period in his professional career, Dr. Burns became surgeon to the Royal Infirmary, and distinguished himself by the nerve with which he operated. He subsequently became the partner of Mr. Muir, and, after that gentleman's death, of Mr. Alexander Dunlop, a connection which brought him into excellent family practice. His son, Allan, followed the medical profession, and having completed his studies, after a residence of three years on the Continent, he commenced practice in 1832. With an intimate knowledge of medical science, and a strong love of anatomical pursuits, he was rising fast into eminence, when intermittent fever, caught in the prosecution of his duties, carried him off after a short illness, in November, 1843, in the thirty-fourth year of his age. It was not till his son entered upon public practice that the subject of this memoir took out his degree, which he had previously refused to do. He was shortly afterwards elected physician to the Royal Infirmary. He had subsequently considerable practice as a consulting physician. Dr. Burns had, however, been gradually retiring from the labours of his profession, when the severe affliction caused by his son's death befell him. He then gave up everything but his professorial duties, devoting much of his time to carrying out the views of the principal and professors of the college as respected the medical school—and, in token of their gratitude, he was requested by the senatus to sit for his portrait, which, having been painted by Mr. John Graham Gilbert, was placed in the Hunterian Museum of the college.

Early in life, and while yet a student in the university of Edinburgh, his mind was imbued with those religious principles which regulated his whole career, and sustained him amidst many afflictive bereavements. To the religious world he became favourably known by a work entitled *The Principles of Christian Philosophy*, which has gone through several editions, and promises to hold a permanent place in religious literature.

Dr. Burns also published another religious book, entitled *Christian Fragments*. Although brought up in the Church of Scotland, of which he was an elder, he became a member of the Episcopalian church, and died in its communion. His end was sudden and melancholy. He perished in the wreck of the *Orion* steamboat, on her passage from Liverpool to Glasgow, on the 18th of June, 1850. Having finished his course and kept the faith, he was removed from the world in the attitude and exercise of prayer. He had reached the mature age of seventy-five.

ROBERT BURNES.

Dr. John Burns was F.R.S., and a member of the Institute of France, and of several other scientific institutions in various countries. In politics he was a staunch Conservative. He was of a cheerful disposition, was a great favourite with his patients, and towards his professional brethren he behaved on all occasions in the most honourable manner. In person he was under the middle height, with gray flowing locks, and his dress was scrupulously neat and antique. Few individuals in Glasgow were unacquainted with his exterior, and thousands who knew little of his professional attainments were yet familiar with his appearance as a venerable medical gentleman of the old school. His eldest and only surviving son, Lieutenant-colonel Burns, of the second queen's regiment, died at the Cape of Good Hope towards the close of 1853.

BURNS, ROBERT. This illustrious bard, the poet of Scotland, and not only of Scotland, but of nature at large, was the son of William Burnes, of whose origin all that is known is, that his father had been a farmer in the Mearns, on the domains of the earl marischal, and that he left his native district at the age of nineteen. William Burnes (for thus he spelled his name) first repaired to the neighbourhood of Edinburgh, where he wrought as a gardener for several years; afterwards migrated to Ayrshire, where he became overseer on a small estate, and rented a few acres of land; and finally, in 1757, married Agnes Brown, an Ayrshire girl, of the same humble rank as his own. It has been suspected that William's father as well as himself had been of the same Jacobite sentiments as their landlord, and had even been involved in the rebellions of 1715 and 1745, on which account William had found it necessary to leave his home and commence life anew among strangers. If this was the case, we can understand the sympathy of the poet for the Stuart cause when Jacobitism had become useless, and was even branded as ridiculous. But William Burnes possessed a character of his own which would have procured him respect whatever were his political leanings. His superior education was attested by his command of the English language, which he spoke more fluently and correctly than most people of his own degree. His integrity and manly independence were equally felt by his employers and those who worked under him. And in the family circle, where he was best understood, every member of it was enlightened by his conversation, directed by his judgment, and awed by his reproof. It is enough to add, that in the religious duties of the household he unconsciously sat for the picture of the father in the "Cottar's Saturday Night."

Of this upright noble-minded peasant Robert Burns was the son. In worldly circumstances the birth of the poet was unpromising, for it was in a little cottage of the humblest description in the parish of Alloway, a mile and a half from the town of Ayr, and in the immediate neighbourhood of the bridge of Doon—a clay-built cottage, which William Burnes had erected with his own hands. But this edifice is now the chief mark of many a pilgrimage to Scotland from lands however remote. Here the future bard, who was to fill the world with his fame, was born on the 25th of January, 1759. In his sixth year Robert was sent to school at Alloway Milne, about a mile distant; but the teacher having got a better situation a few months afterwards, another was engaged in his stead by William Burnes and a few other cottagers, who paid the cost of teaching by boarding the preceptor in their houses by turns. By this plan, which was common in

many of the rural districts of Scotland even until the close of the last century, several students supported themselves as teachers during their training for the clerical profession, while education of a superior kind was insured to the most secluded localities and children of the humblest ranks. Here Robert and his younger brother Gilbert remained so long as to learn to read English tolerably and to write a little; and here also Robert learned the rules and application of English grammar, which had afterwards an improving influence both upon his writings and conversation. As books in such a locality were not very numerous, while the mind of the young poet was ravenous for its intellectual sustenance, he devoured everything in print that fell in his way, and still hungered for more. It was well, perhaps, that he was not distracted by that immense variety and abundance of books which, in our own day, makes the task of reading such a careless and superficial process: on the contrary, every page was heedfully conned over until the whole volume was absorbed into his intellectual existence, and became a portion of his growth and strength. In this process of self-improvement, the first work he read was the *Life of Hannibal*, next to Hector of Troy the darling hero of young schoolboys. When he was a few years older, the *Life of Sir William Wallace*, in verse, by Henry the Minstrel, but modernized by Hamilton of Gilbertfield, came in his way, whose exploits were still more wonderful than those of the gallant Carthaginian, as well as more dear to his enthusiastic Scottish heart. Among the list of books perused in his youth, and which he either bought, borrowed, or obtained from book societies, were *Salmon's Geographical Grammar*, *Derham's Physico-Astro-Theology*, *Ray's Wisdom of God in the Creation*, and *Stackhouse's History of the Bible*. Some of these works were sufficient, by their bulk and erudition, to daunt a peasant boy; but to Robert Burns they had no such terrors: "No book!" declares his brother, "was so voluminous as to slacken his industry, or so antiquated as to damp his researches." His zeal for self-improvement was also attested by the following incident:—An uncle of his having gone to purchase in Ayr *The Ready Reckoner*, or *Tradesman's Sure Guide*, bought by mistake *The Complete Letter-writer* in its stead. This was a fortunate blunder for his nephew Robert, whom it inspired with a zeal to excel in letter-writing; and as the collection consisted of letters by the most eminent English writers, he persevered in the study until his own epistolary compositions surpassed the models. The letters of Burns are as wonderful as his poems. When he was about thirteen or fourteen years of age, he advanced to a higher and more miscellaneous kind of reading; and the books of this class are specified as Pope's *Poems*, and Pope's *Homer*, some plays of Shakespeare, *Boyle's Lectures*, *Locke on the Human Understanding*, *Hicely's Meditations*, *Taylor's Scripture Doctrine of Original Sin*, and the works of Allan Ramsay and Smollett. And all these works not only read but mastered by a peasant not advanced beyond the age of boyhood! But the most influential of them all was *A Collection of Songs*. Here he had lighted upon the shining grains on the surface which revealed to him the gold-field in which he was to dig and become rich. "That volume," he says fervently, "was my *cade mecum*. I pored over them, during my work, or walking to labour, song by song, verse by verse, carefully noticing the true, tender, or sublime, from affection or fustian; and I am convinced I owe to this practice most of my critic craft such as it is." In the meantime the rest of his school education had

been going on irregularly and by short snatches, during which he perfected himself in English grammar, learned a very little Latin, to which language he was not partial, and made greater proficiency in French, which he was able to read with tolerable ease.

But while schools and books were thus training the peasant youth for his future high destination, another stern discipline had all the while been at work, the good and evil effects of which would be equally difficult to calculate. The poet's father, notwithstanding his upright character, and more than ordinary abilities, was one of those persons whose talents and worth are equally unavailing in the battle of life; and whose attempts, however wisely devised and carefully followed out, seem as if fore-doomed to end in failure. He took the farm of Mount Oliphant, of between eighty and ninety acres, at what was apparently a very moderate rent, and had a loan of £100 to stock it; but the soil was ungenial, and did not repay him either for labour or outlay. Under these circumstances the family had to submit to privations that were unusual in those days in Scotland, even in the cottages of the poorest; and Robert, only half-fed, was obliged in boyhood to undergo the work of a man. At thirteen he thrashed the crops, with occasional help from Gilbert, his younger brother; and at fifteen he held the plough, while Gilbert drove the team. Such toil and such an unavailing struggle, acting upon a proud indignant spirit, imparted a scorching fire and energy to his poetical temperament, which, under happier circumstances, might never have been kindled: but where in such a case would have been that heroic independence, that withering contempt of the artificial distinctions of society, and those terrible denunciations of oppression and oppressors which form so essential a charm of his poetry? And where would have been those sympathies that were so beautifully expressed for the bird shivering and half-starved in its winter's nest, the field-mouse with its little house destroyed, or even the daisy that lay crushed beneath his ploughshare? But dearly, on the other hand, did he pay for such advantages. "I doubt not," says his brother Gilbert, "but the hard labour and sorrow of this period of his life was in a great measure the cause of that depression of spirits with which Robert was so often afflicted through his whole life afterwards. At this time he was almost constantly afflicted in the evenings with a dull headache, which, at a future period of his life, was exchanged for a palpitation of the heart, and a threatening of fainting and suffocation in his bed, in the night-time." Nor was this the worst. These sufferings and privations of his early youth laid the groundwork of that intemperance with which his after-life was chargeable. It was not wonderful, however deeply to be deplored, that the involuntary sufferings of the ascetic should be exchanged for the fierce indulgences of the bacchanal, and that the latter should be enhanced by the recollections of the former.

But long before this reaction had occurred, and while his mind was still in the purity of boyhood, an event happened, by which his high vocation as the poet of his country was decided. The outburst of a poet's first inspiration is generally patriotism, religion, or love; and, in the case of Robert Burns, it was the last that broke the seal of the fountain, and caused its imprisoned waters to gush forth. His own account of the circumstance is too interesting to be either omitted or curtailed. "You know our country custom," he writes to his English biographer, "of coupling a man and woman together as partners in the labours of harvest. In my fifteenth autumn

my partner was a bewitching creature, a year younger than myself. My scarcity of English denies me the power of doing her justice in that language; but you know the Scottish idiom; she was a *bonnie, sweet, sossie lass*. In short, she altogether, unwittingly to herself, initiated me in that delicious passion, which, in spite of acid disappointment, gin-horse prudence, and book-worm philosophy, I hold to be the first of human joys, our dearest blessing here below. How she caught the contagion I cannot tell; you medical people talk much of infection from breathing the same air, the touch, &c.; but I never expressly said I loved her. Indeed, I did not know myself why I liked so much to loiter behind with her, when returning in the evening from our labours; why the tones of her voice made my heart-strings thrill like an Æolian harp; and particularly why my pulse beat such a furious ratan, when I looked and fingered over her little hand to pick out the cruel nettle-stings and thistles. Among her other love-inspiring qualities, she sung sweetly; and it was her favourite reel to which I attempted giving an embodied vehicle in rhyme. I was not so presumptuous as to imagine that I could make verses like printed ones, composed by men who had Greek and Latin; but my girl sang a song which was said to be composed by a small country laird's son, on one of his father's maids, with whom he was in love; and I saw no reason why I might not rhyme as well as he; for, excepting that he could smear sheep, and cast peats, his father living in the moorlands, he had no more scholarship than myself. Thus with me began love and poetry."

But with this opening of a new and buoyant existence, the old was still hanging to it like a millstone. After residing at the farm of Mount Oliphant for the space of eleven years, toiling with his family like a serf, and meeting with continued loss and disappointment, William Burnes removed to the farm of Lochlea, in the parish of Tarbolton. But the change brought only a fresh train of disasters, so that at the end of seven years the old man succumbed, and died with the prospect of utter bankruptcy and a jail hanging over him. The removal to Lochlea occurred when our poet was only seventeen years of age; but, amidst these depressing circumstances, his native qualities, both moral and intellectual, were developing themselves in all their strength and luxuriance. The first difficulty of a poet, the mechanical art of rhyming, he had already tried and surmounted, and he was now prelude with those attempts which were afterwards to carry him into the highest regions of song. The inspiration, also, that first awoke his muse, instead of abating, became more fervent than ever; and when his first boy-love ceased, it was only to give place to a fresh succession of mistresses, each of whom possessed him wholly for the time, though it might be but for a week or a day. And little did it matter how these goddesses might appear to moral eyes: his fervent imagination was sufficient to form a *Venus de Medicis* out of a very ordinary block of granite. Hence the rustic astonishment that was excited by his lays, which peopled the whole region round about with nymphs of surpassing beauty, whose charms they had never been able to detect; and the fervour of their exclamation, when the originals were pointed out, of "whaur were his cen!" And well would it have been for his moral reputation, if he could have been contented with this poetical idolatry. But the ethereal in such extremes is too closely allied to the sensual; and, in too many cases, Burns found that his goddesses were women, and weak ones too. These aberrations, however, did not occur until several years afterwards; and for the present, the

mind of Burns was involved in a daily struggle arising from the meanness of his condition, and the consciousness of his own latent powers. Speaking of this period of his existence, he says, "The great misfortune of my life was to want an aim. I had felt early some stirrings of emulation; but they were the blind gropings of Homer's Cyclops round the walls of his cave. I saw my father's situation entailed on me perpetual labour. The only two openings by which I could enter the temple of fortune, was the gate of niggardly economy, or the path of little chicaning bargain-making. The first is so contracted an aperture I never could squeeze myself into—the last I always hated—there was contamination in the very entrance! Thus abandoned of aim or view in life, with a strong appetite for sociability, as well from native hilarity as from a pride of observation and remark, a constitutional melancholy or hypochondriasm that made me fly solitude; add to these incentives to social life, my reputation for bookish knowledge, a certain wild logical talent, and a strength of thought, something like the rudiments of good sense; and it will not seem surprising that I was generally a welcome guest where I visited."

When our poet had reached the twenty-third year of his life, to him it was an eventful period. With a worn-out father dying under the near prospect of hegary and a jail, and with the cares of the family, as the eldest of its members, about to devolve upon him, he felt it necessary, instead of following the precarious occupation of farming, to learn a trade. For this purpose he joined a flax-dresser in the neighbouring town of Irvine, at whose occupation he wrought for six months. Here also he established the Batchelor's Club, and drew out its rules and regulations. It originally consisted of seven young men belonging to the parish of Tarbolton, and was to meet on the evening of every fourth Monday to discuss a question on any important subject, disputed points of religion being alone excepted. The place of meeting was a small public-house in the village, and not more than threepence was to be expended by each member in drink. Thus humble though such a society was, and established only by young rustics for their intellectual improvement, their meetings could be of no ordinary kind when they had Robert Burns for their chief speaker. Here also he matured that command of language and power of conversational discussion which afterwards were to astonish the most learned and accomplished of Edinburgh. But there were also other gatherings at Irvine, one of which was fatal to the poet's project of pursuing the occupation of a flax-dresser. He had only resided six months in that town when new year's-day arrived, and such a visit could not at that time occur in Scotland without being welcomed by all ranks with a carousal. A party had been assembled by Burns for this purpose; but while the mirth and fun grew fast and furious, the combustible materials of the shop were accidentally set on fire and the shop itself burned to ashes, leaving their owner, like a true poet, not worth a sixpence.

On the death of old William Burnes, in 1784, the family removed to the farm of Mossiel, in the neighbourhood of Mauchline, of which they had previously taken a sub-lease. It consisted of 118 acres, which they held at a rent of £90; and as it was a joint-stock adventure, each brought to it the portion he had saved from the general wreck. The farm being thus stocked, although in a scanty fashion, each member was to receive victuals and wages from it, the share of wages allotted to

Robert and Gilbert being £7 per annum to each. Upon this limited allowance the poet commenced life in earnest. To use his own words, "I entered on this farm with a full resolution, 'Come, go to, I will be wise!' I read farming books," he continues, "I calculated crops, I attended markets; and in short, in spite of the devil, and the world, and the flesh, I believe I should have been a wise man; but the first year, from unfortunately buying bad seed, the second from a late harvest, we lost half our crops. This overset all my wisdom, and I returned, 'like the dog to his vomit, and the sow that was washed to her wallowing in the mire.'" It is thus that half in mirth, and half in remorseful sorrow, he briefly sums up the history of that commencement by which his success in life was to be made or marred. But while the agriculturist would pity, and the moralist condemn, such an untoward experiment and its result, this sojourn at Mossiel constitutes the most important of all epochs in the history of Scottish poetry. For it was in the "auld clay biggin," dignified with the name of a farmhouse, and when he was resolved to abjure poetry for ever, that he enjoyed the glorious "vision" in which the Scottish muse welcomed him, cheered him onward, and placed the crown of holly on his head. And it was while he was ploughing the cold sterile soil of Mossiel, in the attempt to wring from it a bare subsistence, that he was visited by the best and brightest of his poetical inspirations. Although he could find neither wealth nor competence, he had found where his real strength lay, and was revelling in its enjoyment. While holding the plough some impressive idea would seize him, which he soon resolved into rhyme, and the verses thus formed served as the nucleus of other stanzas which he gathered round it by after study, until the whole poem was completed. His common auditor was his affectionate brother and fellow-labourer Gilbert, to whom he recited these productions, when finished, and by whom a record has been left of the circumstances in which they originated. It is a curious instance of poetical modesty that Burns, while producing such matchless poems, was content with a single hearer; and that while his talents, knowledge, and conversational powers obtained for him the admiration or envy of his companions, they little guessed that a prince of poetry was among them. But so it was, and the two brothers kept well the secret which they shared between them. Gilbert indeed had begun to suspect that such poems were too good to remain unknown; and after imparting this idea to Robert, the latter thought of sending one of them to some magazine. But the idea was not followed out; and perhaps it was better that the whole collection should burst upon the world at once, and take it by storm—as we know it afterwards did.

In the meantime the life of Burns, before he entered into authorship, continued to be a chequered one; it was also one that was evidently fitting him for some remarkable destination, should the course of events be propitious. In reputation for talent he was far beyond his compeers, and they consoled themselves in their inferiority with the thought, that he was but a hare-um scare-um genius after all, who would never get on in the world. His intellectual superiority was even recognized by that of the educated as chanced to meet him in company, and erudite divines preached with a certain nervous uneasiness when Robert Burns was among their hearers. But to this acknowledgment of superiority, there were also joined some serious disqualifications. In theological belief he could scarcely be called

orthodox, and his freedom in religious discussions were already procuring for him the character of being "not sound." His latitudinarian practices in some cases were but too correspondent to the flexibility of his creed, and these especially in matters of chastity and sobriety. He had even been punished for the sin of incontinence according to the rules of Scottish ecclesiastical discipline, by being rebuked in open congregation in the church of Mauchline by the Rev. Mr. Auld, the minister of the parish. Excluded by these circumstances from the rigid or orthodox party, who comprised the bulk of the Scottish population, Burns had no alternative but to ally himself to their opponents, the moderates, who welcomed him as a valuable acquisition; and under their colours he commenced that bitter war against the opposite party which vented itself in poetical sarcasms, such as *The Holy Fair*, *Holy Willie's Prayer*, and other similar productions. And most unjustly were these "priest-skelping turns" recorded against him as proofs of his irreligious spirit, his profanity, and general unbelief, while they were nothing more than the sharp strong utterances of party feeling and theological antagonism. He held up to ridicule the severe doctrines, the precise practices, and high pretensions of the orthodox clergy and their followers; and in this he only retaliated the charges with which they were wont to condemn the moderates. It was nothing more than a war at outrage, as all theological conflicts are wont to be. But Burns had the last word of it, because he had the word that lasts longest—and hence the intensity of their dislikes. The antagonism of the two parties still continues, but the scorching and withering satire of the poet is as fresh as ever. No wonder then that the charge of profanity has been continued against the poet until the present day. Were we to rake up the pamphlets and broad-sheets of this controversy, we should find paragraphs as bitter, and apparently as profane, written by clergymen on both sides of the question, whom the world never thought of accusing of irreligion, and whose memory, when their fight was ended, was allowed to rest in peace.

Among the many charmers who had been successively the objects of Burns's adoration, Jean Armour now reigned paramount. She was of a rank scarcely better than his own, being the daughter of a master-mason, in the village of Mauchline, of which locality she was the reigning belle. Their first meeting was characteristic of their country and station. Burns, while out shooting by the river side, saw a black-eyed, rosy-faced, jimp-waisted lassie about seventeen years of age, washing clothes in the Scottish fashion by tramping them in a tub, and cheering this dancing operation by lilting a Scottish song. His dog ran over a portion of the clothes that were spread out upon the green to dry; she threw a stone at the animal, to drive it away; and Burns sportively remarked, "If you liked me, you would like my dog." This introduction led to a mutual acquaintanceship and fervent liking on both sides, of which the consequences at length became too apparent—the poor girl was about to become a mother. In this dilemma Burns was in no doubt as to what he ought to do: honour and justice required that he should anticipate the consequences by marriage. But his farming speculations had been an utter failure, so that he was obliged to throw up his share of Moss-giel, of which his tenure had been only nominal; and having no home of his own, an immediate marriage was impossible. He did however what he could, by giving her what are called in Scotland "marriage

lines"—a precontract that constitutes a marriage according to law, and legitimates the offspring that would otherwise be branded with shame, independent of the sanctions of the church, which only visits such offenders with rebuke and fine before it notifies the union. With her character thus shielded, Jean was to remain in the paternal home, while her affianced husband was to repair to Jamaica, in the hope of securing such a position as would enable him to maintain a wife and family. But the discovery of her state prematurely occurred, and her father was in a transport of indignation. Even her marriage lines were of no avail, as he thought that his daughter's marriage with a man of such questionable character, and in Jamaica, would be worse than none. He therefore prevailed upon her to destroy the written documents, and abide the consequences of her imprudence. Burns was well-nigh distracted at the change, and offered to stay at home and support his wife and children as he best could, by the wages of a daily labourer; but the old man would not relent; and when Jean Armour became the mother of twins, he sent the sheriff-officers after Burns, to compel him to find security for the support of his children, although well aware that he could not. In this difficulty the poet was obliged to flee to the mountains, until he could muster enough of money to convey him to Jamaica. He had already obtained the promise of a situation there, as an overseer or book-keeper, and for the price of his passage he had been advised to publish a collection of his poems by subscription. To these strange circumstances his immortal productions were indebted for their appearance before the world. Subscription papers were issued, the printing of his little volume was commenced in Kilmarnock, and these labours were alternated with his preparations for the West India voyage. Only 600 copies of this first edition were published, and from the sale Burns had just realized enough for the expenses of his expatriation; his chest had been forwarded by night to Greenock, for fear of an arrest; and he had composed the mournful ditty of *The Gloomy Night is Gathering Fast*, in which he bade farewell to his native district in the following mournful accents:—

"Farewell, old Coila's hills and dales,
Her heathy moors and winding vales,
The scenes where wretched fancy roves,
Pursuing past unhappy loves,
Farewell, my friends! farewell, my foes!
My peace with these—my love with those—
The bursting tears my heart declare,
Farewell, the bonnie banks of Ayr."

But when all was at the darkest the storm was dispersed, the sun broke out, and the whole landscape was gladdened with the singing of birds and the voice of joyful promise. His poems had been read not merely with approbation, but with rapture and astonishment. The little publication was not merely poetry, but poetry of a new kind, or at least the long-lost ancient inspiration recalled to fresh life and utterance. Among the foremost to recognize its excellence were the peasantry, whose simple life and ardent feelings it embodied in their own despised dialect; and while they read, they wondered at the poetical richness of their native Doric, and the genius of him who had invested it with a power and attractiveness hitherto unfelt. And rapidly these feelings continued to widen until all classes were pervaded with their influence. *The great national poet* had appeared at last, and in the form of a half-educated ploughman! In the preface to the first edition of his volume, a preface at once characterized by manly independence and modest timidity, Burns had thus characterized his attempt:—"The author certainly looks upon

himself as possessed of some poetic abilities, otherwise his publishing in the manner he has done, would be a manoeuvre below the worst character, which, he hopes, his worst enemy will ever give him. But to the genius of a Ramsay, or the glorious dawns of the poor unfortunate Ferguson, he with equal unaffected sincerity declares, that even in his highest pulse of vanity, he has not the most distant pretensions." This he wrote in that humble spirit of self-appreciation, the characteristic of genius of the highest order, by which Burns was distinguished to the close of his career. But the united voice of the public at once contradicted this lowly estimate, and placed him far above the level of Ferguson and Ramsay. "When," it was asked, "had these poets written anything to be compared to *The Cottar's Saturday Night*, *Halloween*, or *Tam O' Shanter*?"

But while the poet's fame was growing with such rapidity, something more immediate in its action was necessary to save him from ruin or exile. Still "the gloomy night was gathering fast," and relief delayed until to-morrow might come too late. He had successfully eluded the pursuit of his angry father-in-law; his luggage was on board at Greenock, and at the price of nine guineas he had secured a steerage passage to Jamaica, where, on landing, he would either be cut off by yellow fever, or committed to the unpoetical duties of a negro-driver. And what, under either alternative, would his genius, or the renown he was winning, avail him? At such a crisis relief appeared in the form of a blind old man. This was Dr. Blacklock; and honoured be the man that saved Burns to Scotland and the world at large! A copy of the poems of Burns had been sent to him, and their effect upon him was electric. Himself a poet, he recognized in them poetry of the very highest character; and, as free from envy as pure-hearted childhood, he was impatient to announce his admiration, and benefit the author. He wrote a letter so full of encouragement, and inviting Burns so cordially to try his fortune in the metropolis, that the poet renounced his purpose of the Jamaica voyage before it was too late. "I posted," he says, "away to Edinburgh without a single acquaintance, or a single letter of introduction. The baneful star that had so long shed its blasting influence on my zenith, for once made a revolution to the nadir."

It was in November, 1786, that Burns for the first time entered the Scottish capital, as if he had come into a new world. He might have appeared and walked among its throngs without notice, and passed away unremembered, for his outward form was not such as to separate him from the crowd. All that met the common view was a strongly-built peasant in his best clothes, with a dark physiognomy, and such a stoop as is generally acquired by hard-working bodily labour, and no one at first sight would have thought that this was the Apollo of Scottish poetry. It was only in company, and in the glow of conversation, that his homely countenance was lighted into eloquence, and his large black deep-set eyes were more powerful than words. But as such distinctive advantages could only be recognized upon acquaintanceship, it was as well for Burns that, though he carried no letters of introduction, he was not unknown to Edinburgh. The first week or two he resided chiefly with Ayrshire acquaintances in a state of obscurity; but his productions in the meantime were preparing the way for him, and bespeaking a cordial welcome. Already he was known by fame among some of the highest literary characters in Edinburgh. A critique which appeared in the *Lounger*, giving "An Account of Robert Burns, the Ayrshire Ploughman, with Extracts from his Poems,"

VOL. I.

from the elegant pen of the author of the *Man of Feeling*, had not only wafted his reputation over Scotland, but had carried it into England. These were introduction enough, and as soon as it was known that he was in Edinburgh, all classes were eager to see him, and be admitted into his company. Besides Dr. Blacklock, he could soon enrol among his personal acquaintances, the Earl of Glencairn, Professor Dugald Stewart, Principal Robertson the historian, Dr. Blair the eloquent divine, Dr. Gregory, Frazer Tytler, and the greatest northern celebrities of the day. It was a different society from that of Mauchline and Tarbolton; but Burns was equal to the occasion, and his conversational powers, instead of lessening, only deepened the impression which his poetical genius had created. His appearance, demeanour, and bearing in such distinguished companies are well described by one who was afterwards to enjoy an intellectual reputation more varied, and but a little lower than his own. Among Sir Walter Scott's interesting reminiscences of Burns are the following:—"As for Burns, I may truly say, '*Virgilium vidi tantum*.' I was a lad of fifteen in 1786-7, when he came first to Edinburgh, but had sense and feeling enough to be much interested in his poetry, and would have given the world to know him; but I had very little acquaintance with any literary people, and still less with the gentry of the west country, the two sets that he most frequented. . . . As it was, I saw him one day at the late venerable Professor Henderson's, where there were several gentlemen of literary reputation, among whom I remember the celebrated Dugald Stewart. Of course we youngsters sat silent, looked and listened. The only thing I remember which was remarkable in Burns's manner was the effect produced upon him by a print of Banbury's, representing a soldier lying dead on the snow, his dog sitting in misery on the one side, and on the other his widow with a child in her arms. These lines were written beneath:—

"Cold on Canadian hills, or Minden's plain,
Perhaps that parent wept her soldier slain;
Bent o'er her babe, her eye dissolved in dew,
The big drops mingling with the milk he drew,
Gave the sad presage of his future years,
The child of misery baptized in tears."

Burns seemed much affected by the print, or rather the ideas which it suggested to his mind. He actually shed tears. He asked whose the lines were, but it chanced that nobody but myself remembered that they occur in a half-forgotten poem of Langhorne's, called by the unpromising title of the *Justice of the Peace*. I whispered my information to a friend present, who mentioned it to Burns, who rewarded me with a look and a word, which, though of mere civility, I then received, and still recollect, with very great pleasure."

The great delineator of Scotland and its people then proceeds to the portraiture of the national poet:—"His person was strong and robust; his manners rustic, not clownish; a sort of dignified plainness and simplicity, which received part of its effect perhaps from one's knowledge of his extraordinary talents. . . . I would have taken the poet, had I not known what he was, for a very sagacious farmer of the old Scottish school—i.e. none of your modern agriculturists, who keep labourers for their drudgery, but the *douce gude* man who held his own plough. There was a strong expression of sense and shrewdness in all his lineaments; the eye alone, I think, indicated the poetical character and temperament. It was large, and of a dark cast, and glowed (I say literally *glowed*) when he spoke with feeling or interest. I never saw such another eye

in a human head, though I have seen the most distinguished men in my time. His conversation expressed perfect self-confidence, without the slightest presumption. Among the men who were the most learned of their time and country, he expressed himself with perfect firmness, but without the least intrusive forwardness; and when he differed in opinion, he did not hesitate to express it firmly, yet at the same time with modesty."

Mention has been made of Dugald Stewart as among the distinguished characters with whom Burns associated in Edinburgh, and to the eye of the eminent and accomplished philosopher the rustic bard was a subject of intense psychological interest. As he also associated frequently with Burns, and was better qualified by matured years and the nature of his studies to obtain a more complete insight into the poet's mind than Sir Walter could enjoy from his single interview, his account gives features and colouring to the picture which the former could only sketch in outline. We select from it the following extract, as it is too long to be given in detail:—

"His manners were then, as they continued ever afterwards, simple, manly, and independent; strongly expressive of conscious genius and worth; but without anything that indicated forwardness, arrogance, or vanity. He took his share in conversation, and not more than belonged to him; and listened with apparent attention and deference on subjects where his want of education deprived him of the means of information. If there had been a little more of gentleness and accommodation in his temper, he would, I think, have been still more interesting; but he had been accustomed to give law in the circle of his ordinary acquaintance, and his dread of anything approaching to meanness or servility rendered his manner somewhat decided and hard. Nothing, perhaps, was more remarkable among his various attainments, than the fluency, and precision, and originality of his language, when he spoke in company; more particularly as he aimed at purity in his turn of expression, and avoided more successfully than most Scotchmen the peculiarities of Scottish phraseology. . . . The attentions he received during his stay in town from all ranks and descriptions of persons, were such as would have turned any head but his own. I cannot say that I could perceive any unfavourable effect which they left on his mind. He retained the same simplicity of manners and appearance which had struck me so forcibly when I first saw him in the country; nor did he seem to feel any additional self-importance from the number and rank of his new acquaintance. . . . He had a very strong sense of religion, and expressed deep regret at the levity with which he had heard it treated occasionally in some convivial meetings which he frequented. . . . I do not recollect whether it appears or not from any of your letters to me, that ever you had seen Burns. If you have, it is superfluous for me to add, that the idea which his conversation conveyed of the powers of his mind exceeded, if possible, that which is suggested by his writings. Among the poets whom I have happened to know, I have been struck in more than one instance with the unaccountable disparity between their general talents and the occasional inspirations of their more favoured moments. But all the faculties of Burns's mind were, as far as I could judge, equally vigorous; and his predilection for poetry was rather the result of his own enthusiastic and impassioned temper than of a genius exclusively adapted to that species of composition. From his conversation I should have pronounced him to be fitted to excel in whatever walk of ambition he had chosen

to exert his abilities. . . . I must not omit to mention, what I have always considered as characteristic in a high degree of true genius, the extreme facility and good nature of his taste in judging of the compositions of others, where there was any real ground for praise. I repeated to him many passages of English poetry with which he was unacquainted, and have more than once witnessed the tears of admiration and rapture with which he heard them. In judging of prose, I do not think his taste was equally sound. . . . The influence of this taste is very perceptible in his own prose compositions, although their great and various excellencies render some of them scarcely less objects of wonder than his poetical performances. The late Dr. Robertson used to say, that, considering his education, the former seemed to him the more extraordinary of the two."

Such was Burns as he appeared for the first time before the highest intellects of Edinburgh; and it will be seen, that while they recognized the wonderful talents and many-sided intellect of the Ayrshire ploughman, it was with the homage that is due to a superior genius. By a single stride he had stepped from obscurity to an intellectual throne, while none disputed his right to occupy it. And this was at a time too when there were giants in the land—men so eminent in every intellectual department that this period might be called the Augustan era of Scotland. Every circle was eager to fete him, and Burns was the honoured guest of every evening party of rank and genius in the northern capital. But more wonderful still than this sudden elevation, was the equanimity with which he sustained it, so that after he had passed through the ordeal, he retained the same estimate of himself and of others as before: such incense had neither impaired his intellect, nor corrupted his heart. And well would it have been for him had he in like manner escaped the other contagions with which he was surrounded. But with all its intellectual reputation, Edinburgh had not yet thrown aside the besetting vice of the national character, and at this time it enjoyed the unenviable distinction of being one of the most hard-drinking cities in Europe. Affairs of business in every department were usually conducted in taverns, and no evening party, however select, was complete without an immoderate amount of drinking from which the most abstinent could not wholly escape. In such a state of things, to remain uncontaminated would have been little less than miraculous, more especially when the previous life of Burns, and his fervid temperament, are taken into account. His whole existence had been one of such difficulties and privations as seldom fall even to the lot of the peasantry, and his course had hitherto been one of habitual abstinent sobriety, although checkered with a few instances of social excess among the smugglers of the coast of Carrick, or the rustics of Mauchline and Tarbolton. But to find himself suddenly elevated into the circles of rank, beauty, and fashion, and playing a high part in the festive conversations of the learned, the witty, and the eloquent, was too much for humanity, or at least the portion which had fallen to his share; the allurements of the moment overmastered him; and while he went *pari passu* with such attractive companions, it was into paths that charmed him by their novelty, and with a zest that made his return all the more difficult. Thus the habit was formed which clouded his after-life, and which the most enthusiastic of his admirers are compelled to acknowledge and deplore.

In coming to Edinburgh, one important object of

Burns was to publish his poems anew; accordingly a second edition was published by Creech early in March, 1787; and as nearly 3000 copies were quickly sold, his reputation was not only more widely diffused than ever, but such a sum realized as enabled him to support his expenses in Edinburgh, and afterwards to undertake a tour over some of the most interesting portions of his native country, and parts of the English border. At his return, the greater part of the winter of 1787-8 was spent in Edinburgh, where he was received with as hearty a welcome, and involved in the same dissipation, as before. But it was time that he should now settle down into the occupations of his future life, and for this he was provided with the means, as on settling with his publisher Creech, in February, 1788, he found himself possessed of the clear sum of £500. He returned to his family, but no longer the same person who had left it; for he was not only rich according to peasant estimation, but had achieved an illustrious reputation, and associated with the most distinguished men of the land. One of his first acts was to advance £200 to his brother Gilbert, who was still struggling with difficulties on the farm of Mossiel; with the remainder of his capital, and other profits that were still accruing from the sale of his poems, he rented the farm of Ellisland on the banks of the Nith, six miles above Dumfries, and entered into occupation on Whitsunday, 1788. He had previously applied to the board of excise, and been put on the list for the office of exciseman, and this profession he intended to combine with that of a farmer. His next step was to marry Jean Armour, his betrothed wife, who had twice made him the father of twins, although only one of the four children she had borne to him now survived. In such a union there was no longer any difficulty with her parents, who were now as eager to have him for their son-in-law as they had formerly been averse to it. On thus entering into a regular married life, nothing could be more heroic than the resolutions he formed to avoid his former deviations, and commence in earnest a steady, industrious, virtuous career. These resolutions he thus expressed in his common-place book, on Sunday the 14th of June, 1788:—"This is now the third day that I have been in this country. 'Lord, what is man!' What a bustling little bundle of passions, appetites, ideas, and fancies; and what a capricious kind of existence he has here! . . . I am such a coward in life, so tired of the service, that I would almost at any time, with Milton's Adam, gladly lay me in my mother's lap, and be at peace. But a wife and children bind me to struggle with the stream, till some sudden squall shall overset the silly vessel, or, in the listless return of years, its own craziness reduce it to a wreck. Farewell now to those giddy follies, those varnished vices, which, though half sanctified by the bewitching levity of wit and humour, are at best but trifling idling with the precious current of existence; nay, often poisoning the whole, that, like the plains of Jericho, the water is naught and the ground barren, and nothing short of a supernaturally gifted Elisha can ever after heal the evils."

Thus repentant of the past, and resolute upon a course of amendment, Burns resumed the simple life of a farmer on settling at Ellisland. But a whole array of obstacles was opposed to the purposed reformation. The luxuries of rich men's tables had indisposed him for the simple peasant fare of his former lowly condition. The varied and exciting life he had led since the first publication of his poems had unfitted him for the plodding and persevering industry without which the work of farming cannot

be successfully carried on. And more than all were the bacchanalian indulgences in which he had revelled among the societies of the learned and distinguished in Edinburgh, and which he was now willing to repeat, although with diminished lustre, among the bonnet-lairds and farmers of Dumfriesshire. Every tourist, also, who visited Scotland, thought his task incomplete without enjoying an interview with its great poet; and such interviews it was impossible to hold without what were considered the due rites of hospitality. Against these strong temptations he continued to battle, and with such partial success, that his constitution was as yet unbroken; and although the allurements of social excess were generally too much for him, he had not as yet fallen into the habitual use of ardent spirits. Under these circumstances, there was still hope of recovery, and that a better course of life was awaiting him, when his transition from a farmer to a ganger decided the momentous question. His application to the board of excise had been successful, and he had been appointed exciseman of his district with a humble salary of £50 per annum. He felt the degradation of the office, of which he thus wrote in one of his letters, "I am now a poor rascally gauger, condemned to gallop two hundred miles every week, to inspect dirty ponds and yeasty barrels." But this continual travelling, and variety of scene and action, he found more attractive than monotonous occupation in the narrow limits of Ellisland; so that while the work of the farm was left to servants, who might waste or mismanage at pleasure, his days were chiefly spent on horseback, and in a chase after smugglers among the hills and dales of Nithsdale. Such explorations also were calculated to confirm his irregular habits, and throw him into society the least distinguished for temperance and regularity. His farming speculations proving a failure—as how could they otherwise in such circumstances?—he, at the end of three years and a half, abandoned Ellisland, and at the close of 1791 removed with his family to a small house in the town of Dumfries, having been appointed exciseman to a new district, the emoluments of which were about £70 per annum. It was there, alas! that his irregularities grew into confirmed habits, which finally hurried him into an untimely grave. Of this period of his life the following account, given by Heron in his *Life of Burns*, is too fully borne out by general testimony to be contradicted:—"In Dumfries his dissipation became still more deeply habitual. He was here exposed more than in the country, to be solicited to share the riot of the dissolute and the idle. Foolish young men, such as writers' apprentices, young surgeons, merchants' clerks, and his brother excisemen, flocked eagerly about him, and from time to time pressed him to drink with them, that they might enjoy his wicked wit. The Caledonian Club, too, and the Dumfries and Galloway Hunt, had occasional meetings at Dumfries after Burns came to reside there, and the poet was of course invited to share their hospitality, and hesitated not to accept the invitation. The morals of the town were, in consequence of its becoming so much the scene of public amusement, not a little corrupted, and, though a husband and a father, Burns did not escape suffering by the general contamination, in a manner which I forbear to describe. In the intervals between his different fits of intemperance, he suffered the keenest anguish of remorse and horribly afflictive foresight. His Jean behaved with a degree of maternal and conjugal tenderness and prudence, which made him feel more bitterly the

evils of his misconduct, though they could not reclaim him."

Amidst this desperate struggle between his better resolutions and his trespasses, in which every lapse was seen in its true light only when too late, and followed by the unavailing tortures of self-reproach and resolutions of reformation that proved equally unavailing, Burns had not abandoned the high vocation by which he was set apart from other men. At Ellisland, indeed, it appears from his letters, that he wrote little poetry, and for this the nature of his position may sufficiently account. He had commenced the important work of life in earnest, the every-day realities of which were scarcely favourable to poetical idealism; and after what he had already achieved, he might repose for a while upon his laurels. But in 1792 a call was made upon his muse to which he could not be inattentive. In that year Mr. George Thomson, clerk of the honourable board of trustees in Edinburgh, and distinguished as a musical amateur, projected a work entitled "*A Select Collection of Original Scottish Airs for the Voice*:" to which are added, Introductory and Concluding Symphonies and Accompaniments for the Piano Forte and Violin, by Pleyel and Korleuck, with Select and Characteristic Verses by the most admired Scottish Poets." It was a patriotic enterprise as well as a labour of love on the part of Mr. Thomson, who, far from rich, was yet willing to peril all that he had on a costly publication by which the song-music of his country was to be preserved. But without the aid and co-operation of Burns, how could such a purpose be fulfilled? It was natural that the editor should apply to the author of the *Cottar's Saturday Night*, and he invoked him, "for the honour of Caledonia," to take up the pen, and write twenty or twenty-five songs suited to the particular melodies which was prepared to send him—hinting, at the same time, a reasonable pecuniary remuneration. Burns was already a large contributor to *Johnson's Musical Museum*, but no sooner did Mr. Thomson's application arrive than he returned a cordial assent. He was ready to reform the old national songs, as well as to write new ones. But the idea of payment for his contributions he peremptorily and indignantly rejected. "As to any remuneration," he wrote, "you may think my songs either above or below price; for they shall absolutely be the one or the other. In the honest enthusiasm with which I embark in your undertaking, to talk of money, wages, fee, hire, &c., would be downright prostitution of soul! A proof of each of the songs that I compose or amend, I shall receive as a favour." And this from a man with a wife and family, and only twenty pounds a year! But poetry, in his eyes, was too sacred a commodity to be sold; and so long as he was free from a jail or absolute starvation, he would give it cheerfully and without price. The result was, that instead of twenty or twenty-five songs, the number originally specified, he contributed to Thomson's collection 150, of which more than one half were wholly original, and the rest either improvements of old verses, or verses of his own which had previously appeared in *Johnson's Museum*. And could such songs be written by an author with the fumes of strong drink in his head, or whose delicacy of genius and strength of intellect a course of habitual intemperance had impaired? Do they not rather prove that the excesses of the poet while he lived in Dumfries have been overdrawn, and that his aberrations, however culpable, were rather occasional than habitual?

But however partial his lapses may have been, they were now to be visited with their natural retribution. The early hypochondriacal tendencies of his

constitution had admonished him of the dangers of intemperance in vain, and the temporary cure which he sought in stimulants and exciting society had confirmed the disease beyond remedy. More than a year before his death, there was a decline in his personal appearance, and from October, 1795, to the January following a severe rheumatism confined him to the house. He had scarcely recovered, and was still in a state of debility, when he imprudently joined a party at a tavern dinner, where the merriment was kept up till about three in the morning. The weather was severe, and Burns, who was intoxicated, is said to have fallen asleep upon the snow in his way home. On the following morning his rheumatism returned upon him with redoubled violence, and after languishing under it till the middle of summer, he repaired to Brow in Annandale, on the shore of the Solway Firth, hoping to effect a recovery by sea-bathing. But he soon felt that his days were numbered. Mrs. Riddell of Glenriddel, a beautiful and accomplished lady, and a friend of the poet, happened at that time to be residing in the neighbourhood, and her interview with him, of which she has left a full account, gives us a distinct idea of the last days of Burns. The stamp of death was on his features, and with that playfulness which is often more expressive of sadness than mirth, he said, on entering the room, "Well, madam, have you any commands for the other world?" In the conversation that followed, he spoke of his approaching death with firmness, but also with feeling, and his principal sorrow was for his four young children who would be left unprotected, and for his wife, who was hourly expected to be delivered of a fifth. He then passed to the subject of his poems, and especially the publication of his posthumous works, and regretted that every scrap he had written would be revived and printed to the injury of his future reputation, when he was no longer at hand to vindicate it. He also regretted the epigrams he had penned on persons against whom he entertained no enmity, and his indifferent poetical pieces, which, after his death, would be thrust upon the world with all their imperfections on their head; and expressed his sorrow for having delayed to put his papers into a proper state of arrangement, as it was now too late. "I have seldom," adds Mrs. Riddell, "seen his mind greater or more collected. There was frequently a considerable degree of vivacity in his sallies, and they would probably have had a greater share, had not the concern and dejection I could not disguise damped the spirit of pleasantry he seemed not unwilling to indulge. We parted about sunset on the evening of that day (the 5th of July, 1795); the next day I saw him again, and we parted to meet no more."

Finding no relief from bathing, and having a fresh attack of fever, Burns on the 18th of July was brought back to Dumfries, but so greatly enfeebled, that he could no longer stand upright. It was known that his case was past all hope, and the town was darkened as with the gloom of a public calamity. His faults and failings were forgot, all ranks and classes united in a common sympathy, and wherever two or three townsmen were assembled in the streets, their talk was of the poet, of his wonderful genius and loveable qualities, and how greatly their town and Scotland at large would be a loser by his departure. Nor was that event long in following, for he died on the 21st of July, the third day after his return home. On the 26th he was buried, and with such obsequies as are not always accorded to the highest rank; for besides the volunteers of Dumfries, the fencible infantry of Angus-shire and the cavalry of the Cinque Ports, then quartered at Dumfries,

who marched at the funeral with their banners and military music, about ten or twelve thousand persons followed them in procession, many of whom had travelled from a great distance to be present at the solemnity. If anything also could deepen such a sorrowful scene, it was an event which at that moment was occurring in the house of mourning, for Mrs. Burns was at the same time delivered of a posthumous son, who died in infancy. Nor did the public sympathy here terminate, for, as the poet died poor, an immediate exertion followed in behalf of his family, for whose support upwards of £700 were collected; and this sum, with the profits of Dr. Currie's *Life and Edition of Burns*, formed such a fund as their father had never possessed while living, and furnished his children with the means of an excellent education that fitted them for the honourable career which was afterwards opened up to them. The less substantial but more public honours to his memory succeeded; the street in which he had lived was thenceforth, by the authority of the magistrates of Dumfries, named Burns Street; a mausoleum to his memory was erected in the churchyard where he lies buried, and another near the Calton Hill, Edinburgh; and a yearly anniversary was established, on which day all who value his writings and revere his worth, in whatever country of both hemispheres, assemble to talk of our national poet, and the benefit which his works have conferred not merely upon Scotland, but upon humanity at large, and for all future time.

The family of Robert Burns by Jean Armour consisted, from first to last, of five sons and four daughters; but all the latter died in early youth, and also two of the former, leaving only three survivors out of such a numerous family. Of these, Robert the eldest, a retired clerk of the accountant-general's department, died at Dumfries; the youngest, Lieut.-col. James Glencairn Burns, of the E. I. C.'s service, died at Cheltenham in 1866; and of the whole family none now survive but William Nicol Burns, also a colonel of the E. I. C., who retired from the service about twenty years ago, at the same time as his brother James, and lived with him at Cheltenham. But no grandson of the poet by the male line is living, his only grandchildren being two females, the daughters of Colonel James. Thus Robert Burns has shared in the mournful distinction reserved for poets only of the highest order—no grandson of his by the male line will found a family that will represent him to future generations. Thus, in common with Shakspeare, Milton, and Scott, he must pay the price for such a lasting name, and renown that will be imperishable. At his death, his partner, "bonnie Jean," was still young, and fully deserving of her title; but true to the memory of her first and only affection, she continued unmarried, and after living honoured and beloved by all who knew her, died in March, 1834, in her seventieth year.

BUTE, EARL OF. See STUART, JAMES.

C.

CALDER, SIR ROBERT, Bart. It has been truly remarked by Hallam, that the state trials of England exhibit the most appalling accumulation of judicial iniquity that can be found in any age or country. And why? Because, as he adds, the monarch cannot wreak his vengeance, or the nobles vent the bitterness of their feuds, except in a law court, and by a legal process. The trials connected with the history of the British navy, and the iniquitous sentences passed upon some of our most heroic and deserving admirals, attest too fully the truth of Hallam's observation. Byng, Matthews, Cochrane—the first shot, the second cashiered, and the third imprisoned, from no adequate cause, or without cause whatever—are cases that seem to carry us back, not to the dark ages, when heroism at least was fairly appreciated, but to the old Carthaginian periods, when the bravest generals were crucified as often as their rivals entered into place and power. A fourth British admiral, who was the victim of an unjust trial and most undeserved punishment, was Sir Robert Calder, the subject of the present notice. And we judge it the more necessary to introduce him with the preceding remarks, as it is only now, after the lapse of many years, that men are disposed to render full justice to his memory and worth.

Robert Calder was the second son of Sir Thomas Calder of Muirton, Morayshire, and was born at Elgin on the 2d of July, 1745. At the age of fourteen he entered the navy as midshipman. At the age of twenty-one he had attained the rank of lieutenant on board the *Essex*, commanded by the Hon. George Falkner, and served on the West India station. Promotion, however, was long in coming, for it was not until after many years that

he obtained the command of a ship. In 1782 he was captain of the *Diana*, which was employed as a repeating-frigate to Rear-admiral Kempenfelt. At this period, also, he was an unwilling sharer in one of those events which the British historian is compelled to record to the shame of our glorious navy. The united fleets of France and Spain had appeared upon our coasts; but Sir Charles Hardy, who commanded the English fleet, was ordered not to risk an engagement, so that he was obliged to retire between the Wolf-rock and the Main. Such an inglorious retreat, at a time when the flag of Rodney was triumphant, so maddened our gallant tars, that they muffled with their hammocks a figure-head of George III., swearing that his majesty should not be witness of their flight. Captain Calder, who belonged to the rear-division, so fully sympathized in their feelings, that, although his vessel was within a short distance of a large French two-decker, that could have blown him out of the water by a single broadside, he kept his place, until he was peremptorily ordered by signal to retire.

On the renewal of war with France, Captain Calder was employed in various services, from which little individual distinction was to be acquired; but in these he acquitted himself so well as to establish his character for naval skill and courage. He was finally appointed captain of the fleet by Sir John Jervis, and was present at the memorable engagement of the 14th of February, 1797, off Cape St. Vincent, when the Spanish fleet of twenty-seven sail of the line and twelve frigates was completely defeated by Jervis, with only fifteen ships and six frigates. On this great occasion, where Nelson and Collingwood were the heroes of the encounter, Captain Calder ac-

quitted himself so ably, that on being sent home with the despatches, he was honoured with knighthood, and afterwards made a baronet. On the 14th of February, 1799, he rose in the service by seniority to the rank of rear-admiral; and in 1801 was sent with a small squadron in chase of Admiral Gantheaume, who was carrying supplies to the French army in Egypt. A short-lived peace followed, and Sir Robert Calder retired to his residence in Hampshire, from which he was quickly recalled to sea by the renewal of hostilities with France; and in 1804 he was raised to the rank of Vice-admiral of the White.

This fresh commencement of war was an event of more than common importance to Great Britain. Its liberty, its very existence as a nation, were now at stake; for Bonaparte, hitherto so successful in all his enterprises, had resolved to invade it, and for this purpose was making preparations at Boulogne commensurate with what he meant to be his crowning enterprise. An immense flotilla was constructed and put in readiness to convey an army of 150,000 veteran soldiers from Boulogne to the shores of Kent, after which, a march upon London was deemed an easy achievement. Still further to insure the facilities of such an invasion, these flat-bottomed transports were ostentatiously armed, as if they alone were intended to force a passage across the British Channel, and thus the attention of our statesmen was withdrawn from the real point where danger was to be apprehended. This consisted in the contemplated junction of the French and Spanish fleets, which was to be effected while the eyes of England were exclusively fixed upon the land show of preparations going on at Boulogne. While these warlike boats were intended for transports, and nothing more, Napoleon's real design was to collect forty or fifty ships of the line in the harbour of Martinique, by operations combined in the harbours of Toulon, Cadiz, Ferrol, and Brest; to bring them suddenly back to Boulogne; and while thus making himself for fifteen days master of the sea, to have his whole army transported into England without interruption.

Never, perhaps, since the days of William the Conqueror, had England been in such imminent jeopardy. While her statesmen were still thrown off their guard, and imagining that the only danger lay in the flotilla, the vessels preparing in the ports of Ferrol, Cadiz, and Carthage consisted of thirty-eight French and thirty Spanish ships of the line; and these, if combined, would have been sufficient to hold the English Channel against all the force which our nation could muster. To attempt a blockade of the hostile harbours was the only expedient that occurred to the British government in this emergency, and the important task of blockading the ports of Ferrol and Corunna was intrusted to Sir Robert Calder. Even yet, however, the design of Bonaparte was so little surmised, that Sir Robert's force on this occasion was utterly incommensurate with the greatness of the crisis, for only seven sail were allowed him, which were afterwards raised to nine; and with these he was to prevent five French ships of the line and three frigates, and five Spanish ships of the line and four frigates, from leaving the hostile harbours. Thus the blockade was to be maintained by a force which was greatly inferior to that of the enemy. Undismayed by this disparity, Sir Robert entered his appointed station, and maintained it, notwithstanding the manœuvres of the Brest squadron to entice him into the open sea.

At length the moment arrived which Bonaparte had anticipated. The imperfect blockades of the British had been in several cases eluded; the West

Indies had been reached by several hostile squadrons; and Nelson, who had gone in pursuit without being able to reach them, only learned at the last moment that the combined French and Spanish fleets had set sail from Martinique, and were in full return to Europe. A swift-sailing vessel, which he sent with this intelligence, happily outstripped the combined fleet, and thus, at the last moment, and by an intervention truly providential, the British government was put upon its guard. The first movement of the enemy, to which they were directed in consequence of the express command of Bonaparte, was to raise the blockade of Ferrol, and that accomplished, to proceed with the French and Spanish ships lying there to the relief of the other ports, by which their whole combined navy would be collected in full force in the English Channel. Sir Robert Calder was thus to abide the first brunt of the onset, and upon the stoutness of his resistance the issue of the great trial between France and England would mainly depend. Conscious of this, the British government despatched instant orders to Rear-admiral Stirling, who commanded a squadron before Rochefort, to raise the blockade of that harbour, join Sir Robert Calder off Ferrol, and cruise with him off Cape Finisterre, to intercept the allied fleet of the enemy on their homeward passage to Brest.

As soon as the junction between the two British squadrons was effected, Sir Robert Calder stood out to sea, and quickly reached the station appointed for his cruise. Although the addition of Stirling's squadron raised his whole force to nothing more than fifteen ships of the line, two frigates, a cutter, and a lugger, he had little fear of the issue, as the French and Spanish fleet was supposed to amount to only sixteen ships. But as soon as the enemy hove in sight, looming through a fog that had concealed their approach until they were close at hand, it was found that they consisted of twenty line-of-battle ships, a fifty gun-ship, seven frigates, and two brigs. This was an unexpected and startling disparity; but Sir Robert boldly entered into action, although the fog that had commenced in the morning made it necessary for his ships, which bore down in two columns, to tack before they reached the enemy. A close action of four hours ensued, in which the British, notwithstanding their inferiority of numbers, behaved with such gallantry and spirit that a signal victory would probably have been the consequence, had it not been for the haze, which became so dense that Sir Robert was scarcely able to see his ships either ahead or astern. As it was, he had already captured two large Spanish ships, the *Rafad* of eighty-four, and the *Firme* of seventy-four guns; and, judging it imprudent to continue the fight, he brought to, for the purpose of covering his prizes, and waiting an opportunity to renew the engagement. On the following day the French and Spanish fleet, having the advantage of the windward, advanced within a league and a half of the British, upon which, Sir Robert, hauling on the wind, offered them battle; but Villeneuve, the admiral of the combined fleet, refused the challenge, by hauling to the wind on the same tack as his adversary. On the third day Sir Robert once more offered battle, but in vain; and, being now justly apprehensive of the union of the enemy with the Rochefort and Ferrol squadrons, under whose combined force his own would have been overwhelmed, he fell back, relying upon the support of the Channel fleet, or that of Lord Nelson; while Villeneuve, instead of holding on in his course, was fain to retire into Ferrol. This meeting, that was fraught with such momentous consequences, occurred in lat. 43° 30' north, and long.

11° 17' west, or about forty leagues from Ferrol, on the 22d of July, 1805.

Nothing could exceed the rage and vexation of Napoleon at this engagement and its result. He saw that, by this single stroke, all his preparations at Boulogne were frustrated, and the projected invasion of England rendered hopeless. As soon as he received the tidings, he summoned Count Daru, his private secretary, into the apartment, who, on entering, found the emperor traversing the room with hurried steps, and exclaiming, "What a navy! What sacrifices for nothing! What an admiral! All hope is gone! That Villeneuve, instead of entering the Channel, has taken refuge in Ferrol! It is all over; he will be blockaded there. Daru, sit down and write." Daru took up his pen accordingly, and, with the rapidity of lightning, Napoleon dictated the details of the breaking up of the army at Boulogne, the routes and movements of the different corps, and all the complicated minutiae of the campaign that ended so triumphantly at Austerlitz. In this manner the terrible storm that was to have gathered and burst over London, was suddenly wafted away to the shores of the Danube and the devoted palaces of Vienna. Speaking of his disappointment in after years, Bonaparte said, "If Admiral Villeneuve, instead of entering into the harbour of Ferrol, had contented himself with joining the Spanish squadron, and instantly made sail for Brest, and joined Admiral Gantheaume, my army would have embarked, and it was all over with England."

While such was the judgment of Napoleon upon this event—and certainly no one was so fitted to foretell its consequences—a very different estimation was made of it in England. There, a long series of naval victories had so pampered the public vanity, that the defeat of a British fleet was deemed impossible, and anything short of its full success a proof of the most culpable negligence and shortcoming. It was the counterpart of that land-delusion which made our countrymen imagine that every Briton was able to beat three Frenchmen, until subsequent events reduced them to a more reasonable calculation. Of this overweening estimate Sir Robert Calder was soon to taste the bitter fruits. He had encountered a fleet, no matter how superior to his own, and not annihilated it; he had allowed it to slip through his fingers, and find shelter in a friendly harbour. In the meantime, the unconscious victim of such unreasonable obloquy was congratulating himself on his services, and anticipating nothing less than the approbation of his country. With an inferior force he had blocked up the enemy in port for nearly five months; he had afterwards encountered and held the combined fleet at bay when their ships greatly outnumbered his own, and made two valuable captures without losing a single vessel. These advantages were so justly appreciated by Lord Cornwallis, his superior in command, that on the 17th of August, 1805, Calder was sent back with twenty ships to Ferrol, from which Villeneuve had ventured out at the express command of Napoleon, to join the French fleet at Brest; but, on hearing of Sir Robert Calder's approach, instead of pursuing his course, he tacked about and made sail for Cadiz, which he reached on the 21st. Thus Calder had the honour of baffling, for the second time, an expedition, upon which the fate of England was at stake; and Villeneuve, shut up in Cadiz, was obliged to remain at anchorage there, until all was ready for the crushing disaster at Trafalgar.

But the same winds that carried Calder against his antagonist, and enabled him once more to baffle the most cherished of Napoleon's objects, also bore

to his ears the murmurs of the admiralty at home, and brought to him the public prints in which his courage as a British sailor, and his loyalty as a British subject, were equally called in question. Indignant at these aspersions, and the eagerness with which they were received, he resolved to right himself by a public trial. He therefore demanded from the lords of the admiralty the sitting of a court-martial upon his conduct, notwithstanding the earnest entreaties of Nelson that he should remain on the station, and await the expected engagement, in which his reputation would be fully cleared. On finding, however, that his brother-admiral was impatient of an hour's delay until his character was vindicated, the hero of the Nile sent him home in the *Prince of Wales*, his own ship of ninety guns, to do Calder the greater honour, although such a diminution from the fleet could be ill spared at that period. On the arrival of the vessel at Spithead, the court-martial was held on board on the 23d of December, 1805. After the witnesses had been examined, Sir Robert entered upon his defence. He quoted several recent cases in which our best naval commanders had refrained from the renewal of an encounter without any impeachment of the propriety of their forbearance. He stated that the Rochefort and Ferrol squadrons, to the number of twenty sail of the line, were supposed to be at sea when the battle of the 22d of July occurred; and that had he waited for their junction with the enemy, whose force already so greatly exceeded his own, he must have been utterly overpowered. Even had he been only disabled in the encounter, these united squadrons might have pressed onward for Ireland, or even for England, and thus have facilitated the long-threatened invasion of our country. In this case, it was necessary to preserve his fleet for ulterior operations instead of risking a renewal of the action, and the more especially, that on the morning after the battle, he found himself eight or nine miles to leeward, while some of his ships were so greatly disabled, that they could not carry sufficient sail to windward, and others were wholly out of sight. Matters being such, and believing that the design of the enemy was to reach Ferrol, and there unite with the blockaded squadron, he had done what he could: he had thrown himself between the port of Ferrol and the combined fleet for two days under an easy press of sail, neither offering nor shunning an encounter; and as often as the enemy menaced a renewal of action, he had accepted the challenge by hauling up his wind. All this he stated at large, and with the most convincing perspicuity; and at the close he burst forth with indignant eloquence upon the wrong with which himself and his brave companions had been treated, and the manner in which his despatches had been mutilated, and some important parts of them suppressed. But his arguments and his eloquence were in vain; a scape-goat was needed to carry off upon its innocent head the manifold blunders of the admiralty, and Sir Robert Calder had been selected for this office. His defence accordingly was overruled, and on the 26th the following sentence was pronounced:—"The court is of opinion, that the charge of not having done his utmost to renew the engagement, and to take and destroy every ship of the enemy, has been proved against the said Vice-admiral Sir Robert Calder; that it appears that his conduct has not been actuated either by cowardice or disaffection, but has arisen solely from error in judgment, and is highly censurable, and doth adjudge him to be severely reprimanded; and the said Vice-admiral Sir Robert Calder is hereby severely reprimanded accordingly."

It would be ridiculous, in the present day, when

the conduct of this gallant admiral is so well understood, and the greatness of his services so thoroughly appreciated, to allude to the injustice of such a sentence. It stands solitary and aloof, with the brand upon its forehead, and can only now condemn none but its authors. In the defence of Sir Robert Calder, we perceive that he had made an indignant allusion to the mutilation and curtailment of his despatches. This serious charge unfortunately was too true, and the admiralty itself was guilty of the crime. In their published account, the following passage of Sir Robert was retained:—"The enemy are now in sight to windward; and when I have secured the captured ships, and put the squadron to rights, I shall endeavour to avail myself of any further opportunity that may offer to give you a further account of these combined squadrons." In consequence of this announcement, a meeting between the hostile fleets for the renewal of the contest was anticipated; and as the hours went onward, the public ear in London was on the alert for the firing of the Tower guns, to announce a glorious victory. But the following passage, which would have abated this ardour, was omitted:—"At the same time, it will behove me to be on my guard against the combined squadrons in Ferrol, as I am led to believe that they have sent off one or two of their crippled ships last night for that port; therefore, possibly I may find it necessary to make a junction with you immediately off Ushant with the whole squadron." Had the admiralty published this part of Sir Robert's despatch, as they ought to have done, the nation would have seen at once that it was impossible, with only fourteen ships ready for action, to encounter the opposite eighteen, should the latter be joined by the twenty line-of-battle ships whose arrival was hourly expected. But a sensation was to be produced, and hope excited, and therefore the chilling paragraph was fraudulently withheld. And when no victory ensued, the perpetrators of this deed endeavoured to conceal their blunder, and avert the public wrath, by a condemnation that ought to have fallen, not upon Calder, but upon themselves.

Although the sentence of the court-martial was expected to soothe the popular disappointment, and for a short time succeeded, yet let no statesman venture upon such experiments with the British public. John Bull is reckoned indeed the very type of gullibility, and with good reason; but the honesty of heart in which this weakness originates is sure to recover the ascendancy, and examine the trial anew, in which case, the false witness and unrighteous judge have equally cause to tremble. Thus it was in the case of Sir Robert Calder. The public began to suspect that he had been unjustly dealt with, and further inquiry only strengthened the suspicion. The same feeling, although more tardily, at length obtained entrance into head-quarters; and in 1810 Mr. Yorke, then first lord of the admiralty, ventured to express his conviction that Sir Robert had deserved very different treatment. In parliament, also, the same sentiment was expressed by the Duke of Norfolk and the Earl of Romney. The result of this return to a proper feeling, was the offer to Sir Robert, on the part of Mr. Yorke, of the important command of Plymouth, which the former accepted as a testimony of his acquittal and recognition of his public services and worth. After Sir Robert Calder had held the appointment for three years, he died at Holt, near Bishop's Waltham, in Hants, on the 31st of August, 1818, in the 74th year of his age.

CALDERWOOD, DAVID, an eminent divine and ecclesiastical historian. The year of his birth,

the place of his education, and the character of the family from which he was descended, are all alike unknown. The earliest ascertained fact of his life is his settlement, in 1604, as minister of Crailling, in Roxburghshire. Being a zealous supporter of the principles of presbytery, he set himself with all his might to oppose the designs of the court, which aimed at the introduction of a moderate episcopacy. In 1608, when the Bishop of Glasgow paid an official visit to the synod of Merse and Teviotdale, Mr. Calderwood gave in a paper declining his jurisdiction. For this act of contumacy he was confined for several years to his parish, so as to prevent his taking any share in the public business of the church. In the summer of 1617 King James paid a visit to Scotland, for the purpose of urging forward his episcopal innovations. On this occasion, while the parliament was considering how to intrust powers of ecclesiastical supremacy to the king, the clergy were convened to deliberate in a collusive manner, so that everything might appear to be done with the consent and approbation of the church. This assemblage was attended by the bishops, who affected to consider it an imitation of the *convocations* of the English Church. Calderwood, being now permitted to move about, though still forbidden to attend synods or presbyteries, appeared at this meeting, which he did not scruple to proclaim as in no respect a convocation, but simply a free assembly of the clergy. Finding himself opposed by some friends of the bishops, Mr. Calderwood took leave of them in a short but pithy speech, allusive to the sly attempts of the king to gain the clergy, by heightening their stipends:—"It was absurd," he said, "to see men sitting in silks and satins, crying poverty in the kirk, while purity was departing." He assisted, however, at another meeting of the clergy, where it was resolved to deliver a protest to parliament against a particular *article*, or *bill*, by which the power of framing new laws for the church was to be intrusted to an ecclesiastical council appointed by the king. This protest was signed by Mr. Archibald Simpson, as representing all the rest, who, for his justification, furnished him with a roll containing their own signatures. One copy of the document was intrusted to a clergyman of the name of Hewat, who, having a seat in parliament, undertook to present it. Another remained with Mr. Simpson, in case of accident. Mr. Hewat's copy having been torn in a dispute with Archbishop Spottiswoode, Mr. Simpson presented his, and was soon after called before the tyrannical court of high commission, as a stirrer up of sedition. Being pressed to give up the roll containing the names of his abettors, he acknowledged it was now in the hands of Mr. David Calderwood, who was then cited to exhibit the said roll, and, at the same time, to answer for his seditious and mutinous behaviour. The commission court sat at St. Andrews, and the king having come there himself, had the curiosity to examine Mr. Calderwood in person. Some of the persons present came up to the peccant divine, and, in a friendly manner, counselled him to "come in the king's will," that his majesty might pardon him. But Mr. Calderwood entertained too strong a sense of the propriety and importance of what he had been doing, to yield up the point in this manner. "That which was done," he said, "was done with deliberation." In the conversation which ensued betwixt the king and him, the reader will be surprised to find many of the most interesting points of modern liberty asserted with a firmness and dignity worthy of an ancient Roman.

King. What moved you to protest?

Calderwood. An article concluded among the laws of the articles.

King. But what fault was there in it?

Calderwood. It cutteth off our General Assemblies.

King. (After inquiring how long Mr. Calderwood had been a minister.) Hear me, Mr. David, I have been an older keeper of General Assemblies than you. A General Assembly serveth to preserve doctrine in purity from error and heresy, the kirk from schism, to make confessions of faith, to put up petitions to the king in parliament. But as for matters of order, rites, and things indifferent in kirk policy, they may be concluded by the king, with advice of bishops and a choice number of ministers.

Calderwood. Sir, a General Assembly should serve, and our General Assemblies have served these fifty-six years, not only for preserving doctrine from error and heresy, but also to make canons and constitutions of all rites and orders belonging to the kirk. As for the second point, as by a competent number of ministers may be meant a General Assembly, so also may be meant a fewer number of ministers than may make up a General Assembly.

The king then challenged him for some words in the protestation.

Calderwood. Whatsoever was the phrase of speech, we meant nothing but to protest that we would give passive obedience to his majesty, but could not give active obedience to any unlawful thing which should flow from that article.

King. Active and passive obedience!

Calderwood. That is, we will rather suffer than practise.

King. I will tell thee, man, what is obedience. The centurion, when he said to his servants, to this man, go, and he goeth; to that man, come, and he cometh: that is obedience.

Calderwood. To suffer, sir, is also obedience; howbeit, not of that same kind. And that obedience, also, was not absolute, but limited, with exception of a countermand from a superior power.

Secretary. Mr. David, let alone [cease]; confess your error.

Calderwood. My lord, I cannot see that I have committed any fault.

King. Well, Mr. Calderwood, I will let you see that I am gracious and favourable. That meeting shall be condemned before ye be condemned; all that are in the file shall be filed before ye be filed, provided ye will conform.

Calderwood. Sir, I have answered my libel. I ought to be urged no further.

King. It is true, man, ye have answered your libel; but consider I am here; I may demand of you when and what I will.

Calderwood. Surely, sir, I get great wrong, if I be compelled to answer here in judgment to any more than my libel.

King. Answer, sir! ye are a refractor: the Bishop of Glasgow, your ordinary, and the Bishop of Caithness, the moderator of your presbytery, testify ye have kept no order; ye have repaired neither to presbyteries nor synods, and in no wise conform.

Calderwood. Sir, I have been confined these eight or nine years; so my conformity or nonconformity, in that point, could not be well known.

King. Good faith, thou art a very knave. See these self-same puritans; they are ever playing with equivocations.

Finally, the king asked, "If ye were relaxed, will ye obey or not?"

Calderwood. Sir, I am wronged, in that I am forced to answer questions beside the libel; yet, seeing I must answer, I say, sir, I shall either obey

you, or give a reason wherefore I disobey; and, if I disobey, your majesty knows I am to lie under the danger as I do now.

King. That is, to obey either actively or passively.

Calderwood. I can go no further.

He was then removed. Being afterwards called up, and threatened with deprivation, he declined the authority of the bishops to that effect; for which contumacy he was first imprisoned in St. Andrews, and then banished from the kingdom. When we read such conversations as the above, we can scarcely wonder at the civil war which commenced twenty years afterwards, or that the efforts of the Stuarts to continue the ancient arbitrary government of England were finally ineffectual.

Mr. Calderwood continued to reside in Holland from the year 1619 till after the death of King James, in 1625. Before leaving his country he published a book on the Perth assembly, for which he would certainly have been visited with some severe punishment, if he had not been quick to convey himself beyond seas. In 1623 he published, in Holland, his celebrated treatise, entitled, *Altare Damascenum*, the object of which was to expose the insidious means by which the polity of the English church had been intruded upon that of Scotland. King James is said to have been severely stung in conscience by this work. He was found very pensive one day by an English prelate, and being asked why he was so, answered, that he had just read the *Altar at Damascus*. The bishop desired his majesty not to trouble himself about that book, for he and his brethren would answer it. "Answer that, man!" cried the king sharply; "how can ye? there is nothing in it but Scripture, reason, and the fathers." An attempt was made, however, to do something of this kind. A degraded Scottish gentleman, named Scott, being anxious to ingratiate himself at court, published a recantation as from the pen of Mr. Calderwood, who, he believed and alleged, was just dead. There was only one unfortunate circumstance against Mr. Scott. Mr. Calderwood soon let it be known that he was still alive, and of the same way of thinking as ever. The wretched impostor is said to have then gone over to Holland and sought for Mr. Calderwood, in order to render his work true by assassinating him. But this red ink postscript was never added, for the divine had just returned to his native country.

Mr. Calderwood lived in a private manner at Edinburgh for many years, chiefly engaged, it is supposed, in the unobtrusive task of compiling a history of the Church of Scotland, from the death of James V. to that of James VI. His materials for this work lay in Knox's *History*, Mr. James Melville's *Observations*, Mr. John Davidson's *Diary*, the acts of parliament and assembly, and other state documents.

The work, in its original form, was long deemed too large for publication, although manuscript copies were preserved in the archives of the church, Glasgow university, the Advocates' Library, and the library of the British Museum, London. At length, however, the copy in the last-mentioned place was published by the Wodrow Society in 1843. On the breaking out of the troubles in 1638, Mr. Calderwood appeared on the public scene as a warm promoter of all the popular measures. At the Glasgow assembly in that year, and on many future occasions, his acquaintance with the records of the church proved of much service. He now also resumed his duty as a parish minister, being settled at Pencaitland, in East Lothian. In 1643 he was appointed one of the committee for drawing up the directory for public worship, and in 1646 an ab-

tract of his church history was published under the care of the General Assembly. At length, in 1651, while Cromwell's army occupied the Lothians, Mr. Calderwood retired to Jedburgh, where, in the immediate neighbourhood of the scene of his earliest ministrations, he sickened and died at a good old age.

CALLANDER, JOHN, of Craigforth, an eminent antiquary, was born in the early part of the eighteenth century. He was the descendant of John Callander, his majesty's master-smith in Scotland, who seems to have been an industrious money-making person, and who, tradition says, acquired part of his fortune from a mistake on the part of government in paying in pounds *sterling* an account which had been stated in *Scots* money. The estate of Craigforth, which originally belonged to Lord Elphinstone, was in 1684 purchased by Mr. Alexander Higgins, an advocate, who became embarrassed by the purchase, and conveyed his right to — Callander, from whom he had obtained large advances of money. From that period the estate has remained in the possession of the family, notwithstanding the strenuous exertions of Higgins to regain it; and of this family the subject of the present memoir was the representative.¹ Of his private history, very little has been collected; nor would it probably have much interest to our readers.² The next work published by him was *Terra Australis Cognita, or Voyages to the Terra Australis, or Southern Hemisphere, during the 16th, 17th, and 18th centuries*, Edinburgh, 1766; 3 vols. 8vo, a work translated from the French of De Brosses. It was not till thirteen years afterwards that he gave to the world his *Essay towards a Literal English Version of the New Testament in the Epistle to the Ephesians*, printed in quarto at Glasgow, in 1779. This very singular production proceeds upon the principle of adhering rigidly to the order of the Greek words, and abandoning entirely the English idiom. As a specimen of the translation, the 31st verse of chapter v. is here transcribed. "Because of this shall leave a man, the father of him, and the mother, and he shall be joined to the wife of him, and they shall be even the two into one flesh." The notes to the work are in Greek, "a proof, certainly," as has been judiciously remarked, "of Mr. Callander's learning, but not of his wisdom" (*Orme's Bibliotheca Biblica*, p. 74). After it followed the work by which Mr. Callander is best known: *Two Ancient Scottish Poems: The Gaberlunzie Man, and Christ's Kirk on the Green, with notes and observations*. Edin. 1782, 8vo. It would seem that he had for some time meditated a dictionary of the Scottish language, of which he intended this as a specimen, but which he never prepared for publication. His principle, as an etymologist, which consists "in deriving the words of every language from the radical sounds of the first or original tongue, as it was spoken by Noah and the builders of Babel," is generally considered fanciful, and several instances have been given by Chalmers and others of the absurdity of his derivations.

In April, 1781, Mr. Callander was, without any

solicitation on his part, elected a fellow of the Society of Scottish Antiquaries, which had been formed in the preceding November, by the late Earl of Buchan; and in the first list of office-bearers his name appears as secretary for foreign correspondence. Along with several other donations, he presented them, in August of the same year, with the *Fragmenta* already mentioned, and with the MS. notes on *Paradise Lost*, in nine folio volumes. For more than forty years these annotations remained unnoticed in the society's possession, but at length a paper, written, it is supposed, by the respectable biographer of the Admirable Crichton and Sir Thomas Craig, appeared in *Blackwood's Magazine*, in which Callander is charged with having, without acknowledgment, been indebted for a large proportion of his materials to the labours of Patrick Hume, a Scotsman who published a huge folio of 321 pages on the same subject, at London, in 1695. At the suggestion of Mr. David Laing, a committee was appointed in 1826 to examine the MSS., and present the result to the society. From the report³ drawn up by Mr. Laing, it appears that, although there are some passages in which the analogy between Callander's remarks and those of Hume are so close that no doubt can be entertained of the one having availed himself of the notes of the other, yet that the proportion to the whole mass is so small, that it cannot be affirmed with truth the general plan or the largest portion of the materials of the work are derived from that source. On the other hand, it is candidly admitted that no acknowledgment of his obligations to his fellow-countrymen are made by Mr. Callander; but unfortunately a preface, in which such obligations are generally noticed, has never been written for, or, at all events, is not attached to, the work. According to the testimony of Bishop Newton, the work by Hume contains "gold;" but it is concealed among "infinite heaps of rubbish;" to separate them was the design of the learned bishop, and our author seems to have acted precisely upon the same principle. Nor does he confine himself merely to the commentaries of Hume; he avails himself as often, and to as great an extent, of the notes of Newton, and of the other contemporary critics.

Besides the works already mentioned, Mr. Callander seems to have projected several others. A specimen of a *Bibliotheca Septentrionalis* was printed in folio in 1778. *Proposals for a History of the Ancient Music of Scotland, from the age of the venerable Ossian, to the beginning of the sixteenth century*, in quarto, 1781; and a specimen of a Scoto-gothic glossary is mentioned in a letter to the Earl of Buchan in 1781. He also wrote "*Vindicia Miltonianæ*, or a refutation of the charges brought against Milton by [the infamous] William Lauder." The publication of this work was, however, rendered unnecessary by the appearance of the well-known vindication by Dr. Douglas, afterwards Bishop of Salisbury. This was, perhaps, fortunate for its author; not aware of Lauder's character, he had taken it for granted that all his quotations from Milton's works were correct, but he soon found that he had defended the poet where "he stood in no need of any apology to clear his fame." It is probably hardly worth mentioning, that he also projected an edition of Sir David Lindsay's *Satyre*, to be accompanied by a life of Lindsay from the pen of George Paton, which he does not seem to have accomplished.

"Mr. Callander," says the editor of *Paton's Letters*,⁴

¹ *Letters from Bishop Percy, &c., to George Paton*. Preface, p. viii.

² Though a member of the Scottish bar, the early part of his life seems to have been devoted to classical pursuits, in which it is acknowledged he made great proficiency. A considerable portion of the results of these studies was presented by him to the Society of Scottish Antiquaries, in August, 1781. His MSS., which are entitled *Spicilegia Antiquitatis Græcæ, sive ex Veteribus Poetis Deperdita Fragmenta*, are in five volumes, folio. The same researches were afterwards directed to the illustration of Milton's *Paradise Lost*, of which a specimen, containing his annotations on the first book, was printed at Glasgow, by Messrs. Foulis, in 1730 (4to, p. 167). Of these notes an account will afterwards be given.

³ See *Trans. of the Soc. of Scot. Antiq.* vol. 3, part i. pp. 84-89.
⁴ *Letters from Thomas Percy, D.D., afterwards Bishop of Dromore, John Callander, of Craigforth, Esq., David Herd, and others, to George Paton*. Edinburgh, 1830, 12mo, p. x.

"was, for many years, particularly distinguished for his companionable qualities. He had a taste for music, and was an excellent performer on the violin. Latterly he became very retired in his habits, saw little company, and his mind was deeply affected by a religious melancholy, which entirely unfitted him for society. He died at a good old age, upon the 14th September, 1789. By his wife, who was of the family of Livingston of Westquarter, he had seventeen children. His great-grandson is at present in possession of the estate."

CAMERON, DONALD, of Lochiel. This gallant Highland chief, who united such amiable manners and attractive accomplishments to the proverbial hardihood and valour of his race, that his name has descended to us under the title of "the gentle Lochiel," occupies the most conspicuous place in the history of the unfortunate rebellion of 1745; and may be considered as the fairest type of those chivalrous men by whom such a romantic lustre has been thrown over Jacobite loyalty and devotedness. He was grandson of that Sir Ewen Cameron, chief of Lochiel, of whom so many remarkable stories have been told, that he passes among Lowlanders as the Amadis de Gaul, or Guy of Warwick of the Highlands. Not the least remembered of these was his supreme contempt for Saxon effeminacy, so that, in a night bivouac among the snow, he kicked a snowball from under his son's head exclaiming, "What, are you become so luxurious that you cannot sleep without a pillow?" John Cameron of Lochiel, the father of Donald, for the share he had taken in the rebellion of 1715, was obliged to escape to France, and in consequence of his attainder, the subject of this notice succeeded to the estates of his ancestors, and chieftainship of the clan. On account of his father being still alive, he was commonly called by the Highlanders "Young Lochiel," although he was of mature age when he entered the field; but the precise year of his birth we are unable to discover.

As the grandfather and father of Donald had been steadfast adherents to the cause of the Stuarts, and as the clan Cameron was both numerous and powerful, the Chevalier de St. George opened a correspondence with the present chief, and invested him with full powers to negotiate in Scotland for the restoration of the exiled dynasty. Such was the state of affairs when the young Pretender, accompanied by only seven attendants, landed upon the western coast, and sent tidings to all his adherents in the neighbourhood of his arrival and its purposes. They were astounded at the intelligence. Had he come at the head of a strong reinforcement of foreign troops, and supplied with money for the expenses of a campaign, the whole Highlands might have been armed in his cause, and the result would scarcely have been doubtful; but, on the present occasion, the Highland chieftains well knew that the hope of overturning three kingdoms by their own resources was utter madness, and that the attempt would only precipitate themselves and their followers into certain destruction. But now the prince was among them, and all but alone: he had thrown himself upon their loyalty, and could they requite it with ingratitude? Such was the generous disinterested feeling with which the chiefs embarked in this desperate undertaking, and not from overweening confidence in their own valour, or hope of the rewards of conquest. They saw nothing before them but death on the field or the scaffold; and although their first success tended to remove these gloomy forebodings, they returned in full strength with the retreat from Derby, and were confirmed upon the field of Culloden.

In all these fears Lochiel fully participated. As soon, therefore, as he heard of the prince's arrival, he sent his brother, Dr. Archibald Cameron, to warn him of the consequences of the enterprise. This the Doctor did faithfully and earnestly; he even told the prince that his brother could not and would not join him under such circumstances. But he spoke to the son of a doomed race, whom no warnings could enlighten. Still, however, Charles felt that without the co-operation of Lochiel it was useless to advance, and he therefore sent Macdonald the younger, of Scothowe, requesting a personal interview with the Cameron at Borodale. Perhaps he was aware of the marvellous power that accompanies the petitions of a prince. The chief complied with an invitation which he could not well refuse, but he set out with a firm resolution to have nothing to do with the prince's undertaking. This he expressed to his brother, John Cameron of Fassefern, upon whom he called on his way. As soon as Fassefern learned that Charles had arrived without money, arms, or troops, he approved of his brother's purpose not to join the expedition, and advised him to communicate this by letter; but when Lochiel persisted in continuing his journey to Borodale, as the best opportunity for justifying his refusal, Fassefern replied, "Brother, I know you better than you know yourself. If this prince once sets his eyes upon you, he will make you do whatever he pleases."

In the interview that followed between the prince and his chivalrous adherent, this prediction was too well verified. The latter stated that, as his royal highness had come without the promised supplies in men and money, the Highland chiefs were released from their engagements; and he advised Charles to return to France, and await a more favourable opportunity. To this the prince replied that no such opportunity as the present might again occur—that most of the British troops were abroad, and the few newly-raised regiments at home would be unable to withstand the army of Highlanders that could be brought into the field, and that a few advantages at the outset would insure him effectual assistance both at home and from abroad. Unpersuaded by these arguments, which were more showy than solid, Lochiel advised a middle course: this was, that the prince should dismiss his attendants and his ship, the *Doutelle*, back to France, so that it might be thought that himself had returned with them, and that, in the meantime, his highness might remain concealed in the Highlands until the court of France could send over an armament to their aid. This, however, Charles rejected, declaring that the court of France would never believe he had a party in Scotland until an insurrection had actually commenced. Thus driven from every point of dissuasion, Lochiel had recourse to his last inducement, by entreating that his highness would remain at Borodale until the Highland chiefs could be assembled, when they might deliberate in concert what was best to be done; but this prudent proposal Charles also refused. "In a few days," he exclaimed, "and with the few friends that I have, I will erect the royal standard, and proclaim to the people of Britain that Charles Stuart is come over to claim the crown of his ancestors—to win it, or to perish in the attempt: Lochiel, whom my father has often told me was our firmest friend, may stay at home, and from the newspapers learn the fate of his prince." This taunt, which touched so keenly the honour of the high-minded chief, decided him at once, and he cried, "No! I'll share the fate of my prince; and so shall every man over whom nature or fortune has given me any power!" In this way "the gentle Lochiel" was over-

thrown and taken captive by what many will reckon a mere punctilio. In his case, too, it was the more to be regretted, as not only his own fate and that of his clan was at stake, but the introduction of a civil war, which, but for his example, would either not have happened, or have begun and terminated in a petty skirmish.

Having gained over a chief so influential, the Pretender thought that he might proceed at once to action, and accordingly he announced his purpose to raise the royal standard on the 19th of August at Glenfinnan, where all his Highland adherents were warned to be in readiness. In the meantime Lochiel went home to muster his clan for the gathering. When the period arrived, Charles, who had now been three weeks in the Highlands without the secret being divulged, embarked from Kinlochmoidart, with twenty-five attendants in three boats, and reached Glenfinnan on the morning of the rendezvous. And dreary was the prospect that welcomed him to his expected kingdom, for he found himself in a dark narrow glen, bounded on both sides by high rocky mountains; and instead of the gallant muster of impatient clans by whom he hoped his coming would be greeted, there were no persons but the inhabitants of the few wretched hovels sprinkled at wide intervals along the glen, who stood at their doors, or among the distant precipices, to gaze at the arrival of the strangers. Dispirited at this appearance of remissness on the part of his friends, Charles retired to one of these hovels, where, after two anxious hours of suspense, his ears were gladdened by the sound of a distant bagpipe. It was the clan Cameron hastening to the trysting-place, with Lochiel at their head. They were from 700 to 800 strong, while in point of arms, discipline, and equipments, they formed the *élite* of that rebel army by which such singular successes were obtained both in Scotland and England. The Camerons also did not come to the meeting empty-handed, for they brought with them, as prisoners, a party of the royalist soldiers who had been surprised in the neighbourhood of Loch Lochie. On the arrival of Lochiel and his followers, Charles, without waiting for the rest of the clans, proclaimed war in due form against the "Elector of Hanover," raised his silk banner of white, blue, and red, and proclaimed his father sovereign of the British empire. After this ceremony new volunteers arrived, by which the prince soon found himself at the head of 1200 men. With such an army, where nearly one half were very imperfectly armed, and with only one guinea in his pocket when he reached the fair city of Perth, the young Chevalier commenced his daring march for the overthrow of three kingdoms. It has often been reckoned one of the maddest freaks in military history; but how would it have been characterized had it succeeded, which it almost did? The wonderful successes of Montrose, with means as inadequate, were not yet forgotten in the Highlands.

The rest of the career of Lochiel is so closely connected with the events of the campaign of 1745, that a full detail of them would necessarily include a narrative of the whole rebellion. We can, therefore, only specify a few particulars. The town of Perth, which fell into the hands of the insurgents after they commenced their descent into the Lowlands, was taken by a party of the Camerons. On crossing the Forth the great difficulty was to restrain the Highlanders from plundering, as they committed much havoc among the sheep, which they hunted and shot as if they had been hares, and cooked in their own rude fashion. A summary act of justice executed by Lochiel upon one of these marauders is thus

described by Dugald Graham, the Homer of this eventful rebellion:—

"This did enrage the Camerons' chief,
To see his men so play the thief;
And finding one into the act,
He fired, and shot him through the back;
'Then to the rest himself addressed:—
'This is your lot, I do protest,
Who'er amongst you wrongs a man;
Pay what you get, I tell you plain;
For yet we know not friend or foe,
Nor how all things may chance to go.'"

It was a just and humane order, enforced by politic considerations, and as such it must have greatly aided in procuring for the wild miscellaneous army that character for forbearance by which it was afterwards distinguished. On reaching Edinburgh, which had closed its gates and refused to surrender, Charles, with the army of Sir John Cope at his heels, was anxious to place his wild followers within the walls of the ancient capital, but without the bloodshed and odium of a storm. This resolution, which was so congenial to the character of Lochiel, the gallant chief undertook to execute; and with a select detachment of 900 men he marched by night to the city gates, which, however, were too jealously watched to give him access. While he waited for an opportunity, a hackney coach, filled with deputies, that had been sent from the town-council to the prince's head-quarters, and were returning home by the Canongate, suddenly appeared. As soon as the gate opened to admit them, a party of Highlanders rushed in, disarmed the guards in a twinkling, and cleared the way for their fellows. In this way Edinburgh was captured without shedding a drop of blood, or even making so much noise as to disturb the sleep of its inhabitants. Lochiel again appears on the very foreground of Prestonpans, the victory of which was chiefly attributed to his clan, by whom the dragoons were routed, and the royalist foot left wholly uncovered. In charging cavalry, which was a new event in Highland warfare, he ordered his men to rush forward boldly and strike at the noses of the horses with their broadswords, without caring about the riders; and the consequence was, that these formidable-looking cavaliers were chased off the field by a single onset. In the unsuccessful expedition into England which followed this victory, the Camerons were always found at their post, while the conduct of their chief was distinguished throughout the advance and retreat by the same combination of prudence, courage, and clemency. Strangely enough, however, it happened that he, the "gentle Lochiel," was, on one occasion, mistaken for a cannibal or an ogre. In England fearful tales had been reported of the Highlanders, and among others, that they had claws instead of hands, and fed upon human flesh. On that account, one evening, when he entered the lodging that had been assigned to him, the poor landlady threw herself at his feet, and besought him, with uplifted hands and weeping eyes, to take her life, but spare her two children. Astonished at this, he asked her what she meant, when she told him everybody had said that the Highlanders ate children as their common food. A few kind words sufficed to disabuse her; and opening the door of a press, she cried with a voice of joy, "Come out, children, the gentleman won't eat you," upon which the two little prisoners emerged from their concealment and fell at his feet.

At the winding up of this wild tragedy on Culloden Moor, Lochiel had his full share of disappointment and disaster. He was one of the advocates of a night surprise of the English army, and when the unsuccessful attempt was made, he was one of its principal

leaders. In the battle that followed next day the Camerons were described by eye-witnesses as advancing to the charge "with their bonnets pulled tightly over their brows, their bodies half-bent, their shields raised so as to cover the head and vital parts, and their broadswords quivering in their nervous gripe: they sprang forward upon their foes like crouching tigers, their eyes gleaming with an expression fierce and terrific to the last degree." The whole front rank fell; and, in spite of their devoted efforts to protect their chief, Lochiel himself received several severe wounds in the legs, and was carried off the field. Such was the termination which his own prudence had apprehended from the beginning, without needing the predictions of "the death-boding seer," but to which he had committed himself from a mistaken sense of honour. After this defeat, by which all the adherents of the Pretender were scattered and hunted upon their native mountains, Lochiel, having skulked for two months in his own district, at last withdrew to the borders of Rannoch, where he took up his abode in a miserable hovel on the side of the mountain Benalder, to be cured of his wounds. Here, on the morning of the 30th of August, 1746, he and his few attendants were startled by the unwelcome apparition of a party of men advancing to the dwelling; and thinking that they were enemies from the camp a few miles distant, who had tracked them to their hiding-place, they prepared to receive them with a volley of musketry. Their weapons were pointed for the occasion, and in another instant would have given fire, when Lochiel suddenly stopped them: he discovered that the strangers were no other than the prince himself, Dr. Cameron his brother, and a few guides, who had heard in their wanderings of his whereabouts, and were coming to visit him! One moment more and Charles might have lain stretched on the heath by the hand of the best and most devoted of his followers. On discovering who his visitor was, the chief, who was lamed in the ancles from his wounds, limped out to welcome him, and would have knelt upon the ground, when Charles prevented him with, "No, my dear Lochiel; we do not know who may be looking from the top of yonder hills, and if they see any such motions, they will immediately conclude that I am here." Seldom have prince and subject met under such circumstances of adversity. As the royal wanderer had long been a stranger to a comfortable meal, some minced collops were fried for him with butter in a large saucepan, to which the luxury of a silver spoon was added; and poor Charles, after partaking very heartily of these savoury viands, could not help exclaiming, "Now, gentlemen, I live like a prince!" Turning to Lochiel, he asked, "Have you always fared so well during your retreat?" "Yes, sir," replied the chief, "for nearly three months past I have been herabout with my cousin Cluny; he has provided for me so well, that I have had plenty of such as you see, and I thank heaven your royal highness has got through so many dangers to take a part."

Soon after this meeting, two vessels of war, despatched by the French government, arrived, and in these Charles and about 100 of his adherents, of whom Lochiel was one, embarked at Lochnanuagh, on the 20th of September. Soon after his arrival in France, Lochiel received the command of a regiment in the French service, to which the young Chevalier wished a title of British nobility to be added; but this the prince's father refused, observing very justly, that it would create envy in the other Highland chiefs, who might expect a similar distinction; and that Lochiel's interest and

reputation in his own country, and his being at the head of a regiment in France, would give him more consideration there than any empty title he could bestow. By this time, however, the mere question of a coronet was of little importance to the brave and good Lochiel, for he died in his place of exile in 1748. At his death he left two sons, of whom John, the eldest, succeeded to his father's regiment, but died in early life. Charles, the younger, who succeeded to the family claims of his brother, obtained leases from the British crown of parts of the family estate upon very easy terms, and received a commission in the 71st Highlanders, to which regiment he added a company of clansmen of his own raising. On the regiment being ordered for foreign service, his Camerons refused to embark without him, upon which, though he was dangerously ill in London, he hurried down to Glasgow to appease them, but found that this had been successfully done by Colonel Fraser of Lovat, the commander of the regiment. This violent exertion, however, was too much for his exhausted strength, so that he died soon afterwards. Nothing, it is said, could exceed the enthusiasm with which the arrival of Charles Cameron was welcomed by the citizens of Glasgow, for it was their conviction that his father had prevented their city from being plundered by the rebel army in 1745.

Another member of the Lochiel family still remains to be mentioned; this was Dr. Archibald Cameron, whose name has already occurred more than once in the course of this notice. After having endured his share of the hardships which befell the rebel army, and aided the prince in his wanderings among the Highlands, he was one of those who embarked at Lochnanuagh, and reached France in safety. Some doubtful causes, however, not sufficiently explained, but which seem to have been altogether unconnected with politics, induced him to return to Scotland privately in 1749, and subsequently in 1753; but at his last visit he was apprehended, tried at London, and sentenced to be hanged at Tyburn, as one of the attainted persons who had been "out" in 1745. He was the last victim of the fears or the vengeance of government; and many even of its best friends thought that after so long an interval, and on account of his well-known amiable character, his life ought to have been spared.

CAMERON, SIR EWEN, of Lochiel. This fierce and gallant warrior, the grandfather of the "gentle Lochiel," in whom the character of a Highland chief of the seventeenth century was impersonated, was born at Castle Culchorn, a seat of the Earl of Breadalbane, in February, 1629. After the fashion of the Highlanders, who were wont so to distinguish the members of the same clan and name, he was called Ewen Dhu, from his dark complexion. When about the age of twelve, the education of the young chief was undertaken by the Marquis of Argyll, in whose hands he was a hostage for the peaceable behaviour of the Camerons; but Sir Ewen showed more inclination for hunting, shooting, fencing, and such exercises, than for books or the society of learned men. At the age of fourteen he was taken by the marquis to England, to be entered as a student at Oxford; but his lordship soon found the difficulty of managing such a ward, for on reaching Stirling on their journey, the youth, tired of the coercion of a coach, slipped away from his guardian, and travelled a whole day through the town and its neighbourhood, although the pestilence was at that time in Stirling, and of a most infectious and destructive character. At Berwick, where they made

a long stay, he entered into so many quarrels with the young gentlemen of the town, upon questions connected with the honour of his country, as to endanger his being knocked on the head; so that the marquis would not allow him to stir out of doors without two or three of his armed servants as a guard. The invasion of the Marquis of Montrose into Scotland, and the events preceding the battle of Philiphaugh, prevented the buoyant Highlander from prosecuting his journey and astonishing the peaceful students of Oxford; and having visited Sir Robert Spotswood in prison after the defeat of Montrose, he was by that able and wily politician estranged from Argyle and his party and converted into a royalist.

When the young chief of the Camerons had reached the age of eighteen, he was set free from the guardianship of Argyle, and sent back to his own people. From want of other active occupation, he commenced a regular warfare against the wild beasts of the district, and made fearful destruction of the wolves and foxes, the last wolf seen in the Highlands having been slain with his own hand. The prospect of higher game, to which this was only preparatory, soon offered itself, by the refusal of Macdonald of Keppoch, chief of a tribe of the Macdonalds, to pay the annuity of a mortgage held by the chief of the Camerons upon an estate belonging to the former. To enforce payment, Lochiel came down into the territories of his creditor at the head of some hundreds of armed Camerons, and Keppoch was fain to listen to reason. Another similar quarrel occurred with Macdonald of Glengarry, who refused to pay some arrears of feu-duty which he owed to the chief of the Camerons, as lord-paramount of the territory of Knoidart, which the other occupied. Lochiel in this case used the same figure of persuasion, and with the same result. The attempt of the Earl of Glencairn, after the defeat of Charles II. at Worcester, to revive his majesty's cause in the Highlands was more attractive, however, to Lochiel than such petty feuds about money with his brother chiefs; and when the earl raised the royal standard in 1652, he joined him at the head of 700 of his clansmen. In this campaign, the courage of the young Lochiel, daring even to the extreme of rashness, was so much in character with the enterprise as to attract general notice. After behaving with remarkable gallantry in the engagement in which Glencairn was defeated, Lochiel, who had been successful against the English soldiers in several important skirmishes, withdrew his clan in safety to Lochaber. Instead of warring for the restoration of the king, he was now reduced to the necessity of acting upon the defensive, as General Monk, after reducing the Lowlands, was resolved to complete the conquest of the whole of Scotland by also reducing the Highlands to obedience.

This resolution of the English commonwealth was followed up with a military skill and also with a promptitude which the Highlanders had never witnessed in former invasions of their mountain territories; and either dismayed by the unexpected advance of Monk, or allured by the advantages they might derive from supporting the stronger cause, they either remained inactive or favoured the invaders. A detachment from the English army had advanced as far as Aberchelder, where Fort Augustus now stands, and Lochiel, who had mustered his followers for resistance, depended upon the co-operation of Keppoch and Glengarry, who had leagued with him against the common enemy. But these chiefs at such a crisis were more mindful of their former feud with Lochiel, than the safety or honour of their country, and neither of them would give him aid.

Thus left to his own resources, he was obliged to change the plan of combined warfare into a guerilla resistance, for which the country was well adapted. Annoyed by such an enemy, Monk endeavoured to disarm him by tempting promises. He offered to bestow upon him two large estates, to pay all his debts, and invest him with what rank in the army he pleased; but finding the gallant young chief inaccessible to such bribes, the English general returned to his previous design of establishing such a strong garrison at Inverlochry, as would either reduce the Highlands to his mercy, or compel Lochiel to retire and confine himself to his own district. Two thousand of his most effective troops were accordingly conveyed thither by sea, with workmen and everything necessary for the erection of a fort and suitable defences.

The establishment of this formidable bridle of the Highlands was now the chief eyesore of the patriotic Lochiel; upon it his whole attention was concentrated, and to prevent or retard its completion became the chief object of his daring spirit of enterprise. While he hovered in the neighbourhood upon the watch, he learned that 300 men of the garrison, accompanied by some workmen, were to be sent across the loch, to bring in provisions, and cut down trees for timber in building; and although he had not more than thirty-eight men at hand, having dismissed the rest on various commissions, he resolved with his small handful to attack the party. The arrangements of the enemy favoured his design, for, dividing themselves, they sailed in two vessels to opposite sides of the loch, so that the vessel which landed on the side nearest to the Camerons had only 150 soldiers on board. Even yet, however, so great was the disparity in point of numbers, that some of the Camerons who had served with Montrose declared that the great marquis himself had never ventured such an attempt. Lochiel, however, persisted in his purpose of attack, and as the clansmen were chiefly apprehensive that in such an enterprise their chief would perish along with them, he tied his younger brother Allan to a tree, to reserve him as the future head of the Camerons; and being unable to spare a man for the purpose, he appointed a little boy to attend him. After these preparations and precautions, the chief marched half a mile westward to the village of Achadale, which the English soldiers were at that moment in the act of pillaging, and judging this a favourable opportunity, he gave the signal of onset. A strange conflict immediately followed between the Highlanders, half of whom were only armed with bows and arrows, and the English, who were fully equipped and brave soldiers; but the latter, besides the unexpectedness of the attack, were confounded at the peculiar mode of a Highland assault, against which their discipline was rather a hindrance than a help. In the heat of the struggle Lochiel himself was in danger of being shot by an English musketeer, who had concealed himself behind a bush; but at this critical moment his brother Allan appeared, and shot the Englishman while the latter was about to pull the trigger. This arrival of Allan was owing to his impatience for the fight, in consequence of which he had prevailed upon the boy who waited on him to loose the cords with which he was tied to the tree, after which, although but a mere stripling, he plunged into the thickest of the conflict. Gallantly although the Highlanders contended with such odds, they were met with equal bravery, and it seemed as if discipline would at last prevail, for nothing disheartened them more than to see with what facility these Saxon enemies rallied when broken, and the courage with which they renewed the combat

instead of running away. But the nimbleness and ferocity of the Celts, and the advantage their strange mode of attack gave them, were finally successful; and the English, reduced to thirty-five men, fled in confusion to their ship, where they surrendered on the offer of quarter. Only four of the Camerons were lost in the action, and a fifth, who was Lochiel's foster-brother, who on observing an English officer taking aim at his chief, started forward, received the shot in his own bosom, and fell dead at the feet of his master. But such devotedness was so common among the Highlanders, that a different conduct would have formed a subject for their astonishment. With Highland devotedness we may also quote an instance of Highland simplicity. They had heard, and they believed, that the English had certain caudal appendages projecting from the quarter whence tails usually grow; and to find these they searched the dead bodies of the English with a solicitude worthy of the philosophic Lord Monboddo.

But of all the events of this remarkable skirmish, none was to be compared to a combat which took place between Lochiel and one of the enemy. He had given chase to a party along a by-way that led to a wood, and struck down two or three of the fugitives, when he was suddenly confronted by the officer of the party from behind a bush, where he had concealed himself. They were both alone, and between them a deadly conflict at once commenced. The combat was desperate, as each fought for life; and the advantages on both sides were so equal, that it was both long and doubtful. The English officer was superior both in strength and stature, but Lochiel excelled him in activity, so that at last, by a sudden stroke, he sent the sword out of the other's hand. On this the Englishman closed with his opponent, bore him to the ground, and fell with him, but uppermost; and in the close death-struggle they lay, until they both rolled into the channel of a dry brook, where Lochiel was almost helpless from the weight of the other, and the sharp stones upon which he had fallen. At last the Englishman got his right hand free, and drew his dagger; but just when he had raised his head in the act of dealing a fatal stab, Lochiel darted at the extended throat with his teeth, and bit with such bull-dog ferocity, as to tear away a whole mouthful of the officer's throat. This he afterwards declared was the sweetest bite that ever he had in his lifetime. It is needless, perhaps, to add that such a wound brought the combat to a close. This terrible duel Sir Walter Scott has copied in describing that between Roderick Dhu and Fitz-James. Great was now the renown of "the Cameron," who was extolled as the first of living heroes; and as his biographer expresses it, "his presence of mind in delivering himself from his terrible English antagonist, who had so much the advantage of him in everything but vigour and courage, by biting out his throat, was in every person's mouth." The garrison, when they saw the wounds of their dead companions, whose limbs were lopped off, and even their bodies almost cleft in twain, trembled at these evidences of the might of the mountain arm, and wondered what kind of mortals these Highlanders were who could deal such dreadful strokes.

In other skirmishes that followed Lochiel was so successful that his name became a word of terror to the garrison, so that they were cautious of venturing beyond the shelter of their walls. But the royalist cause, of which he was one of the most distinguished adherents, was weary of the struggle, and General Middleton, who had succeeded the Earl of Glencairn as its representative in Scotland, made submission to the existing government. Lochiel, thus finding himself
